LAMMPS DOCUMENTATION

About LAMMPS and this manual	1
I User Guide	5
1 Introduction	7
1.1 Overview of LAMMPS	7
1.2 What does a LAMMPS version mean	8
1.2.1 Identifying the Version	8
1.2.2 LAMMPS releases, branches, and tags	8
1.3 LAMMPS features	9
1.3.1 General features	9
1.3.2 Particle and model types	10
1.3.3 Interatomic potentials (force fields)	10
1.3.4 Atom creation	11
1.3.5 Ensembles, constraints, and boundary conditions	12
1.3.6 Integrators	12
1.3.7 Diagnostics	12
1.3.8 Output	12
1.3.9 Multi-replica models	13
1.3.10 Pre- and post-processing	13
1.3.11 Specialized features	13
1.4 LAMMPS non-features	14
1.5 LAMMPS portability and compatibility	15
1.5.1 Programming language standards	15
1.5.2 Build systems	15
1.5.3 Operating systems	16
1.5.4 Compilers	16
1.5.5 CPU architectures	16
1.5.6 Portability compliance	16
1.5.7 Code review and static code analysis	16
1.6 LAMMPS open-source license	17
1.6.1 GPL version of LAMMPS	17
1.6.2 LGPL version of LAMMPS	17
1.7 Authors of LAMMPS	18
1.8 Citing LAMMPS	19
1.8.1 Core Algorithms	19
1.8.2 DOI for the LAMMPS source code	19
1.8.3 Home page	20
1.8.4 Citing contributions	20
1.9 Additional website links	20

2	Install LAMMPS	21
2.1	Download an executable for Linux	21
2.1.1	Pre-built static Linux x86_64 executables	22
2.1.2	Pre-built Ubuntu and Debian Linux executables	22
2.1.3	Pre-built Fedora Linux executables	23
2.1.4	Pre-built EPEL Linux executable	23
2.1.5	Pre-built OpenSuse Linux executable	23
2.1.6	Gentoo Linux executable	24
2.1.7	Archlinux build-script	24
2.2	Download an executable for macOS	25
2.3	Download an executable for Windows	25
2.4	Download an executable for Linux or macOS via Conda	26
2.5	Download source and documentation as a tarball	26
2.6	Download the LAMMPS source with git	27
3	Build LAMMPS	31
3.1	Prerequisites	31
3.1.1	CMake build system	31
3.1.2	GNU build system	31
3.1.3	Compiler and OS compatibility	32
3.2	Build LAMMPS with CMake	32
3.2.1	Advantages of using CMake	32
3.2.2	Getting started	33
3.2.3	Configuration and build options	35
3.2.4	Build targets	35
3.2.5	Multi-configuration build systems	35
3.2.6	Installing CMake	36
3.3	Build LAMMPS with make	36
3.3.1	Make to CMake quick-start guide	37
3.3.2	Basics	37
3.3.3	Requirements	38
3.3.4	Getting started	38
3.3.5	Customized builds and alternate makefiles	39
3.4	Link LAMMPS as a library to another code	39
3.4.1	Link with LAMMPS as a static library	40
3.4.2	Link with LAMMPS as a shared library	41
3.5	Basic build options	42
3.5.1	Serial vs parallel build	42
3.5.2	Choice of compiler and compile/link options	44
3.5.3	Build the LAMMPS executable and library	46
3.5.4	Including or removing debug support	48
3.5.5	Build LAMMPS tools	48
3.5.6	Install LAMMPS after a build	49
3.6	Optional build settings	50
3.6.1	C++17 standard compliance	50
3.6.2	FFT library	50
3.6.3	Size of LAMMPS integer types and size limits	54
3.6.4	Read or write compressed files	55
3.6.5	Support for downloading files from the input	55
3.6.6	Prevent download of large potential files	56
3.6.7	Memory allocation alignment	56
3.6.8	Workaround for long long integers	57
3.6.9	Exception handling when using LAMMPS as a library	57
3.7	Include packages in build	57

3.7.1	Information for both build systems	59
3.7.2	CMake presets for installing many packages	59
3.7.3	Make shortcuts for installing many packages	61
3.8	Packages with extra build options	61
3.8.1	COMPRESS package	62
3.8.2	GRAPHICS package	62
3.8.3	GPU package	64
3.8.4	KIM package	67
3.8.5	KOKKOS package	68
3.8.6	LEPTON package	73
3.8.7	MACHDYN package	73
3.8.8	ML-IAP package	73
3.8.9	OPT package	74
3.8.10	PYTHON package	74
3.8.11	VORONOI package	75
3.8.12	ADIOS package	75
3.8.13	APIP package	76
3.8.14	COLVARS package	76
3.8.15	ELECTRODE package	77
3.8.16	MBX package	77
3.8.17	ML-PACE package	78
3.8.18	ML-POD package	79
3.8.19	ML-QUIP package	79
3.8.20	PLUMED package	80
3.8.21	H5MD package	81
3.8.22	ML-HDNNP package	81
3.8.23	ML-RUNNER package	82
3.8.24	INTEL package	83
3.8.25	MDI package	84
3.8.26	MISC package	84
3.8.27	MOLFILE package	85
3.8.28	NETCDF package	85
3.8.29	OPENMP package	86
3.8.30	QMMM package	86
3.8.31	RHEO package	87
3.8.32	SCAFACOS package	88
3.8.33	VTK package	88
3.9	Build the LAMMPS documentation	89
3.9.1	Build using GNU make	89
3.9.2	Build using CMake	90
3.9.3	Prerequisites for HTML	90
3.9.4	Prerequisites for PDF	91
3.9.5	Prerequisites for ePUB and MOBI	91
3.9.6	Instructions for Developers	91
3.10	Notes for building LAMMPS on Windows	93
3.10.1	General remarks	93
3.10.2	Running Linux on Windows	93
3.10.3	Using a GNU GCC ported to Windows	94
3.10.4	Using Microsoft Visual Studio	94
3.10.5	Using Intel oneAPI Compilers and Libraries	95
3.10.6	Using a cross-compiler	95
3.11	Notes for saving disk space when building LAMMPS from source	95
3.12	Development build options	96
3.12.1	Monitor compilation flags (CMake only)	97

3.12.2	Report missing and unneeded ‘#include’ statements (CMake only)	97
3.12.3	Address, Leak, Undefined Behavior, and Thread Sanitizer Support (CMake only)	97
3.12.4	Code Coverage and Unit Testing (CMake only)	98
3.12.5	Coding style utilities	104
3.12.6	Clang-format support	106
3.12.7	GitHub command-line interface	106
4	Run LAMMPS	109
4.1	Basics of running LAMMPS	109
4.2	Command-line options	110
4.3	Screen and logfile output	118
4.4	Error message output	121
4.4.1	A single line	121
4.4.2	Two lines	121
4.4.3	Three lines	121
4.4.4	Four lines	121
4.5	File formats used by LAMMPS	121
4.5.1	Character Encoding	122
4.5.2	Number Formatting	122
4.5.3	Input File	123
4.5.4	Data File	124
4.5.5	Molecule File	126
4.5.6	Restart File	127
4.5.7	JSON Dump Files	127
4.6	Running LAMMPS on Windows	128
5	Errors	131
5.1	Common issues that are often regarded as bugs	131
5.2	Errors and warnings details	133
5.2.1	General troubleshooting advice	134
5.2.2	Unknown identifier in data file	137
5.2.3	Incorrect format in ... section of data file	138
5.2.4	Illegal variable command: expected X arguments but found Y	138
5.2.5	Out of range atoms - cannot compute ...	138
5.2.6	Bond (or angle, dihedral, improper, cmap, or shake) atoms missing	138
5.2.7	Non-numeric atom coords or pressure or box dimensions - simulation unstable	139
5.2.8	Fix used in ... not computed at compatible time	139
5.2.9	Lost atoms ...	139
5.2.10	Too many neighbor bins	139
5.2.11	Unrecognized ... style ...	139
5.2.12	Energy or stress was not tallied by pair style	140
5.2.13	fmt::format_error	140
5.2.14	Substitution for illegal variable	140
5.2.15	Bond atom missing in image check or box size check	140
5.2.16	Cannot use neighbor bins - box size << cutoff	141
5.2.17	Did not assign all atoms correctly	141
5.2.18	Domain too large for neighbor bins	141
5.2.19	Step X: (h)bondchk failed	141
5.2.20	Numeric index X is out of bounds	141
5.2.21	Compute, fix, or variable vector or array is accessed out-of-range	142
5.2.22	Incorrect args for pair coefficients (also bond/angle/dihedral/improper coefficients)	142
5.2.23	Energy was not tallied on needed timestep (also virial, per-atom energy, per-atom virial)	142
5.2.24	Molecule auto special bond generation overflow	143
5.2.25	Molecule topology/atom exceeds system topology/atom	143

5.2.26	Molecule topology type exceeds system topology type	143
5.2.27	Molecule attributes do not match system attributes	143
5.2.28	Inconsistent image flags	143
5.2.29	No fixes with time integration, atoms won't move	144
5.2.30	System is not charge neutral, net charge = ...	144
5.2.31	Variable evaluation before simulation box is defined	144
5.2.32	Invalid thermo keyword 'X' in variable formula	144
5.2.33	One or more atoms are time integrated more than once	145
5.2.34	XXX command before simulation box is defined	145
5.2.35	XXX command after simulation box is defined	145
5.2.36	Error messages ending in 'Please contact the LAMMPS developers'	145
5.2.37	Neighbor list overflow, boost neigh_modify one	145
5.2.38	Variable ...: Compute/Fix ... does not compute requested property	146
5.2.39	The ... style ... is no longer available	146
5.3	Reporting bugs	146
5.4	Debugging crashes	147
5.4.1	Using the GDB debugger to get a stack trace	148
5.4.2	Using valgrind to get a stack trace	150
5.5	Debugging when LAMMPS appears to be stuck	151
5.6	Error messages	151
5.7	Warning messages	220
6	Commands	231
6.1	LAMMPS input scripts	231
6.2	Parsing rules for input scripts	232
6.3	Input script structure	234
6.3.1	Initialization	234
6.3.2	System definition	235
6.3.3	Simulation settings	235
6.3.4	Run a simulation	235
6.4	Commands by category	236
6.4.1	Initialization	236
6.4.2	Setup simulation box	236
6.4.3	Setup atoms	236
6.4.4	Force fields	236
6.4.5	Settings	236
6.4.6	Operations within timestepping (fixes) and diagnostics (computes)	236
6.4.7	Output	237
6.4.8	Actions	237
6.4.9	Input script control	237
6.5	General commands	238
6.6	Fix styles	238
6.7	Compute styles	240
6.8	Pair styles	241
6.9	Bond styles	243
6.10	Angle styles	243
6.11	Dihedral styles	244
6.12	Improper styles	244
6.13	KSpace styles	244
6.14	Dump styles	245
6.15	Removed commands and packages	246
6.15.1	amber2lmp tools	246
6.15.2	ATC, AWPMD, and POEMS packages	247
6.15.3	Neighbor style and comm mode multi/old	254

6.15.4	LAMMPS-GUI source code	254
6.15.5	GJF formulation in fix langevin	254
6.15.6	LAMMPS shell	254
6.15.7	i-PI tool	254
6.15.8	USER-REAXC package	255
6.15.9	MPIIO package	255
6.15.10	MSCG package	255
6.15.11	LATTE package	255
6.15.12	Minimize style fire/old	255
6.15.13	Pair style mesont/tpm, compute style mesont, atom style mesont	255
6.15.14	Box command	255
6.15.15	Reset_ids, reset_atom_ids, reset_mol_ids commands	256
6.15.16	MESSAGE package	256
6.15.17	REAX package	256
6.15.18	MEAM package	256
6.15.19	USER-CUDA package	256
6.15.20	Compute atom/molecule	256
6.15.21	Fix ave/spatial and fix ave/spatial/sphere	256
6.15.22	restart2data tool	257
7	Accelerate performance	259
7.1	Benchmarks	259
7.2	Measuring performance	260
7.2.1	Factors that influence performance	260
7.2.2	Examples comparing serial performance	261
7.2.3	Examples comparing parallel performance	262
7.2.4	Measuring performance of your input deck	263
7.3	General tips	264
7.4	Accelerator packages	265
7.4.1	GPU package	265
7.4.2	INTEL package	269
7.4.3	KOKKOS package	275
7.4.4	OPENMP package	282
7.4.5	OPT package	284
7.5	Comparison of various accelerator packages	287
8	Optional packages	289
8.1	Package details	293
8.1.1	ADIOS package	294
8.1.2	AMOEBA package	295
8.1.3	APIP package	295
8.1.4	ASPHERE package	296
8.1.5	BOCS package	297
8.1.6	BODY package	297
8.1.7	BPM package	298
8.1.8	BROWNIAN package	298
8.1.9	CG-DNA package	299
8.1.10	CG-SPICA package	299
8.1.11	CLASS2 package	300
8.1.12	COLLOID package	300
8.1.13	COLVARS package	300
8.1.14	COMPRESS package	301
8.1.15	CORESHELL package	301
8.1.16	DIELECTRIC package	302

8.1.17	DIFFRACTION package	303
8.1.18	DIPOLE package	303
8.1.19	DPD-BASIC package	303
8.1.20	DPD-MESO package	304
8.1.21	DPD-REACT package	304
8.1.22	DPD-SMOOTH package	305
8.1.23	DRUDE package	305
8.1.24	EFF package	306
8.1.25	ELECTRODE package	306
8.1.26	EXTRA-COMMAND package	307
8.1.27	EXTRA-COMPUTE package	307
8.1.28	EXTRA-DUMP package	307
8.1.29	EXTRA-FIX package	308
8.1.30	EXTRA-MOLECULE package	308
8.1.31	EXTRA-PAIR package	308
8.1.32	FEP package	308
8.1.33	GPU package	309
8.1.34	GRAPHICS package	309
8.1.35	GRANULAR package	310
8.1.36	GRANSURF package	311
8.1.37	H5MD package	311
8.1.38	INTEL package	311
8.1.39	INTERLAYER package	312
8.1.40	KIM package	312
8.1.41	KOKKOS package	313
8.1.42	KSPACE package	314
8.1.43	LATBOLTZ package	315
8.1.44	LEPTON package	315
8.1.45	MACHDYN package	316
8.1.46	MANIFOLD package	316
8.1.47	MANYBODY package	317
8.1.48	MBX Package	317
8.1.49	MC package	317
8.1.50	MDI package	318
8.1.51	MEAM package	319
8.1.52	MESONT package	319
8.1.53	MGPT package	320
8.1.54	MISC package	320
8.1.55	ML-HDNNP package	321
8.1.56	ML-RUNNER package	321
8.1.57	ML-IAP package	322
8.1.58	ML-PACE package	322
8.1.59	ML-POD package	323
8.1.60	ML-QUIP package	323
8.1.61	ML-RANN package	324
8.1.62	ML-SNAP package	324
8.1.63	ML-UF3 package	324
8.1.64	MOFFF package	325
8.1.65	MOLECULE package	325
8.1.66	MOLFILE package	326
8.1.67	NETCDF package	326
8.1.68	OPENMP package	327
8.1.69	OPT package	328
8.1.70	ORIENT package	328

8.1.71	PERI package	328
8.1.72	PHONON package	329
8.1.73	PLUGIN package	329
8.1.74	PLUMED package	330
8.1.75	PTM package	330
8.1.76	PYTHON package	330
8.1.77	QEQ package	331
8.1.78	QMMM package	331
8.1.79	QTB package	332
8.1.80	REACTION package	332
8.1.81	REAXFF package	333
8.1.82	REPLICA package	333
8.1.83	RHEO package	334
8.1.84	RIGID package	334
8.1.85	SCAFACOS package	335
8.1.86	SHOCK package	335
8.1.87	SMTBQ package	336
8.1.88	SPH package	336
8.1.89	SPIN package	337
8.1.90	SRD package	337
8.1.91	TALLY package	338
8.1.92	UEF package	338
8.1.93	VORONOI package	339
8.1.94	VTK package	339
8.1.95	YAFF package	339

9	Auxiliary tools	341
9.1	Pre-processing tools	341
9.2	Post-processing tools	341
9.3	Miscellaneous tools	342
9.4	Tool descriptions	342
9.4.1	binary2txt tool	342
9.4.2	ch2lmp tool	342
9.4.3	chain tool	342
9.4.4	LAMMPS coding standard	343
9.4.5	colvars tools	343
9.4.6	createatoms tool	343
9.4.7	drude tool	343
9.4.8	eam database tool	344
9.4.9	eam generate tool	344
9.4.10	eff tool	344
9.4.11	emacs tool	344
9.4.12	fep tool	345
9.4.13	i-PI tool	345
9.4.14	ipp tool	345
9.4.15	JSON support files	345
9.4.16	kate tool	347
9.4.17	LAMMPS-GUI	347
9.4.18	lmp2arc tool	347
9.4.19	lmp2cfg tool	347
9.4.20	Magic patterns for the “file” command	347
9.4.21	matlab tool	348
9.4.22	micelle2d tool	348
9.4.23	moltemplate tool	348

9.4.24	msi2lmp tool	348
9.4.25	Scripts for building LAMMPS when offline	349
9.4.26	phonon tool	350
9.4.27	polybond tool	350
9.4.28	pymol_asphere tool	350
9.4.29	python tool	351
9.4.30	Regression tester tool	351
9.4.31	replica tool	351
9.4.32	smd tool	351
9.4.33	spin tool	352
9.4.34	singularity/apptainer tool	352
9.4.35	stl_bin2txt tool	352
9.4.36	SWIG interface	352
9.4.37	tabulate tool	354
9.4.38	tinker tool	354
9.4.39	valgrind tool	354
9.4.40	vim tool	354
9.4.41	xmgrace tool	354
10	Howto discussions	355
10.1	General howto	355
10.1.1	Restart a simulation	355
10.1.2	Visualize LAMMPS snapshots	356
10.1.3	Basic workflow for loading LAMMPS trajectories in VMD	357
10.1.4	Advanced graphics features in the <i>dump image</i> command	358
10.1.5	Run multiple simulations from one input script	374
10.1.6	Multi-replica simulations	375
10.1.7	Library interface to LAMMPS	376
10.1.8	Coupling LAMMPS to other codes	376
10.1.9	Using LAMMPS with the MDI library for code coupling	377
10.2	Settings howto	379
10.2.1	2d simulations	379
10.2.2	Type labels	380
10.2.3	Triclinic (non-orthogonal) simulation boxes	382
10.2.4	Thermostats	387
10.2.5	Barostats	388
10.2.6	Walls	389
10.2.7	NEMD simulations	390
10.2.8	Long-range dispersion settings	391
10.2.9	Convert bulk system to slab	392
10.2.10	Broken Bonds	394
10.3	Analysis howto	395
10.3.1	Output from LAMMPS (thermo, dumps, computes, fixes, variables)	395
10.3.2	Output structured data from LAMMPS	401
10.3.3	Use chunks to calculate system properties	407
10.3.4	Using distributed grids	410
10.3.5	Calculate temperature	412
10.3.6	Calculate elastic constants	412
10.3.7	Calculate thermal conductivity	413
10.3.8	Calculate viscosity	414
10.3.9	Calculate diffusion coefficients	416
10.4	Force fields howto	417
10.4.1	Some general force field considerations	417
10.4.2	CHARMM, AMBER, COMPASS, ClassII-xe, DREIDING, and OPLS force fields	417

10.4.3	AMBER to LAMMPS Tutorial	423
10.4.4	AMOEBA and HIPPO force fields	432
10.4.5	TIP3P water model	437
10.4.6	TIP4P and OPC water models	440
10.4.7	TIP5P water model	445
10.4.8	SPC and SPC/E water model	447
10.4.9	Two-band (and multi-band) EAM potentials with hybrid/overlay	450
10.5	Packages howto	452
10.5.1	Finite-size spherical and aspherical particles	452
10.5.2	Granular models	455
10.5.3	Granular surfaces	457
10.5.4	Body particles	465
10.5.5	Bonded particle models	471
10.5.6	Polarizable models	474
10.5.7	Adiabatic core/shell model	475
10.5.8	Drude induced dipoles	479
10.5.9	Tutorial for Thermalized Drude oscillators in LAMMPS	479
10.5.10	Peridynamics with LAMMPS	486
10.5.11	Manifolds (surfaces)	502
10.5.12	Reproducing hydrodynamics and elastic objects (RHEO)	503
10.5.13	Magnetic spins	504
10.5.14	Adaptive-precision interatomic potentials (APIP)	505
10.5.15	Local Density Dependent Potentials via LDD	510
10.6	Tutorials howto	515
10.6.1	Using CMake with LAMMPS	515
10.6.2	LAMMPS GitHub tutorial	522
10.6.3	Using LAMMPS-GUI	535
10.6.4	Moltemplate Tutorial	535
10.6.5	LAMMPS Python Tutorial	543
10.6.6	Using LAMMPS on Windows 10 with WSL	554
11	Example scripts	565
11.1	Lowercase directories	565
11.2	Uppercase directories	568
II	Programmer Guide	569
1	LAMMPS Library Interfaces	571
1.1	LAMMPS C Library API	571
1.1.1	Creating or deleting a LAMMPS object	572
1.1.2	Executing commands	577
1.1.3	System properties	580
1.1.4	Per-atom properties	594
1.1.5	Computes, fixes, variables	595
1.1.6	Scatter/gather operations	606
1.1.7	Neighbor list access	620
1.1.8	Configuration information	622
1.1.9	Utility functions	629
1.1.10	Extending the C API	637
1.2	LAMMPS Python API	638
1.3	LAMMPS Fortran API	638
1.3.1	The <i>LIBLAMMPS</i> Fortran Module	638
1.3.2	Creating or deleting a LAMMPS object	639

1.3.3	Executing LAMMPS commands	640
1.3.4	Accessing system properties	641
1.3.5	The <i>LIBLAMMPS</i> module API	642
1.4	LAMMPS C++ API	688
1.4.1	Using the C++ API directly	689
1.4.2	Creating or deleting a LAMMPS object	689
1.4.3	Executing LAMMPS commands	689
2	Use Python with LAMMPS	691
2.1	Overview	691
2.2	Installation	692
2.2.1	Installing the LAMMPS Python Module and Shared Library	693
2.2.2	Extending Python to run in parallel	696
2.3	Run LAMMPS from Python	697
2.3.1	Running LAMMPS and Python in serial	697
2.3.2	Running LAMMPS and Python in parallel with MPI	698
2.3.3	Running Python scripts	698
2.3.4	Creating or deleting a LAMMPS object	699
2.3.5	Executing commands	700
2.3.6	System properties	701
2.3.7	Per-atom properties	702
2.3.8	Compute, fixes, variables	703
2.3.9	Scatter/gather operations	704
2.3.10	Neighbor list access	705
2.3.11	Configuration information	707
2.4	The <code>lammps</code> Python module	708
2.4.1	The <code>lammps</code> class API	708
2.4.2	Additional components of the <code>lammps</code> module	736
2.5	Extending the Python interface	738
2.6	Calling Python from LAMMPS	738
2.7	Output Readers	739
2.8	Example Python scripts	739
2.9	Using LAMMPS in IPython notebooks and Jupyter	740
2.9.1	Interactive Python Examples	741
2.10	Handling LAMMPS errors	741
2.11	Troubleshooting	742
2.11.1	Testing if Python can launch LAMMPS	742
3	Modifying & extending LAMMPS	743
3.1	Overview	743
3.2	Submitting new features for inclusion in LAMMPS	744
3.2.1	Communication with the LAMMPS developers	745
3.2.2	Time and effort required	745
3.2.3	Submission procedure	745
3.2.4	External contributions	745
3.2.5	Location of files: individual files and packages	745
3.2.6	Changes to core LAMMPS files	746
3.3	Requirements for contributions to LAMMPS	746
3.3.1	Motivation	746
3.3.2	Licensing requirements (strict)	746
3.3.3	Integration testing (strict)	747
3.3.4	Documentation (strict)	747
3.3.5	Build system (strict)	748
3.3.6	Command or style names, file names, and keywords (strict)	749

3.3.7	Programming style requirements (varied)	749
3.3.8	Examples (preferred)	749
3.3.9	Error or warning messages and explanations (preferred)	749
3.3.10	Citation reminder (optional)	750
3.3.11	Testing (optional)	750
3.4	LAMMPS programming style	750
3.4.1	Include files (varied)	750
3.4.2	Whitespace (preferred)	751
3.4.3	Constants (strongly preferred)	751
3.4.4	Placement of braces (strongly preferred)	752
3.4.5	Miscellaneous standards (varied)	752
3.5	Atom styles	753
3.6	Pair styles	755
3.7	Bond, angle, dihedral, improper styles	757
3.8	Compute styles	758
3.9	Fix styles	759
3.10	Input script command style	762
3.11	Dump styles	762
3.12	Kspace styles	763
3.13	Minimization styles	764
3.14	Region styles	765
3.15	Body styles	765
3.16	Granular Sub-Model styles	766
3.17	Thermodynamic output options	768
3.18	Variable options	769
4	Information for Developers	771
4.1	Source files	772
4.2	Class topology	772
4.3	Code design	775
4.3.1	Object-oriented code	776
4.3.2	I/O and output formatting	779
4.3.3	JSON format input and output	781
4.3.4	Memory management	781
4.4	Parallel algorithms	781
4.4.1	Partitioning	782
4.4.2	Communication	783
4.4.3	Neighbor lists	785
4.4.4	Long-range interactions	787
4.4.5	OpenMP Parallelism	789
4.5	Accessing per-atom data	791
4.5.1	Owned and ghost atoms	791
4.5.2	Atom indexing	791
4.5.3	Atom class versus AtomVec classes	792
4.6	Communication patterns	792
4.6.1	Owned and ghost atoms	792
4.6.2	Higher level communication	793
4.7	How a timestep works	795
4.8	Writing new styles	798
4.8.1	Writing new pair styles	798
4.8.2	Package and build system considerations	798
4.8.3	Case 1: a pairwise additive model	799
4.8.4	Case 2: a many-body potential	812
4.8.5	Case 3: a potential requiring communication	815

4.8.6	Case 4: potentials without a compute() function	816
4.8.7	Writing new bond, angle, dihedral, and improper styles	818
4.8.8	Case 1: Implementing a bond style	818
4.8.9	Case 2: Implementing an angle style	824
4.8.10	Case 3: Implementing a dihedral style	825
4.8.11	Case 4: Implementing an improper style	826
4.8.12	Writing a new fix style	828
4.8.13	Writing new compute styles	831
4.8.14	Case 1: A global scalar compute	832
4.8.15	Case 2: A per-atom compute	836
4.8.16	Notes on flags and output types	838
4.8.17	Writing a new command style	839
4.8.18	Case 1: Implementing the geturl command	839
4.8.19	Creating styles for the OPENMP package	844
4.8.20	Writing or updating documentation	849
4.8.21	Anatomy of a style documentation page	849
4.8.22	Integrating a new style into the command lists	853
4.8.23	Documenting an accelerated variant of an existing style	854
4.8.24	Adding and referencing example inputs	854
4.8.25	Other documentation that may need updating	854
4.8.26	Building and checking the documentation	855
4.9	Notes for developers and code maintainers	855
4.9.1	Reading and parsing of text and text files	855
4.9.2	Requesting and accessing neighbor lists	856
4.9.3	Errors, warnings, and informational messages	858
4.9.4	Choosing between a custom atom style, fix property/atom, and fix STORE/ATOM	860
4.9.5	Fix contributions to instantaneous energy, virial, and cumulative energy	860
4.9.6	KSpace PPPM FFT grids	862
4.10	Notes for updating code written for older LAMMPS versions	863
4.10.1	Setting flags in the constructor	864
4.10.2	Rename of pack/unpack_comm() to pack/unpack_forward_comm()	864
4.10.3	Use ev_init() to initialize variables derived from eflag and vflag	865
4.10.4	Use utils::count_words() functions instead of atom->count_words()	865
4.10.5	Use utils::numeric() functions instead of force->numeric()	866
4.10.6	Use utils::open_potential() function to open potential files	866
4.10.7	Use symbolic Atom and AtomVec constants instead of numerical values	866
4.10.8	Simplify customized error messages	867
4.10.9	Use of “override” instead of “virtual”	867
4.10.10	Simplified function names for forward and reverse communication	868
4.10.11	Simplified and more compact neighbor list requests	868
4.10.12	Split of fix STORE into fix STORE/GLOBAL and fix STORE/PERATOM	869
4.10.13	Rename of fix STORE/PERATOM to fix STORE/ATOM and change of arguments	870
4.10.14	Use Output::get_dump_by_id() instead of Output::find_dump()	870
4.10.15	Refactored grid communication using Grid3d/Grid2d classes instead of GridComm	871
4.10.16	FLERR as first argument to minimum image functions in Domain class	872
4.10.17	Use utils::logmesg() instead of error->warning()	872
4.11	Writing plugins	873
4.11.1	Members of lammpsplugin_t	873
4.11.2	Pair style example	874
4.11.3	Fix style example	874
4.11.4	Command style example	875
4.11.5	Additional Details	876
4.11.6	Compiling plugins	877
4.12	Adding tests for unit testing	877

4.12.1	Tests for utility functions	878
4.12.2	Tests for individual LAMMPS commands	880
4.12.3	Tests for the C-style library interface	881
4.12.4	Tests for the Python module and package	882
4.12.5	Tests for the Fortran interface	882
4.12.6	Tests for the C++-style library interface	882
4.12.7	Tests for reading and writing file formats	882
4.12.8	Tests for styles computing or modifying forces	882
4.12.9	Tests for granular (DEM) models	889
4.12.10	Tests for programs in the tools folder	892
4.12.11	Troubleshooting failed unit tests	893
4.13	C++ base classes	894
4.13.1	LAMMPS Class	894
4.13.2	LAMMPS Atom and AtomVec Base Classes	896
4.13.3	LAMMPS Input Base Class	901
4.13.4	Citation management for contributed features	902
4.14	Platform abstraction functions	904
4.14.1	Time functions	904
4.14.2	Platform information functions	904
4.14.3	File and path functions and global constants	905
4.14.4	Standard I/O function wrappers	908
4.14.5	Environment variable functions	909
4.14.6	Dynamically loaded object or library functions	910
4.14.7	Compressed file I/O functions	911
4.15	Utility functions	911
4.15.1	I/O with status check and similar functions	912
4.15.2	String to number conversions with validity check	914
4.15.3	String processing	917
4.15.4	Potential file functions	923
4.15.5	Argument processing	924
4.15.6	Convenience functions	927
4.15.7	Customized standard functions	930
4.16	Special Math functions	930
4.17	Tokenizer classes	932
4.18	Argument parsing classes	937
4.19	Safe pointer classes	940
4.20	File reader classes	942
4.21	Type label support	946
4.21.1	Overview	946
4.21.2	Integration with utils namespace	946
4.21.3	LabelMap class reference	948
4.22	Memory pool classes	953
4.23	Eigensolver functions	957
4.24	Communication buffer coding with <i>ubuf</i>	958
4.25	Internal Styles	958
4.25.1	DEPRECATED Styles	959
4.25.2	Internal fix styles	959
4.26	Use of distributed grids within style classes	960
4.26.1	Style commands	961
4.26.2	Grid data allocation and access	961
4.26.3	Grid class constructors	962
4.26.4	Grid class set methods	963
4.26.5	Grid class setup_grid method	964
4.26.6	More grid class set methods	965

4.26.7	Grid class get methods	965
4.26.8	Grid class owned/ghost communication	965
4.26.9	Grid class remap methods for load balancing	967
4.26.10	Grid class I/O methods	968
4.26.11	Style class grid access methods	969
4.26.12	Final notes	970

III Command Reference 973

1	Commands	975
1.1	angle_coeff command	975
1.1.1	Syntax	975
1.1.2	Examples	975
1.1.3	Description	975
1.1.4	Restrictions	976
1.1.5	Related commands	976
1.1.6	Default	976
1.2	angle_style command	976
1.2.1	Syntax	976
1.2.2	Examples	976
1.2.3	Description	976
1.2.4	Restrictions	978
1.2.5	Related commands	978
1.2.6	Default	978
1.3	angle_write command	978
1.3.1	Syntax	978
1.3.2	Examples	978
1.3.3	Description	979
1.3.4	Restrictions	979
1.3.5	Related commands	979
1.3.6	Default	979
1.4	atom_modify command	979
1.4.1	Syntax	979
1.4.2	Examples	980
1.4.3	Description	980
1.4.4	Restrictions	982
1.4.5	Related commands	982
1.4.6	Default	982
1.5	atom_style command	982
1.5.1	Syntax	982
1.5.2	Examples	983
1.5.3	Description	983
1.5.4	Atom style attributes	983
1.5.5	Particle size and mass	985
1.5.6	Additional information about specific atom styles	985
1.5.7	Restrictions	988
1.5.8	Related commands	988
1.5.9	Default	988
1.6	balance command	988
1.6.1	Syntax	988
1.6.2	Examples	989
1.6.3	Description	989
1.6.4	Restrictions	995

	1.6.5	Related commands	995
	1.6.6	Default	995
1.7		bond_coeff command	996
	1.7.1	Syntax	996
	1.7.2	Examples	996
	1.7.3	Description	996
	1.7.4	Restrictions	997
	1.7.5	Related commands	997
	1.7.6	Default	997
1.8		bond_style command	997
	1.8.1	Syntax	997
	1.8.2	Examples	997
	1.8.3	Description	997
	1.8.4	Restrictions	999
	1.8.5	Related commands	999
	1.8.6	Default	999
1.9		bond_write command	999
	1.9.1	Syntax	999
	1.9.2	Examples	999
	1.9.3	Description	999
	1.9.4	Restrictions	1000
	1.9.5	Related commands	1000
	1.9.6	Default	1000
1.10		boundary command	1000
	1.10.1	Syntax	1000
	1.10.2	Examples	1000
	1.10.3	Description	1000
	1.10.4	Restrictions	1001
	1.10.5	Related commands	1001
	1.10.6	Default	1002
1.11		change_box command	1002
	1.11.1	Syntax	1002
	1.11.2	Examples	1002
	1.11.3	Description	1003
	1.11.4	Restrictions	1006
	1.11.5	Related commands	1007
	1.11.6	Default	1007
1.12		clear command	1007
	1.12.1	Syntax	1007
	1.12.2	Examples	1007
	1.12.3	Description	1007
	1.12.4	Restrictions	1007
	1.12.5	Related commands	1007
	1.12.6	Default	1007
1.13		comm_modify command	1007
	1.13.1	Syntax	1007
	1.13.2	Examples	1008
	1.13.3	Description	1008
	1.13.4	Restrictions	1010
	1.13.5	Related commands	1010
	1.13.6	Default	1010
1.14		comm_style command	1010
	1.14.1	Syntax	1010
	1.14.2	Examples	1010

	1.14.3	Description	1010
	1.14.4	Restrictions	1011
	1.14.5	Related commands	1011
	1.14.6	Default	1011
1.15		compute command	1011
	1.15.1	Syntax	1011
	1.15.2	Examples	1011
	1.15.3	Description	1011
	1.15.4	Restrictions	1018
	1.15.5	Related commands	1018
	1.15.6	Default	1018
1.16		compute_modify command	1018
	1.16.1	Syntax	1018
	1.16.2	Examples	1019
	1.16.3	Description	1019
	1.16.4	Restrictions	1019
	1.16.5	Related commands	1019
	1.16.6	Default	1019
1.17		create_atoms command	1019
	1.17.1	Syntax	1019
	1.17.2	Examples	1021
	1.17.3	Description	1021
	1.17.4	Restrictions	1028
	1.17.5	Related commands	1028
	1.17.6	Default	1028
1.18		create_bonds command	1028
	1.18.1	Syntax	1028
	1.18.2	Examples	1029
	1.18.3	Description	1029
	1.18.4	Restrictions	1031
	1.18.5	Related commands	1031
	1.18.6	Default	1031
1.19		create_box command	1031
	1.19.1	Syntax	1031
	1.19.2	Examples	1032
	1.19.3	Description	1032
	1.19.4	Restrictions	1034
	1.19.5	Related commands	1034
	1.19.6	Default	1034
1.20		delete_atoms command	1034
	1.20.1	Syntax	1034
	1.20.2	Examples	1035
	1.20.3	Description	1035
	1.20.4	Restrictions	1037
	1.20.5	Related commands	1037
	1.20.6	Default	1037
1.21		delete_bonds command	1037
	1.21.1	Syntax	1037
	1.21.2	Examples	1038
	1.21.3	Description	1038
	1.21.4	Restrictions	1039
	1.21.5	Related commands	1039
	1.21.6	Default	1039
1.22		dielectric command	1040

1.22.1	Syntax	1040
1.22.2	Examples	1040
1.22.3	Description	1040
1.22.4	Restrictions	1040
1.22.5	Related commands	1040
1.22.6	Default	1040
1.23	dihedral_coeff command	1040
1.23.1	Syntax	1040
1.23.2	Examples	1040
1.23.3	Description	1041
1.23.4	Restrictions	1041
1.23.5	Related commands	1042
1.23.6	Default	1042
1.24	dihedral_style command	1042
1.24.1	Syntax	1042
1.24.2	Examples	1042
1.24.3	Description	1042
1.24.4	Restrictions	1044
1.24.5	Related commands	1044
1.24.6	Default	1044
1.25	dihedral_write command	1044
1.25.1	Syntax	1044
1.25.2	Examples	1044
1.25.3	Description	1045
1.25.4	Restrictions	1045
1.25.5	Related commands	1045
1.25.6	Default	1045
1.26	dimension command	1045
1.26.1	Syntax	1045
1.26.2	Examples	1046
1.26.3	Description	1046
1.26.4	Restrictions	1046
1.26.5	Related commands	1046
1.26.6	Default	1046
1.27	displace_atoms command	1046
1.27.1	Syntax	1046
1.27.2	Examples	1047
1.27.3	Description	1047
1.27.4	Restrictions	1048
1.27.5	Related commands	1048
1.27.6	Default	1048
1.28	dynamical_matrix command	1048
1.28.1	Syntax	1048
1.28.2	Examples	1049
1.28.3	Description	1049
1.28.4	Restrictions	1049
1.28.5	Related commands	1049
1.28.6	Default	1050
1.29	echo command	1050
1.29.1	Syntax	1050
1.29.2	Examples	1050
1.29.3	Description	1050
1.29.4	Restrictions	1050
1.29.5	Related commands	1050

	1.29.6	Default	1050
1.30		fix command	1050
	1.30.1	Syntax	1050
	1.30.2	Examples	1051
	1.30.3	Description	1051
	1.30.4	Restrictions	1061
	1.30.5	Related commands	1061
	1.30.6	Default	1061
1.31		fix_modify command	1061
	1.31.1	Syntax	1061
	1.31.2	Examples	1062
	1.31.3	Description	1062
	1.31.4	Restrictions	1064
	1.31.5	Related commands	1064
	1.31.6	Default	1064
1.32		fitpod command	1064
	1.32.1	Syntax	1064
	1.32.2	Examples	1064
	1.32.3	Description	1064
	1.32.4	POD Potential	1067
	1.32.5	Training	1067
	1.32.6	Validation	1068
	1.32.7	Restrictions	1068
	1.32.8	Related commands	1068
	1.32.9	Default	1068
1.33		geturl command	1068
	1.33.1	Syntax	1068
	1.33.2	Examples	1068
	1.33.3	Description	1069
	1.33.4	Restrictions	1069
	1.33.5	Related commands	1069
	1.33.6	Default	1070
1.34		group command	1070
	1.34.1	Syntax	1070
	1.34.2	Examples	1071
	1.34.3	Description	1071
	1.34.4	Restrictions	1075
	1.34.5	Related commands	1075
	1.34.6	Default	1075
1.35		group2ndx command	1075
1.36		ndx2group command	1075
	1.36.1	Syntax	1075
	1.36.2	Examples	1075
	1.36.3	Description	1075
	1.36.4	File Format	1076
	1.36.5	Restrictions	1076
	1.36.6	Related commands	1076
	1.36.7	Default	1076
1.37		hyper command	1076
	1.37.1	Syntax	1076
	1.37.2	Examples	1077
	1.37.3	Description	1077
	1.37.4	Restrictions	1078
	1.37.5	Related commands	1078

	1.37.6	Default	1078
1.38		if command	1079
	1.38.1	Syntax	1079
	1.38.2	Examples	1079
	1.38.3	Description	1079
	1.38.4	Restrictions	1082
	1.38.5	Related commands	1082
	1.38.6	Default	1082
1.39		improper_coeff command	1082
	1.39.1	Syntax	1082
	1.39.2	Examples	1082
	1.39.3	Description	1082
	1.39.4	Restrictions	1083
	1.39.5	Related commands	1083
	1.39.6	Default	1083
1.40		improper_style command	1083
	1.40.1	Syntax	1083
	1.40.2	Examples	1083
	1.40.3	Description	1083
	1.40.4	Restrictions	1084
	1.40.5	Related commands	1085
	1.40.6	Default	1085
1.41		include command	1085
	1.41.1	Syntax	1085
	1.41.2	Examples	1085
	1.41.3	Description	1085
	1.41.4	Restrictions	1085
	1.41.5	Related commands	1085
	1.41.6	Default	1085
1.42		info command	1085
	1.42.1	Syntax	1085
	1.42.2	Examples	1086
	1.42.3	Description	1086
	1.42.4	Restrictions	1087
	1.42.5	Related commands	1087
	1.42.6	Default	1087
1.43		jump command	1087
	1.43.1	Syntax	1087
	1.43.2	Examples	1088
	1.43.3	Description	1088
	1.43.4	Restrictions	1089
	1.43.5	Related commands	1089
	1.43.6	Default	1089
1.44		kim command	1090
	1.44.1	Syntax	1090
	1.44.2	Examples	1090
	1.44.3	Description	1090
	1.44.4	Using OpenKIM IMs with LAMMPS (<i>kim init, kim interactions</i>)	1091
	1.44.5	Using OpenKIM Web Queries in LAMMPS (<i>kim query</i>)	1095
	1.44.6	Accessing KIM Model Parameters from LAMMPS (<i>kim param</i>)	1099
	1.44.7	Writing material properties in standard KIM Property Instance format (<i>kim property</i>)	1102
	1.44.8	Citation of OpenKIM IMs	1108
	1.44.9	Restrictions	1108
	1.44.10	Related commands	1108

1.45	kspace_modify command	1109
1.45.1	Syntax	1109
1.45.2	Examples	1110
1.45.3	Description	1110
1.45.4	Restrictions	1115
1.45.5	Related commands	1115
1.45.6	Default	1115
1.46	kspace_style command	1116
1.46.1	Syntax	1116
1.46.2	Examples	1118
1.46.3	Description	1118
1.46.4	Restrictions	1124
1.46.5	Related commands	1124
1.46.6	Default	1124
1.47	label command	1125
1.47.1	Syntax	1125
1.47.2	Examples	1125
1.47.3	Description	1125
1.47.4	Restrictions	1125
1.47.5	Related commands	1126
1.47.6	Default	1126
1.48	labelmap command	1126
1.48.1	Syntax	1126
1.48.2	Examples	1126
1.48.3	Description	1126
1.48.4	Restrictions	1127
1.48.5	Related commands	1127
1.48.6	Default	1127
1.49	lattice command	1127
1.49.1	Syntax	1127
1.49.2	Examples	1128
1.49.3	Description	1128
1.49.4	Restrictions	1132
1.49.5	Related commands	1132
1.49.6	Default	1132
1.50	log command	1132
1.50.1	Syntax	1132
1.50.2	Examples	1132
1.50.3	Description	1132
1.50.4	Restrictions	1133
1.50.5	Related commands	1133
1.50.6	Default	1133
1.51	mass command	1133
1.51.1	Syntax	1133
1.51.2	Examples	1133
1.51.3	Description	1133
1.51.4	Restrictions	1134
1.51.5	Related commands	1134
1.51.6	Default	1134
1.52	mdi command	1134
1.52.1	Syntax	1134
1.52.2	Examples	1134
1.52.3	Description	1135
1.52.4	Restrictions	1139

	1.52.5	Related commands	1139
	1.52.6	Default	1139
1.53		min_modify command	1139
	1.53.1	Syntax	1139
	1.53.2	Examples	1140
	1.53.3	Description	1140
	1.53.4	Restrictions	1141
	1.53.5	Related commands	1141
	1.53.6	Default	1142
1.54		min_style spin command	1142
1.55		min_style spin/cg command	1142
1.56		min_style spin/lbfgs command	1142
	1.56.1	Syntax	1142
	1.56.2	Examples	1142
	1.56.3	Description	1142
	1.56.4	Restrictions	1143
	1.56.5	Related commands	1143
	1.56.6	Default	1143
1.57		min_style cg command	1143
1.58		min_style hftn command	1143
1.59		min_style sd command	1143
1.60		min_style quickmin command	1143
1.61		min_style fire command	1143
1.62		<i>min_style spin</i> command	1144
1.63		<i>min_style spin/cg</i> command	1144
1.64		<i>min_style spin/lbfgs</i> command	1144
	1.64.1	Syntax	1144
	1.64.2	Examples	1144
	1.64.3	Description	1144
	1.64.4	Restrictions	1145
	1.64.5	Related commands	1145
	1.64.6	Default	1146
1.65		minimize command	1146
	1.65.1	Syntax	1146
	1.65.2	Examples	1146
	1.65.3	Description	1146
	1.65.4	Restrictions	1150
	1.65.5	Related commands	1150
	1.65.6	Default	1150
1.66		molecule command	1151
	1.66.1	Syntax	1151
	1.66.2	Examples	1151
	1.66.3	Description	1151
	1.66.4	Format of a native molecule file	1154
	1.66.5	Format of a JSON molecule file	1162
	1.66.6	Restrictions	1168
	1.66.7	Related commands	1168
	1.66.8	Default	1168
1.67		neb command	1168
	1.67.1	Syntax	1168
	1.67.2	Examples	1169
	1.67.3	Description	1169
	1.67.4	Restrictions	1173
	1.67.5	Related commands	1173

	1.67.6	Default	1173
1.68		neb/spin command	1174
	1.68.1	Syntax	1174
	1.68.2	Examples	1174
	1.68.3	Description	1174
	1.68.4	Restrictions	1178
	1.68.5	Related commands	1178
	1.68.6	Default	1178
1.69		neigh_modify command	1179
	1.69.1	Syntax	1179
	1.69.2	Examples	1180
	1.69.3	Description	1180
	1.69.4	Restrictions	1182
	1.69.5	Related commands	1182
	1.69.6	Default	1183
1.70		neighbor command	1183
	1.70.1	Syntax	1183
	1.70.2	Examples	1183
	1.70.3	Description	1183
	1.70.4	Restrictions	1184
	1.70.5	Related commands	1184
	1.70.6	Default	1184
1.71		newton command	1184
	1.71.1	Syntax	1184
	1.71.2	Examples	1185
	1.71.3	Description	1185
	1.71.4	Restrictions	1185
	1.71.5	Related commands	1185
	1.71.6	Default	1185
1.72		next command	1185
	1.72.1	Syntax	1185
	1.72.2	Examples	1185
	1.72.3	Description	1185
	1.72.4	Restrictions	1187
	1.72.5	Related commands	1187
	1.72.6	Default	1187
1.73		package command	1187
	1.73.1	Syntax	1188
	1.73.2	Examples	1190
	1.73.3	Description	1191
	1.73.4	Restrictions	1198
	1.73.5	Related commands	1199
	1.73.6	Defaults	1199
1.74		pair_coeff command	1199
	1.74.1	Syntax	1199
	1.74.2	Examples	1200
	1.74.3	Description	1200
	1.74.4	Restrictions	1201
	1.74.5	Related commands	1201
	1.74.6	Default	1201
1.75		pair_modify command	1202
	1.75.1	Syntax	1202
	1.75.2	Examples	1202
	1.75.3	Description	1202

	1.75.4	Restrictions	1206
	1.75.5	Related commands	1206
	1.75.6	Default	1206
1.76		pair_style command	1206
	1.76.1	Syntax	1206
	1.76.2	Examples	1206
	1.76.3	Description	1206
	1.76.4	Restrictions	1216
	1.76.5	Related commands	1216
	1.76.6	Default	1216
1.77		pair_write command	1217
	1.77.1	Syntax	1217
	1.77.2	Examples	1217
	1.77.3	Description	1217
	1.77.4	Restrictions	1218
	1.77.5	Related commands	1218
	1.77.6	Default	1218
1.78		partition command	1218
	1.78.1	Syntax	1218
	1.78.2	Examples	1218
	1.78.3	Description	1218
	1.78.4	Restrictions	1219
	1.78.5	Related commands	1219
	1.78.6	Default	1219
1.79		plugin command	1219
	1.79.1	Syntax	1219
	1.79.2	Examples	1219
	1.79.3	Description	1219
	1.79.4	Restrictions	1220
	1.79.5	Related commands	1220
	1.79.6	Default	1220
1.80		prd command	1221
	1.80.1	Syntax	1221
	1.80.2	Examples	1221
	1.80.3	Description	1221
	1.80.4	Restrictions	1224
	1.80.5	Related commands	1224
	1.80.6	Default	1224
1.81		print command	1225
	1.81.1	Syntax	1225
	1.81.2	Examples	1225
	1.81.3	Description	1225
	1.81.4	Restrictions	1226
	1.81.5	Related commands	1226
	1.81.6	Default	1226
1.82		processors command	1226
	1.82.1	Syntax	1226
	1.82.2	Examples	1227
	1.82.3	Description	1227
	1.82.4	Restrictions	1230
	1.82.5	Related commands	1231
	1.82.6	Default	1231
1.83		python command	1231
	1.83.1	Syntax	1231

	1.83.2	Examples	1232
	1.83.3	Description	1232
	1.83.4	Restrictions	1240
	1.83.5	Related commands	1240
	1.83.6	Default	1240
1.84		quit command	1240
	1.84.1	Syntax	1240
	1.84.2	Examples	1241
	1.84.3	Description	1241
	1.84.4	Restrictions	1241
	1.84.5	Related commands	1241
	1.84.6	Default	1241
1.85		read_data command	1241
	1.85.1	Syntax	1241
	1.85.2	Examples	1242
	1.85.3	Description	1242
	1.85.4	Reading multiple data files	1243
	1.85.5	Format of a data file	1244
	1.85.6	Format of the header of a data file	1245
	1.85.7	Header specification of the simulation box size and shape	1246
	1.85.8	Meaning of other header keywords	1249
	1.85.9	Format of the body of a data file	1249
	1.85.10	Restrictions	1263
	1.85.11	Related commands	1264
	1.85.12	Default	1264
1.86		read_dump command	1264
	1.86.1	Syntax	1264
	1.86.2	Examples	1265
	1.86.3	Description	1265
	1.86.4	Restrictions	1269
	1.86.5	Related commands	1269
	1.86.6	Default	1269
1.87		read_restart command	1269
	1.87.1	Syntax	1269
	1.87.2	Examples	1269
	1.87.3	Description	1269
	1.87.4	Restrictions	1272
	1.87.5	Related commands	1272
	1.87.6	Default	1272
1.88		region command	1272
	1.88.1	Syntax	1272
	1.88.2	Examples	1274
	1.88.3	Description	1274
	1.88.4	Restrictions	1278
	1.88.5	Related commands	1278
	1.88.6	Default	1278
1.89		region2vmd command	1278
	1.89.1	Syntax	1278
	1.89.2	Examples	1279
	1.89.3	Description	1279
	1.89.4	Restrictions	1280
	1.89.5	Related commands	1280
	1.89.6	Defaults	1280
1.90		replicate command	1280

	1.90.1	Syntax	1280
	1.90.2	Examples	1280
	1.90.3	Description	1281
	1.90.4	Restrictions	1282
	1.90.5	Related commands	1282
	1.90.6	Default	1282
1.91		rerun command	1282
	1.91.1	Syntax	1282
	1.91.2	Examples	1283
	1.91.3	Description	1283
	1.91.4	Restrictions	1285
	1.91.5	Related commands	1285
	1.91.6	Default	1285
1.92		reset_atoms command	1285
	1.92.1	Syntax	1285
	1.92.2	Examples	1286
	1.92.3	Description	1286
	1.92.4	Restrictions	1288
	1.92.5	Related commands	1288
	1.92.6	Defaults	1288
1.93		reset_timestep command	1288
	1.93.1	Syntax	1288
	1.93.2	Examples	1289
	1.93.3	Description	1289
	1.93.4	Restrictions	1289
	1.93.5	Related commands	1289
	1.93.6	Default	1289
1.94		restart command	1289
	1.94.1	Syntax	1289
	1.94.2	Examples	1290
	1.94.3	Description	1290
	1.94.4	Restrictions	1292
	1.94.5	Related commands	1292
	1.94.6	Default	1292
1.95		run command	1292
	1.95.1	Syntax	1292
	1.95.2	Examples	1292
	1.95.3	Description	1293
	1.95.4	Restrictions	1295
	1.95.5	Related commands	1295
	1.95.6	Default	1295
1.96		run_style command	1295
	1.96.1	Syntax	1295
	1.96.2	Examples	1296
	1.96.3	Description	1296
	1.96.4	Restrictions	1299
	1.96.5	Related commands	1299
	1.96.6	Default	1300
1.97		set command	1300
	1.97.1	Syntax	1300
	1.97.2	Examples	1303
	1.97.3	Description	1303
	1.97.4	Restrictions	1309
	1.97.5	Related commands	1309

	1.97.6	Default	1309
1.98		shell command	1309
	1.98.1	Syntax	1309
	1.98.2	Examples	1309
	1.98.3	Description	1310
	1.98.4	Restrictions	1310
	1.98.5	Related commands	1311
	1.98.6	Default	1311
1.99		special_bonds command	1311
	1.99.1	Syntax	1311
	1.99.2	Examples	1311
	1.99.3	Description	1311
	1.99.4	Restrictions	1314
	1.99.5	Related commands	1314
	1.99.6	Default	1314
1.100		suffix command	1314
	1.100.1	Syntax	1314
	1.100.2	Examples	1315
	1.100.3	Description	1315
	1.100.4	Restrictions	1316
	1.100.5	Related commands	1316
	1.100.6	Default	1316
1.101		tad command	1316
	1.101.1	Syntax	1316
	1.101.2	Examples	1317
	1.101.3	Description	1317
	1.101.4	Restrictions	1319
	1.101.5	Related commands	1319
	1.101.6	Default	1320
1.102		temper command	1320
	1.102.1	Syntax	1320
	1.102.2	Examples	1320
	1.102.3	Description	1320
	1.102.4	Restrictions	1322
	1.102.5	Related commands	1322
	1.102.6	Default	1322
1.103		temper/grem command	1322
	1.103.1	Syntax	1322
	1.103.2	Examples	1322
	1.103.3	Description	1322
	1.103.4	Restrictions	1323
	1.103.5	Related commands	1323
	1.103.6	Default	1323
1.104		temper/npt command	1324
	1.104.1	Syntax	1324
	1.104.2	Examples	1324
	1.104.3	Description	1324
	1.104.4	Restrictions	1324
	1.104.5	Related commands	1324
	1.104.6	Default	1324
1.105		thermo command	1325
	1.105.1	Syntax	1325
	1.105.2	Examples	1325
	1.105.3	Description	1325

1.105.4	Restrictions	1325
1.105.5	Related commands	1325
1.105.6	Default	1325
1.106	thermo_modify command	1325
1.106.1	Syntax	1325
1.106.2	Examples	1326
1.106.3	Description	1326
1.106.4	Restrictions	1329
1.106.5	Related commands	1329
1.106.6	Default	1329
1.107	thermo_style command	1329
1.107.1	Syntax	1329
1.107.2	Examples	1331
1.107.3	Description	1331
1.107.4	Restrictions	1336
1.107.5	Related commands	1336
1.107.6	Default	1336
1.108	third_order command	1336
1.108.1	Syntax	1336
1.108.2	Examples	1336
1.108.3	Description	1336
1.108.4	Restrictions	1337
1.108.5	Related commands	1337
1.108.6	Default	1337
1.109	timer command	1337
1.109.1	Syntax	1337
1.109.2	Examples	1337
1.109.3	Description	1338
1.109.4	Restrictions	1339
1.109.5	Related commands	1339
1.109.6	Default	1339
1.110	timestep command	1339
1.110.1	Syntax	1339
1.110.2	Examples	1339
1.110.3	Description	1339
1.110.4	Restrictions	1339
1.110.5	Related commands	1340
1.110.6	Default	1340
1.111	uncompute command	1340
1.111.1	Syntax	1340
1.111.2	Examples	1340
1.111.3	Description	1340
1.111.4	Restrictions	1340
1.111.5	Related commands	1340
1.111.6	Default	1340
1.112	undump command	1341
1.112.1	Syntax	1341
1.112.2	Examples	1341
1.112.3	Description	1341
1.112.4	Restrictions	1341
1.112.5	Related commands	1341
1.112.6	Default	1341
1.113	unfix command	1341
1.113.1	Syntax	1341

1.113.2	Examples	1341
1.113.3	Description	1341
1.113.4	Restrictions	1341
1.113.5	Related commands	1342
1.113.6	Default	1342
1.114	units command	1342
1.114.1	Syntax	1342
1.114.2	Examples	1342
1.114.3	Description	1342
1.114.4	Restrictions	1346
1.114.5	Related commands	1346
1.114.6	Default	1346
1.115	variable command	1346
1.115.1	Syntax	1346
1.115.2	Examples	1348
1.115.3	Description	1349
1.115.4	Immediate Evaluation of Variables	1367
1.115.5	Variable Accuracy	1368
1.115.6	Restrictions	1369
1.115.7	Related commands	1369
1.115.8	Default	1369
1.116	velocity command	1369
1.116.1	Syntax	1369
1.116.2	Examples	1370
1.116.3	Description	1370
1.116.4	Restrictions	1372
1.116.5	Related commands	1372
1.116.6	Default	1373
1.117	write_coeff command	1373
1.117.1	Syntax	1373
1.117.2	Examples	1373
1.117.3	Description	1373
1.117.4	Restrictions	1373
1.117.5	Related commands	1373
1.118	write_data command	1373
1.118.1	Syntax	1373
1.118.2	Examples	1374
1.118.3	Description	1374
1.118.4	Restrictions	1376
1.118.5	Related commands	1376
1.118.6	Default	1376
1.119	write_dump command	1376
1.119.1	Syntax	1376
1.119.2	Examples	1376
1.119.3	Description	1377
1.119.4	Restrictions	1377
1.119.5	Related commands	1377
1.119.6	Default	1378
1.120	write_molecule command	1378
1.120.1	Syntax	1378
1.120.2	Examples	1378
1.120.3	Description	1378
1.120.4	Output Format	1378
1.120.5	Restrictions	1380

1.120.6	Related commands	1380
1.120.7	Defaults	1380
1.121	write_restart command	1381
1.121.1	Syntax	1381
1.121.2	Examples	1381
1.121.3	Description	1381
1.121.4	Restrictions	1382
1.121.5	Related commands	1382
1.121.6	Default	1382
2	Fix Styles	1383
2.1	fix accelerate/cos command	1383
2.1.1	Syntax	1383
2.1.2	Examples	1383
2.1.3	Description	1383
2.1.4	Restart, fix_modify, output, run start/stop, minimize info	1384
2.1.5	Restrictions	1384
2.1.6	Related commands	1384
2.1.7	Default	1384
2.2	fix acks2/reaxff command	1384
2.2.1	Syntax	1384
2.2.2	Examples	1385
2.2.3	Description	1385
2.2.4	Restart, fix_modify, output, run start/stop, minimize info	1385
2.2.5	Restrictions	1386
2.2.6	Related commands	1386
2.2.7	Default	1386
2.3	fix adapt command	1386
2.3.1	Syntax	1386
2.3.2	Examples	1387
2.3.3	Description	1388
2.3.4	Restart, fix_modify, output, run start/stop, minimize info	1394
2.3.5	Restrictions	1394
2.3.6	Related commands	1394
2.3.7	Default	1394
2.4	fix adapt/fep command	1394
2.4.1	Syntax	1394
2.4.2	Examples	1395
2.4.3	Description	1395
2.4.4	Restart, fix_modify, output, run start/stop, minimize info	1398
2.4.5	Restrictions	1398
2.4.6	Related commands	1398
2.4.7	Default	1398
2.5	fix add/heat command	1398
2.5.1	Syntax	1398
2.5.2	Examples	1399
2.5.3	Description	1399
2.5.4	Restart, fix_modify, output, run start/stop, minimize info	1399
2.5.5	Restrictions	1399
2.5.6	Related commands	1400
2.5.7	Default	1400
2.6	fix addforce command	1400
2.6.1	Syntax	1400
2.6.2	Examples	1400

2.6.3	Description	1400
2.6.4	Restart, fix_modify, output, run start/stop, minimize info	1402
2.6.5	Restrictions	1402
2.6.6	Related commands	1402
2.6.7	Default	1402
2.7	fix addtorque/atom command	1402
2.7.1	Syntax	1402
2.7.2	Examples	1403
2.7.3	Description	1403
2.7.4	Restart, fix_modify, output, run start/stop, minimize info	1403
2.7.5	Restrictions	1404
2.7.6	Related commands	1404
2.7.7	Default	1404
2.8	fix addtorque/group command	1404
2.8.1	Syntax	1404
2.8.2	Examples	1404
2.8.3	Description	1404
2.8.4	Restart, fix_modify, output, run start/stop, minimize info	1405
2.8.5	Restrictions	1405
2.8.6	Related commands	1406
2.8.7	Default	1406
2.9	fix alchemy command	1406
2.9.1	Syntax	1406
2.9.2	Examples	1406
2.9.3	Description	1406
2.9.4	Restart, fix_modify, output, run start/stop, minimize info	1407
2.9.5	Restrictions	1408
2.9.6	Related commands	1408
2.9.7	Default	1408
2.10	fix align/self command	1408
2.10.1	Syntax	1408
2.10.2	Examples	1408
2.10.3	Description	1408
2.10.4	Restart, fix_modify, output, run start/stop, minimize info	1409
2.10.5	Restrictions	1409
2.10.6	Related commands	1409
2.10.7	Default	1409
2.11	fix amoeba/bitorsion command	1410
2.11.1	Syntax	1410
2.11.2	Examples	1410
2.11.3	Description	1410
2.11.4	Restart, fix_modify, output, run start/stop, minimize info	1411
2.11.5	Restrictions	1411
2.11.6	Related commands	1411
2.11.7	Default	1412
2.12	fix amoeba/pitorsion command	1412
2.12.1	Syntax	1412
2.12.2	Examples	1412
2.12.3	Description	1412
2.12.4	Restart, fix_modify, output, run start/stop, minimize info	1413
2.12.5	Restrictions	1414
2.12.6	Related commands	1414
2.12.7	Default	1414
2.13	fix append/atoms command	1414

2.13.1	Syntax	1414
2.13.2	Examples	1415
2.13.3	Description	1415
2.13.4	Restart, fix_modify, output, run start/stop, minimize info	1415
2.13.5	Restrictions	1415
2.13.6	Related commands	1415
2.13.7	Default	1415
2.14	fix atc command	1416
2.15	fix atom/swap command	1416
2.15.1	Syntax	1416
2.15.2	Examples	1416
2.15.3	Description	1416
2.15.4	Dump image info	1418
2.15.5	Restart, fix_modify, output, run start/stop, minimize info	1418
2.15.6	Restrictions	1419
2.15.7	Related commands	1419
2.15.8	Default	1419
2.16	fix atom_weight/apip command	1419
2.16.1	Syntax	1419
2.16.2	Examples	1419
2.16.3	Description	1420
2.16.4	Restart, fix_modify, output, run start/stop, minimize info	1420
2.16.5	Restrictions	1421
2.16.6	Related commands	1421
2.16.7	Default	1421
2.17	fix ave/atom command	1421
2.17.1	Syntax	1421
2.17.2	Examples	1421
2.17.3	Description	1422
2.17.4	Restart, fix_modify, output, run start/stop, minimize info	1423
2.17.5	Restrictions	1423
2.17.6	Related commands	1423
2.17.7	Default	1423
2.18	fix ave/chunk command	1423
2.18.1	Syntax	1423
2.18.2	Examples	1425
2.18.3	Description	1425
2.18.4	Restart, fix_modify, output, run start/stop, minimize info	1430
2.18.5	Restrictions	1430
2.18.6	Related commands	1430
2.18.7	Default	1430
2.19	fix ave/correlate command	1430
2.19.1	Syntax	1430
2.19.2	Examples	1431
2.19.3	Description	1431
2.19.4	Restart, fix_modify, output, run start/stop, minimize info	1434
2.19.5	Restrictions	1435
2.19.6	Related commands	1435
2.19.7	Default	1435
2.20	fix ave/correlate/long command	1435
2.20.1	Syntax	1435
2.20.2	Examples	1436
2.20.3	Description	1436
2.20.4	Restart, fix_modify, output, run start/stop, minimize info	1437

	2.20.5	Restrictions	1437
	2.20.6	Related commands	1437
	2.20.7	Default	1437
2.21		fix ave/grid command	1438
	2.21.1	Syntax	1438
	2.21.2	Examples	1439
	2.21.3	Description	1439
	2.21.4	Restart, fix_modify, output, run start/stop, minimize info	1443
	2.21.5	Restrictions	1444
	2.21.6	Related commands	1444
	2.21.7	Default	1444
2.22		fix ave/histo command	1444
2.23		fix ave/histo/weight command	1444
	2.23.1	Syntax	1444
	2.23.2	Examples	1445
	2.23.3	Description	1445
	2.23.4	Restart, fix_modify, output, run start/stop, minimize info	1448
	2.23.5	Restrictions	1449
	2.23.6	Related commands	1449
	2.23.7	Default	1449
2.24		fix ave/moments command	1449
	2.24.1	Syntax	1449
	2.24.2	Examples	1450
	2.24.3	Description	1450
	2.24.4	Restart, fix_modify, output, run start/stop, minimize info	1452
	2.24.5	Restrictions	1452
	2.24.6	Related commands	1452
	2.24.7	Default	1453
2.25		fix ave/spatial command	1453
2.26		fix ave/spatial/sphere command	1453
2.27		fix ave/time command	1453
	2.27.1	Syntax	1453
	2.27.2	Examples	1454
	2.27.3	Description	1454
	2.27.4	Restart, fix_modify, output, run start/stop, minimize info	1457
	2.27.5	Restrictions	1458
	2.27.6	Related commands	1458
	2.27.7	Default	1458
2.28		fix aveforce command	1458
	2.28.1	Syntax	1458
	2.28.2	Examples	1458
	2.28.3	Description	1458
	2.28.4	Restart, fix_modify, output, run start/stop, minimize info	1459
	2.28.5	Restrictions	1459
	2.28.6	Related commands	1459
	2.28.7	Default	1459
2.29		fix balance command	1460
	2.29.1	Syntax	1460
	2.29.2	Examples	1460
	2.29.3	Description	1461
	2.29.4	Restart, fix_modify, output, run start/stop, minimize info	1465
	2.29.5	Restrictions	1465
	2.29.6	Related commands	1465
	2.29.7	Default	1465

2.30	fix baoab command	1465
2.30.1	Syntax	1465
2.30.2	Examples	1466
2.30.3	Description	1466
2.30.4	Restart, fix_modify, output, run start/stop, minimize info	1467
2.30.5	Restrictions	1467
2.30.6	Related commands	1467
2.30.7	Default	1467
2.31	fix bocs command	1467
2.31.1	Syntax	1467
2.31.2	Examples	1468
2.31.3	Description	1468
2.31.4	Restart, fix_modify, output, run start/stop, minimize info	1469
2.31.5	Restrictions	1469
2.31.6	Further information	1469
2.32	fix bond/break command	1469
2.32.1	Syntax	1469
2.32.2	Examples	1470
2.32.3	Description	1470
2.32.4	Dump image info	1471
2.32.5	Restart, fix_modify, output, run start/stop, minimize info	1471
2.32.6	Restrictions	1471
2.32.7	Related commands	1472
2.32.8	Default	1472
2.33	fix bond/create command	1472
2.34	fix bond/create/angle command	1472
2.34.1	Syntax	1472
2.34.2	Examples	1473
2.34.3	Description	1473
2.34.4	Dump image info	1475
2.34.5	Restart, fix_modify, output, run start/stop, minimize info	1475
2.34.6	Restrictions	1476
2.34.7	Related commands	1476
2.34.8	Default	1476
2.35	fix bond/react command	1476
2.35.1	Syntax	1476
2.35.2	Examples	1478
2.35.3	Description	1478
2.35.4	Dump image info	1487
2.35.5	Restart, fix_modify, output, run start/stop, minimize info	1488
2.35.6	Restrictions	1489
2.35.7	Related commands	1489
2.35.8	Default	1489
2.36	fix bond/swap command	1489
2.36.1	Syntax	1489
2.36.2	Examples	1489
2.36.3	Description	1489
2.36.4	Restart, fix_modify, output, run start/stop, minimize info	1492
2.36.5	Restrictions	1492
2.36.6	Related commands	1492
2.36.7	Default	1492
2.37	fix box/relax command	1492
2.37.1	Syntax	1492
2.37.2	Examples	1493

2.37.3	Description	1493
2.37.4	Restart, <i>fix_modify</i> , output, run start/stop, minimize info	1496
2.37.5	Restrictions	1497
2.37.6	Related commands	1497
2.37.7	Default	1497
2.38	<i>fix brownian</i> command	1497
2.39	<i>fix brownian/sphere</i> command	1497
2.40	<i>fix brownian/asphere</i> command	1497
2.40.1	Syntax	1497
2.40.2	Examples	1498
2.40.3	Description	1498
2.40.4	Restart, <i>fix_modify</i> , output, run start/stop, minimize info	1500
2.40.5	Restrictions	1500
2.40.6	Related commands	1501
2.40.7	Default	1501
2.41	<i>fix charge/regulation</i> command	1501
2.41.1	Syntax	1501
2.41.2	Examples	1502
2.41.3	Description	1502
2.41.4	Output	1504
2.41.5	Restrictions	1504
2.41.6	Related commands	1504
2.41.7	Default	1505
2.42	<i>fix cmap</i> command	1505
2.42.1	Syntax	1505
2.42.2	Examples	1505
2.42.3	Description	1505
2.42.4	Restart, <i>fix_modify</i> , output, run start/stop, minimize info	1506
2.42.5	Restrictions	1507
2.42.6	Related commands	1507
2.42.7	Default	1507
2.43	<i>fix colvars</i> command	1507
2.43.1	Syntax	1507
2.43.2	Examples	1508
2.43.3	Description	1508
2.43.4	Restarting	1509
2.43.5	Output	1509
2.43.6	Controlling Colvars via <i>fix_modify</i>	1509
2.43.7	Restrictions	1510
2.43.8	Related commands	1510
2.44	<i>fix controller</i> command	1510
2.44.1	Syntax	1510
2.44.2	Examples	1511
2.44.3	Description	1511
2.44.4	Restart, <i>fix_modify</i> , output, run start/stop, minimize info	1513
2.44.5	Restrictions	1513
2.44.6	Related commands	1513
2.44.7	Default	1513
2.45	<i>fix damping/cundall</i> command	1513
2.45.1	Syntax	1513
2.45.2	Examples	1514
2.45.3	Description	1514
2.45.4	Restart, <i>fix_modify</i> , output, run start/stop, minimize info	1515
2.45.5	Restrictions	1515

	2.45.6	Related commands	1515
	2.45.7	Default	1515
	2.45.8	References	1515
2.46		fix deform command	1515
	2.46.1	Syntax	1515
	2.46.2	Examples	1517
	2.46.3	Description	1517
	2.46.4	Restart, fix_modify, output, run start/stop, minimize info	1523
	2.46.5	Restrictions	1524
	2.46.6	Related commands	1524
	2.46.7	Default	1524
2.47		fix deform/pressure command	1524
	2.47.1	Syntax	1524
	2.47.2	Examples	1526
	2.47.3	Description	1526
	2.47.4	Restart, fix_modify, output, run start/stop, minimize info	1528
	2.47.5	Restrictions	1529
	2.47.6	Related commands	1529
	2.47.7	Default	1529
2.48		fix deposit command	1529
	2.48.1	Syntax	1529
	2.48.2	Examples	1530
	2.48.3	Description	1530
	2.48.4	Restart, fix_modify, output, run start/stop, minimize info	1533
	2.48.5	Restrictions	1533
	2.48.6	Related commands	1533
	2.48.7	Default	1534
2.49		fix dpd/energy command	1534
	2.49.1	Syntax	1534
	2.49.2	Examples	1534
	2.49.3	Description	1534
	2.49.4	Restrictions	1535
	2.49.5	Related commands	1535
	2.49.6	Default	1535
2.50		fix edpd/source command	1535
2.51		fix tdpd/source command	1535
	2.51.1	Syntax	1535
	2.51.2	Examples	1536
	2.51.3	Description	1536
	2.51.4	Restart, fix_modify, output, run start/stop, minimize info	1536
	2.51.5	Restrictions	1536
	2.51.6	Related commands	1536
	2.51.7	Default	1536
2.52		fix drag command	1537
	2.52.1	Syntax	1537
	2.52.2	Examples	1537
	2.52.3	Description	1537
	2.52.4	Restart, fix_modify, output, run start/stop, minimize info	1537
	2.52.5	Restrictions	1538
	2.52.6	Related commands	1538
	2.52.7	Default	1538
2.53		fix drude command	1538
	2.53.1	Syntax	1538
	2.53.2	Examples	1538

2.53.3	Description	1538
2.53.4	Restrictions	1538
2.53.5	Related commands	1538
2.53.6	Default	1539
2.54	fix drude/transform/direct command	1539
2.55	fix drude/transform/inverse command	1539
2.55.1	Syntax	1539
2.55.2	Examples	1539
2.55.3	Description	1539
2.55.4	Restart, fix_modify, output, run start/stop, minimize info	1541
2.55.5	Restrictions	1541
2.55.6	Related commands	1541
2.55.7	Default	1541
2.56	fix dt/reset command	1541
2.56.1	Syntax	1541
2.56.2	Examples	1542
2.56.3	Description	1542
2.56.4	Restart, fix_modify, output, run start/stop, minimize info	1543
2.56.5	Restrictions	1543
2.56.6	Related commands	1543
2.56.7	Default	1543
2.57	fix efield command	1543
2.58	fix efield/tip4p command	1543
2.58.1	Syntax	1543
2.58.2	Examples	1544
2.58.3	Description	1544
2.58.4	Restart, fix_modify, output, run start/stop, minimize info	1545
2.58.5	Restrictions	1546
2.58.6	Related commands	1546
2.58.7	Default	1546
2.59	fix efield/lepton command	1546
2.59.1	Syntax	1546
2.59.2	Examples	1547
2.59.3	Description	1547
2.59.4	Lepton expression syntax and features	1547
2.59.5	Restart, fix_modify, output, run start/stop, minimize info	1549
2.59.6	Restrictions	1549
2.59.7	Related commands	1549
2.59.8	Default	1549
2.60	fix ehex command	1549
2.60.1	Syntax	1549
2.60.2	Examples	1550
2.60.3	Description	1550
2.60.4	Restart, fix_modify, output, run start/stop, minimize info	1552
2.60.5	Restrictions	1552
2.60.6	Related commands	1552
2.60.7	Default	1552
2.61	fix electrode/conp command	1552
2.62	fix electrode/conq command	1552
2.63	fix electrode/thermo command	1552
2.63.1	Syntax	1552
2.63.2	Examples	1553
2.63.3	Description	1553
2.63.4	Restart, fix_modify, output, run start/stop, minimize info	1556

	2.63.5	Restrictions	1557
	2.63.6	Default	1557
2.64		fix electron/stopping command	1558
2.65		fix electron/stopping/fit command	1558
	2.65.1	Syntax	1558
	2.65.2	Examples	1558
	2.65.3	Description	1558
	2.65.4	Restart, fix_modify, output, run start/stop, minimize info	1560
	2.65.5	Restrictions	1560
	2.65.6	Default	1561
2.66		fix enforce2d command	1561
	2.66.1	Syntax	1561
	2.66.2	Examples	1561
	2.66.3	Description	1561
	2.66.4	Restart, fix_modify, output, run start/stop, minimize info	1562
	2.66.5	Restrictions	1562
	2.66.6	Related commands	1562
	2.66.7	Default	1562
2.67		fix eos/cv command	1562
	2.67.1	Syntax	1562
	2.67.2	Examples	1562
	2.67.3	Description	1562
	2.67.4	Restrictions	1562
	2.67.5	Related commands	1563
	2.67.6	Default	1563
2.68		fix eos/table command	1563
	2.68.1	Syntax	1563
	2.68.2	Examples	1563
	2.68.3	Description	1563
	2.68.4	Restrictions	1564
	2.68.5	Related commands	1564
	2.68.6	Default	1564
2.69		fix eos/table/rx command	1564
	2.69.1	Syntax	1565
	2.69.2	Examples	1565
	2.69.3	Description	1565
	2.69.4	Restrictions	1567
	2.69.5	Related commands	1567
	2.69.6	Default	1567
2.70		fix evaporate command	1567
	2.70.1	Syntax	1567
	2.70.2	Examples	1568
	2.70.3	Description	1568
	2.70.4	Restart, fix_modify, output, run start/stop, minimize info	1568
	2.70.5	Restrictions	1569
	2.70.6	Related commands	1569
	2.70.7	Default	1569
2.71		fix external command	1569
	2.71.1	Syntax	1569
	2.71.2	Examples	1569
	2.71.3	Description	1569
	2.71.4	Restart, fix_modify, output, run start/stop, minimize info	1571
	2.71.5	Restrictions	1571
	2.71.6	Related commands	1572

	2.71.7	Default	1572
2.72		fix ffl command	1572
	2.72.1	Syntax	1572
	2.72.2	Examples	1572
	2.72.3	Description	1572
	2.72.4	Restart, fix_modify, output, run start/stop, minimize info	1573
	2.72.5	Restrictions	1573
	2.72.6	Related commands	1573
2.73		fix filter/corotate command	1573
	2.73.1	Syntax	1573
	2.73.2	Examples	1574
	2.73.3	Description	1574
	2.73.4	Restart, fix_modify, output, run start/stop, minimize info	1574
	2.73.5	Restrictions	1574
	2.73.6	Related commands	1574
	2.73.7	Default	1574
2.74		fix flow/gauss command	1574
	2.74.1	Syntax	1574
	2.74.2	Examples	1575
	2.74.3	Description	1575
	2.74.4	Restart, fix_modify, output, run start/stop, minimize info	1576
	2.74.5	Restrictions	1576
	2.74.6	Related commands	1576
	2.74.7	Default	1576
2.75		fix freeze command	1577
	2.75.1	Syntax	1577
	2.75.2	Examples	1577
	2.75.3	Description	1577
	2.75.4	Restart, fix_modify, output, run start/stop, minimize info	1577
	2.75.5	Restrictions	1578
	2.75.6	Related commands	1578
	2.75.7	Default	1578
2.76		fix gcmc command	1578
	2.76.1	Syntax	1578
	2.76.2	Examples	1579
	2.76.3	Description	1579
	2.76.4	Restart, fix_modify, output, run start/stop, minimize info	1583
	2.76.5	Restrictions	1584
	2.76.6	Related commands	1584
	2.76.7	Defaults	1584
2.77		fix gemc command	1584
	2.77.1	Syntax	1584
	2.77.2	Examples	1585
	2.77.3	Description	1585
	2.77.4	Restart, fix_modify, output, run start/stop, minimize info	1586
	2.77.5	Restrictions	1587
	2.77.6	Related commands	1587
	2.77.7	Defaults	1587
2.78		fix gif command	1587
	2.78.1	Syntax	1587
	2.78.2	Examples	1587
	2.78.3	Description	1588
	2.78.4	Restart, fix_modify, output, run start/stop, minimize info	1589
	2.78.5	Restrictions	1589

	2.78.6	Related commands	1589
	2.78.7	Default	1589
2.79		fix gld command	1589
	2.79.1	Syntax	1589
	2.79.2	Examples	1590
	2.79.3	Description	1590
	2.79.4	Restart, fix_modify, output, run start/stop, minimize info	1592
	2.79.5	Restrictions	1592
	2.79.6	Related commands	1592
	2.79.7	Default	1592
2.80		fix gle command	1592
	2.80.1	Syntax	1592
	2.80.2	Examples	1593
	2.80.3	Description	1593
	2.80.4	Restart, fix_modify, output, run start/stop, minimize info	1593
	2.80.5	Restrictions	1594
	2.80.6	Related commands	1594
2.81		fix graphics/arrows command	1594
	2.81.1	Syntax	1594
	2.81.2	Examples	1595
	2.81.3	Description	1595
	2.81.4	Dump image info	1596
	2.81.5	Restart, fix_modify, output, run start/stop, minimize info	1596
	2.81.6	Restrictions	1597
	2.81.7	Related commands	1597
	2.81.8	Default	1597
2.82		fix graphics/chunk command	1597
	2.82.1	Syntax	1597
	2.82.2	Examples	1597
	2.82.3	Description	1598
	2.82.4	Usage example	1599
	2.82.5	Dump image info	1600
	2.82.6	Restart, fix_modify, output, run start/stop, minimize info	1600
	2.82.7	Restrictions	1600
	2.82.8	Related commands	1600
	2.82.9	Defaults	1600
2.83		fix graphics/isosurface command	1601
	2.83.1	Syntax	1601
	2.83.2	Examples	1601
	2.83.3	Description	1601
	2.83.4	Dump image info	1602
	2.83.5	Example for using STL output in VMD	1603
	2.83.6	Restart, fix_modify, output, run start/stop, minimize info	1604
	2.83.7	Restrictions	1604
	2.83.8	Related commands	1604
	2.83.9	Defaults	1604
2.84		fix graphics/labels command	1604
	2.84.1	Syntax	1604
	2.84.2	Examples	1606
	2.84.3	Description	1607
	2.84.4	Dump image info	1609
	2.84.5	Including a “dynamic” image	1610
	2.84.6	Restart, fix_modify, output, run start/stop, minimize info	1612
	2.84.7	Restrictions	1612

	2.84.8	Related commands	1612
	2.84.9	Default	1612
2.85		fix graphics/lines command	1612
	2.85.1	Syntax	1612
	2.85.2	Examples	1612
	2.85.3	Description	1612
	2.85.4	Dump image info	1613
	2.85.5	Restart, fix_modify, output, run start/stop, minimize info	1614
	2.85.6	Restrictions	1614
	2.85.7	Related commands	1614
	2.85.8	Defaults	1614
2.86		fix graphics/objects command	1614
	2.86.1	Syntax	1614
	2.86.2	Examples	1615
	2.86.3	Description	1615
	2.86.4	Dump image info	1616
	2.86.5	Restart, fix_modify, output, run start/stop, minimize info	1618
	2.86.6	Restrictions	1618
	2.86.7	Related commands	1618
	2.86.8	Default	1618
2.87		fix graphics/periodic command	1618
	2.87.1	Syntax	1618
	2.87.2	Examples	1618
	2.87.3	Description	1618
	2.87.4	Dump image info	1619
	2.87.5	Restart, fix_modify, output, run start/stop, minimize info	1619
	2.87.6	Restrictions	1619
	2.87.7	Related commands	1619
	2.87.8	Default	1619
2.88		fix graphics/replica command	1620
	2.88.1	Syntax	1620
	2.88.2	Examples	1620
	2.88.3	Description	1620
	2.88.4	Dump image info	1620
	2.88.5	Usage example	1621
	2.88.6	Restart, fix_modify, output, run start/stop, minimize info	1622
	2.88.7	Restrictions	1622
	2.88.8	Related commands	1622
	2.88.9	Default	1622
2.89		fix gravity command	1622
	2.89.1	Syntax	1622
	2.89.2	Examples	1623
	2.89.3	Description	1623
	2.89.4	Restart, fix_modify, output, run start/stop, minimize info	1624
	2.89.5	Restrictions	1624
	2.89.6	Related commands	1624
	2.89.7	Default	1624
2.90		fix grem command	1624
	2.90.1	Syntax	1624
	2.90.2	Examples	1625
	2.90.3	Description	1625
	2.90.4	Restart, fix_modify, output, run start/stop, minimize info	1625
	2.90.5	Restrictions	1625
	2.90.6	Related commands	1626

	2.90.7	Default	1626
2.91		fix halt command	1626
	2.91.1	Syntax	1626
	2.91.2	Examples	1626
	2.91.3	Description	1626
	2.91.4	Restart, fix_modify, output, run start/stop, minimize info	1629
	2.91.5	Restrictions	1629
	2.91.6	Related commands	1629
	2.91.7	Default	1629
2.92		fix heat command	1629
	2.92.1	Syntax	1629
	2.92.2	Examples	1629
	2.92.3	Description	1629
	2.92.4	Restart, fix_modify, output, run start/stop, minimize info	1630
	2.92.5	Restrictions	1631
	2.92.6	Related commands	1631
	2.92.7	Default	1631
2.93		fix heat/flow command	1631
	2.93.1	Syntax	1631
	2.93.2	Examples	1631
	2.93.3	Description	1631
	2.93.4	Restart, fix_modify, output, run start/stop, minimize info	1631
	2.93.5	Restrictions	1632
	2.93.6	Related commands	1632
	2.93.7	Default	1632
2.94		fix hmc command	1632
	2.94.1	Syntax	1632
	2.94.2	Examples	1632
	2.94.3	Description	1632
	2.94.4	Restart, fix_modify, output, run start/stop, minimize info	1634
	2.94.5	Restrictions	1635
	2.94.6	Related commands	1635
	2.94.7	Default	1635
2.95		fix hyper/global command	1635
	2.95.1	Syntax	1635
	2.95.2	Examples	1635
	2.95.3	Description	1635
	2.95.4	Restart, fix_modify, output, run start/stop, minimize info	1637
	2.95.5	Restrictions	1638
	2.95.6	Related commands	1638
	2.95.7	Default	1638
2.96		fix hyper/local command	1639
	2.96.1	Syntax	1639
	2.96.2	Examples	1639
	2.96.3	Description	1639
	2.96.4	Restart, fix_modify, output, run start/stop, minimize info	1643
	2.96.5	Restrictions	1645
	2.96.6	Related commands	1645
	2.96.7	Default	1645
2.97		fix ilves command	1646
	2.97.1	Syntax	1646
	2.97.2	Examples	1646
	2.97.3	Description	1646
	2.97.4	Restart, fix_modify, output, run start/stop, minimize info	1649

	2.97.5	Restrictions	1649
	2.97.6	Related commands	1650
	2.97.7	Default	1650
2.98		fix imd command	1650
	2.98.1	Syntax	1650
	2.98.2	Examples	1651
	2.98.3	Description	1651
	2.98.4	Restart, fix_modify, output, run start/stop, minimize info	1652
	2.98.5	Restrictions	1652
	2.98.6	Related commands	1652
	2.98.7	Default	1652
2.99		fix indent command	1653
	2.99.1	Syntax	1653
	2.99.2	Examples	1653
	2.99.3	Description	1654
	2.99.4	Dump image info	1655
	2.99.5	Restart, fix_modify, output, run start/stop, minimize info	1656
	2.99.6	Restrictions	1656
	2.99.7	Related commands	1656
	2.99.8	Default	1656
2.100		fix ipi command	1656
	2.100.1	Syntax	1656
	2.100.2	Examples	1657
	2.100.3	Description	1657
	2.100.4	Obtaining i-PI	1657
	2.100.5	Restart, fix_modify, output, run start/stop, minimize info	1657
	2.100.6	Restrictions	1657
	2.100.7	Related commands	1658
2.101		fix lambda/apip command	1658
	2.101.1	Syntax	1658
	2.101.2	Examples	1659
	2.101.3	Description	1659
	2.101.4	Restart, fix_modify, output, run start/stop, minimize info	1661
	2.101.5	Restrictions	1661
	2.101.6	Related commands	1661
	2.101.7	Default	1661
2.102		fix lambda/la/csp/apip command	1661
	2.102.1	Syntax	1661
	2.102.2	Examples	1662
	2.102.3	Description	1662
	2.102.4	Restart, fix_modify, output, run start/stop, minimize info	1663
	2.102.5	Restrictions	1664
	2.102.6	Related commands	1664
	2.102.7	Default	1664
2.103		fix lambda_thermostat/apip command	1664
	2.103.1	Syntax	1664
	2.103.2	Examples	1664
	2.103.3	Description	1664
	2.103.4	Restart, fix_modify, output, run start/stop, minimize info	1665
	2.103.5	Restrictions	1666
	2.103.6	Related commands	1666
	2.103.7	Default	1666
2.104		fix langevin command	1666
	2.104.1	Syntax	1666

2.104.2	Examples	1667
2.104.3	Description	1667
2.104.4	Restart, fix_modify, output, run start/stop, minimize info	1669
2.104.5	Restrictions	1670
2.104.6	Related commands	1670
2.104.7	Default	1670
2.105	fix langevin/drude command	1670
2.105.1	Syntax	1670
2.105.2	Examples	1671
2.105.3	Description	1671
2.105.4	Restart, fix_modify, output, run start/stop, minimize info	1674
2.105.5	Restrictions	1674
2.105.6	Related commands	1674
2.105.7	Default	1674
2.106	fix langevin/eff command	1674
2.106.1	Syntax	1674
2.106.2	Examples	1675
2.106.3	Description	1675
2.106.4	Restart, fix_modify, output, run start/stop, minimize info	1675
2.106.5	Restrictions	1675
2.106.6	Related commands	1676
2.106.7	Default	1676
2.107	fix langevin/spin command	1676
2.107.1	Syntax	1676
2.107.2	Examples	1676
2.107.3	Description	1676
2.107.4	Restart, fix_modify, output, run start/stop, minimize info	1677
2.107.5	Restrictions	1677
2.107.6	Related commands	1677
2.107.7	Default	1677
2.108	fix lb/fluid command	1677
2.108.1	Syntax	1677
2.108.2	Examples	1678
2.108.3	Description	1679
2.108.4	Restart, fix_modify, output, run start/stop, minimize info	1682
2.108.5	Restrictions	1682
2.108.6	Related commands	1682
2.108.7	Default	1683
2.109	fix lb/momentum command	1683
2.109.1	Syntax	1683
2.109.2	Examples	1683
2.109.3	Description	1683
2.109.4	Restart, fix_modify, output, run start/stop, minimize info	1684
2.109.5	Restrictions	1684
2.109.6	Related commands	1684
2.109.7	Default	1684
2.110	fix lb/viscous command	1684
2.110.1	Syntax	1684
2.110.2	Examples	1684
2.110.3	Description	1684
2.110.4	Restart, fix_modify, output, run start/stop, minimize info	1685
2.110.5	Restrictions	1685
2.110.6	Related commands	1685
2.110.7	Default	1685

2.111	fix lineforce command	1685
2.111.1	Syntax	1685
2.111.2	Examples	1685
2.111.3	Description	1685
2.111.4	Restart, fix_modify, output, run start/stop, minimize info	1686
2.111.5	Restrictions	1686
2.111.6	Related commands	1686
2.111.7	Default	1686
2.112	fix manifoldforce command	1686
2.112.1	Syntax	1686
2.112.2	Examples	1686
2.112.3	Description	1687
2.112.4	Restart, fix_modify, output, run start/stop, minimize info	1687
2.112.5	Restrictions	1687
2.112.6	Related commands	1687
2.113	fix mdi/qm command	1687
2.113.1	Syntax	1687
2.113.2	Examples	1688
2.113.3	Description	1688
2.113.4	Restart, fix_modify, output, run start/stop, minimize info	1690
2.113.5	Restrictions	1690
2.113.6	Related commands	1691
2.113.7	Default	1691
2.114	fix mdi/qmmm command	1691
2.114.1	Syntax	1691
2.114.2	Examples	1691
2.114.3	Description	1691
2.114.4	Restart, fix_modify, output, run start/stop, minimize info	1693
2.114.5	Restrictions	1694
2.114.6	Related commands	1694
2.114.7	Default	1694
2.115	fix meso/move command	1694
2.115.1	Syntax	1694
2.115.2	Examples	1695
2.115.3	Description	1695
2.115.4	Restart, fix_modify, output, run start/stop, minimize info	1697
2.115.5	Restrictions	1697
2.115.6	Related commands	1698
2.115.7	Default	1698
2.116	fix mol/swap command	1698
2.116.1	Syntax	1698
2.116.2	Examples	1698
2.116.3	Description	1698
2.116.4	Dump image info	1699
2.116.5	Restart, fix_modify, output, run start/stop, minimize info	1700
2.116.6	Restrictions	1700
2.116.7	Related commands	1700
2.116.8	Default	1700
2.117	fix momentum command	1700
2.118	fix momentum/chunk command	1701
2.118.1	Syntax	1701
2.118.2	Examples	1701
2.118.3	Description	1701
2.118.4	Restart, fix_modify, output, run start/stop, minimize info	1702

2.118.5	Restrictions	1702
2.118.6	Related commands	1702
2.118.7	Default	1702
2.119	fix move command	1702
2.119.1	Syntax	1702
2.119.2	Examples	1703
2.119.3	Description	1703
2.119.4	Restart, fix_modify, output, run start/stop, minimize info	1705
2.119.5	Restrictions	1706
2.119.6	Related commands	1706
2.119.7	Default	1706
2.120	fix msst command	1706
2.120.1	Syntax	1706
2.120.2	Examples	1706
2.120.3	Description	1706
2.120.4	Restart, fix_modify, output, run start/stop, minimize info	1707
2.120.5	Restrictions	1708
2.120.6	Related commands	1708
2.120.7	Default	1708
2.121	fix mvv/dpd command	1709
2.122	fix mvv/edpd command	1709
2.123	fix mvv/tdpd command	1709
2.123.1	Syntax	1709
2.123.2	Examples	1709
2.123.3	Description	1709
2.123.4	Restart, fix_modify, output, run start/stop, minimize info	1710
2.123.5	Restrictions	1710
2.123.6	Related commands	1710
2.123.7	Default	1710
2.124	fix neb command	1710
2.124.1	Syntax	1710
2.124.2	Examples	1711
2.124.3	Description	1711
2.124.4	Restart, fix_modify, output, run start/stop, minimize info	1713
2.124.5	Restrictions	1713
2.124.6	Related commands	1713
2.124.7	Default	1713
2.125	fix neb/spin command	1714
2.125.1	Syntax	1714
2.125.2	Examples	1714
2.125.3	Description	1714
2.125.4	Restart, fix_modify, output, run start/stop, minimize info	1714
2.125.5	Restrictions	1714
2.125.6	Related commands	1714
2.125.7	Default	1714
2.126	fix neighbor/swap command	1715
2.126.1	Syntax	1715
2.126.2	Examples	1715
2.126.3	Description	1715
2.126.4	Dump image info	1717
2.126.5	Restart, fix_modify, output, run start/stop, minimize info	1718
2.126.6	Restrictions	1718
2.126.7	Related commands	1718
2.126.8	Default	1718

2.127	fix nvt command	1718
2.128	fix npt command	1718
2.129	fix nph command	1719
2.129.1	Syntax	1719
2.129.2	Examples	1720
2.129.3	Description	1720
2.129.4	Restart, fix_modify, output, run start/stop, minimize info	1726
2.129.5	Restrictions	1727
2.129.6	Related commands	1727
2.129.7	Default	1727
2.130	fix nvt/eff command	1728
2.131	fix npt/eff command	1728
2.132	fix nph/eff command	1728
2.132.1	Syntax	1728
2.132.2	Examples	1728
2.132.3	Description	1729
2.132.4	Restart, fix_modify, output, run start/stop, minimize info	1729
2.132.5	Restrictions	1729
2.132.6	Related commands	1730
2.132.7	Default	1730
2.133	fix nvt/uef command	1730
2.134	fix npt/uef command	1730
2.134.1	Syntax	1730
2.134.2	Examples	1730
2.134.3	Description	1731
2.134.4	Restart, fix_modify, output, run start/stop, minimize info	1732
2.134.5	Restrictions	1733
2.134.6	Related commands	1733
2.134.7	Default	1733
2.135	fix nonaffine/displacement command	1733
2.135.1	Syntax	1733
2.135.2	Examples	1734
2.135.3	Description	1734
2.135.4	Restart, fix_modify, output, run start/stop, minimize info	1735
2.135.5	Restrictions	1735
2.135.6	Related commands	1735
2.135.7	Default	1735
2.136	fix nph/asphere command	1735
2.136.1	Syntax	1735
2.136.2	Examples	1736
2.136.3	Description	1736
2.136.4	Restart, fix_modify, output, run start/stop, minimize info	1737
2.136.5	Restrictions	1737
2.136.6	Related commands	1737
2.136.7	Default	1737
2.137	fix nph/body command	1737
2.137.1	Syntax	1737
2.137.2	Examples	1737
2.137.3	Description	1738
2.137.4	Restart, fix_modify, output, run start/stop, minimize info	1738
2.137.5	Restrictions	1739
2.137.6	Related commands	1739
2.137.7	Default	1739
2.138	fix nph/sphere command	1739

2.138.1	Syntax	1739
2.138.2	Examples	1739
2.138.3	Description	1739
2.138.4	Restart, fix_modify, output, run start/stop, minimize info	1740
2.138.5	Restrictions	1741
2.138.6	Related commands	1741
2.138.7	Default	1741
2.139	fix np Hug command	1741
2.139.1	Syntax	1741
2.139.2	Examples	1742
2.139.3	Description	1742
2.139.4	Restart, fix_modify, output, run start/stop, minimize info	1743
2.139.5	Restrictions	1744
2.139.6	Related commands	1744
2.139.7	Default	1744
2.140	fix npt/asphere command	1744
2.140.1	Syntax	1744
2.140.2	Examples	1744
2.140.3	Description	1744
2.140.4	Restart, fix_modify, output, run start/stop, minimize info	1745
2.140.5	Restrictions	1746
2.140.6	Related commands	1746
2.140.7	Default	1746
2.141	fix npt/body command	1746
2.141.1	Syntax	1746
2.141.2	Examples	1746
2.141.3	Description	1747
2.141.4	Restart, fix_modify, output, run start/stop, minimize info	1747
2.141.5	Restrictions	1748
2.141.6	Related commands	1748
2.141.7	Default	1748
2.142	fix npt/cauchy command	1748
2.142.1	Syntax	1748
2.142.2	Examples	1749
2.142.3	Description	1749
2.142.4	Restart, fix_modify, output, run start/stop, minimize info	1754
2.142.5	Restrictions	1755
2.142.6	Related commands	1756
2.142.7	Default	1756
2.143	fix npt/sphere command	1756
2.143.1	Syntax	1756
2.143.2	Examples	1756
2.143.3	Description	1756
2.143.4	Restart, fix_modify, output, run start/stop, minimize info	1758
2.143.5	Restrictions	1758
2.143.6	Related commands	1758
2.143.7	Default	1758
2.144	fix numdiff command	1758
2.144.1	Syntax	1758
2.144.2	Examples	1758
2.144.3	Description	1759
2.144.4	Restart, fix_modify, output, run start/stop, minimize info	1759
2.144.5	Restrictions	1760
2.144.6	Related commands	1760

2.144.7	Default	1760
2.145	fix numdiff/virial command	1760
2.145.1	Syntax	1760
2.145.2	Examples	1760
2.145.3	Description	1760
2.145.4	Restart, fix_modify, output, run start/stop, minimize info	1761
2.145.5	Restrictions	1761
2.145.6	Related commands	1761
2.145.7	Default	1761
2.146	fix nve command	1761
2.146.1	Syntax	1761
2.146.2	Examples	1762
2.146.3	Description	1762
2.146.4	Restart, fix_modify, output, run start/stop, minimize info	1762
2.146.5	Restrictions	1762
2.146.6	Related commands	1762
2.146.7	Default	1762
2.147	fix nve/asphere command	1762
2.147.1	Syntax	1763
2.147.2	Examples	1763
2.147.3	Description	1763
2.147.4	Restart, fix_modify, output, run start/stop, minimize info	1763
2.147.5	Restrictions	1763
2.147.6	Related commands	1763
2.147.7	Default	1764
2.148	fix nve/asphere/noforce command	1764
2.148.1	Syntax	1764
2.148.2	Examples	1764
2.148.3	Description	1764
2.148.4	Restart, fix_modify, output, run start/stop, minimize info	1764
2.148.5	Restrictions	1764
2.148.6	Related commands	1764
2.148.7	Default	1764
2.149	fix nve/body command	1765
2.149.1	Syntax	1765
2.149.2	Examples	1765
2.149.3	Description	1765
2.149.4	Restart, fix_modify, output, run start/stop, minimize info	1765
2.149.5	Restrictions	1765
2.149.6	Related commands	1765
2.149.7	Default	1765
2.150	fix nve/bpm/sphere command	1765
2.150.1	Syntax	1765
2.150.2	Examples	1766
2.150.3	Description	1766
2.150.4	Restart, fix_modify, output, run start/stop, minimize info	1766
2.150.5	Restrictions	1766
2.150.6	Related commands	1767
2.150.7	Default	1767
2.151	fix nve/dot command	1767
2.151.1	Syntax	1767
2.151.2	Examples	1767
2.151.3	Description	1767
2.151.4	Restrictions	1767

2.151.5	Related commands	1767
2.151.6	Default	1767
2.152	fix nve/dotc/langevin command	1768
2.152.1	Syntax	1768
2.152.2	Examples	1768
2.152.3	Description	1768
2.152.4	Restrictions	1769
2.152.5	Related commands	1769
2.152.6	Default	1769
2.153	fix nve/eff command	1770
2.153.1	Syntax	1770
2.153.2	Examples	1770
2.153.3	Description	1770
2.153.4	Restart, fix_modify, output, run start/stop, minimize info	1770
2.153.5	Restrictions	1770
2.153.6	Related commands	1770
2.153.7	Default	1770
2.154	fix nve/limit command	1770
2.154.1	Syntax	1771
2.154.2	Examples	1771
2.154.3	Description	1771
2.154.4	Restart, fix_modify, output, run start/stop, minimize info	1771
2.154.5	Restrictions	1772
2.154.6	Related commands	1772
2.154.7	Default	1772
2.155	fix nve/line command	1772
2.155.1	Syntax	1772
2.155.2	Examples	1772
2.155.3	Description	1772
2.155.4	Restart, fix_modify, output, run start/stop, minimize info	1772
2.155.5	Restrictions	1773
2.155.6	Related commands	1773
2.155.7	Default	1773
2.156	fix nve/manifold/rattle command	1773
2.156.1	Syntax	1773
2.156.2	Examples	1773
2.156.3	Description	1773
2.156.4	Restart, fix_modify, output, run start/stop, minimize info	1774
2.156.5	Restrictions	1774
2.156.6	Related commands	1774
2.156.7	Default	1774
2.157	fix nve/noforce command	1774
2.157.1	Syntax	1774
2.157.2	Examples	1774
2.157.3	Description	1775
2.157.4	Restart, fix_modify, output, run start/stop, minimize info	1775
2.157.5	Restrictions	1775
2.157.6	Related commands	1775
2.157.7	Default	1775
2.158	fix nve/sphere command	1775
2.158.1	Syntax	1775
2.158.2	Examples	1776
2.158.3	Description	1776
2.158.4	Restart, fix_modify, output, run start/stop, minimize info	1776

2.158.5	Restrictions	1777
2.158.6	Related commands	1777
2.158.7	Default	1777
2.159	fix nve/spin command	1777
2.159.1	Syntax	1777
2.159.2	Examples	1777
2.159.3	Description	1777
2.159.4	Restrictions	1778
2.159.5	Related commands	1778
2.159.6	Default	1778
2.160	fix nve/tri command	1778
2.160.1	Syntax	1778
2.160.2	Examples	1779
2.160.3	Description	1779
2.160.4	Restart, fix_modify, output, run start/stop, minimize info	1779
2.160.5	Restrictions	1779
2.160.6	Related commands	1779
2.160.7	Default	1779
2.161	fix nvk command	1779
2.161.1	Syntax	1779
2.161.2	Examples	1779
2.161.3	Description	1780
2.161.4	Restart, fix_modify, output, run start/stop, minimize info	1780
2.161.5	Restrictions	1780
2.161.6	Related commands	1780
2.161.7	Default	1780
2.162	fix nvt/asphere command	1780
2.162.1	Syntax	1780
2.162.2	Examples	1781
2.162.3	Description	1781
2.162.4	Restart, fix_modify, output, run start/stop, minimize info	1782
2.162.5	Restrictions	1782
2.162.6	Related commands	1782
2.162.7	Default	1782
2.163	fix nvt/body command	1782
2.163.1	Syntax	1782
2.163.2	Examples	1782
2.163.3	Description	1783
2.163.4	Restart, fix_modify, output, run start/stop, minimize info	1783
2.163.5	Restrictions	1784
2.163.6	Related commands	1784
2.163.7	Default	1784
2.164	fix nvt/manifold/rattle command	1784
2.164.1	Syntax	1784
2.164.2	Examples	1784
2.164.3	Description	1784
2.164.4	Restart, fix_modify, output, run start/stop, minimize info	1785
2.164.5	Restrictions	1785
2.164.6	Related commands	1785
2.165	fix nvt/sllod command	1785
2.165.1	Syntax	1785
2.165.2	Examples	1785
2.165.3	Description	1786
2.165.4	Restart, fix_modify, output, run start/stop, minimize info	1788

2.165.5	Restrictions	1789
2.165.6	Related commands	1789
2.165.7	Default	1789
2.166	fix nvt/sllod/eff command	1789
2.166.1	Syntax	1789
2.166.2	Examples	1789
2.166.3	Description	1790
2.166.4	Restart, fix_modify, output, run start/stop, minimize info	1790
2.166.5	Restrictions	1790
2.166.6	Related commands	1790
2.166.7	Default	1790
2.167	fix nvt/sphere command	1790
2.167.1	Syntax	1791
2.167.2	Examples	1791
2.167.3	Description	1791
2.167.4	Restart, fix_modify, output, run start/stop, minimize info	1792
2.167.5	Restrictions	1792
2.167.6	Related commands	1792
2.167.7	Default	1792
2.168	fix oneway command	1793
2.168.1	Syntax	1793
2.168.2	Examples	1793
2.168.3	Description	1793
2.168.4	Restart, fix_modify, output, run start/stop, minimize info	1793
2.168.5	Restrictions	1794
2.168.6	Related commands	1794
2.168.7	Default	1794
2.169	fix orient/fcc command	1794
2.170	fix orient/bcc command	1794
2.170.1	Syntax	1794
2.170.2	Examples	1794
2.170.3	Description	1794
2.170.4	Restart, fix_modify, output, run start/stop, minimize info	1796
2.170.5	Restrictions	1796
2.170.6	Related commands	1797
2.170.7	Default	1797
2.171	fix orient/eco command	1797
2.171.1	Examples	1797
2.171.2	Description	1798
2.171.3	Restart, fix_modify, output, run start/stop, minimize info	1798
2.171.4	Restrictions	1799
2.171.5	Related commands	1799
2.171.6	Default	1799
2.172	fix pafi command	1800
2.172.1	Syntax	1800
2.172.2	Examples	1800
2.172.3	Description	1800
2.172.4	Restart, fix_modify, output, run start/stop, minimize info	1801
2.172.5	Restrictions	1801
2.172.6	Default	1801
2.173	fix pair command	1801
2.173.1	Syntax	1801
2.173.2	Examples	1801
2.173.3	Description	1802

2.173.4	Restart, fix_modify, output, run start/stop, minimize info	1802
2.173.5	Restrictions	1802
2.173.6	Related commands	1802
2.173.7	Default	1803
2.174	fix phonon command	1803
2.174.1	Syntax	1803
2.174.2	Examples	1803
2.174.3	Description	1803
2.174.4	Restart, fix_modify, output, run start/stop, minimize info	1804
2.174.5	Restrictions	1805
2.174.6	Related commands	1805
2.174.7	Default	1805
2.175	fix pimd/langevin command	1805
2.176	fix pimd/nvt command	1805
2.177	fix pimd/langevin/bosonic command	1805
2.178	fix pimd/nvt/bosonic command	1805
2.178.1	Syntax	1805
2.178.2	Examples	1806
2.178.3	Description	1806
2.178.4	Restart, fix_modify, output, run start/stop, minimize info	1811
2.178.5	Restrictions	1814
2.178.6	Related commands	1814
2.178.7	Default	1814
2.179	fix planeforce command	1815
2.179.1	Syntax	1815
2.179.2	Examples	1815
2.179.3	Description	1815
2.179.4	Restart, fix_modify, output, run start/stop, minimize info	1815
2.179.5	Restrictions	1816
2.179.6	Related commands	1816
2.179.7	Default	1816
2.180	fix plumed command	1816
2.180.1	Syntax	1816
2.180.2	Examples	1816
2.180.3	Description	1816
2.180.4	Restart, fix_modify, output, run start/stop, minimize info	1817
2.180.5	Restrictions	1817
2.180.6	Related commands	1817
2.180.7	Default	1817
2.181	fix poems command	1817
2.182	fix polarize/bem/gmres command	1818
2.183	fix polarize/bem/icc command	1818
2.184	fix polarize/functional command	1818
2.184.1	Syntax	1818
2.184.2	Examples	1818
2.184.3	Description	1818
2.184.4	Restart, fix_modify, output, run start/stop, minimize info	1819
2.184.5	Restrictions	1820
2.184.6	Related commands	1820
2.184.7	Default	1820
2.185	fix pour command	1821
2.185.1	Syntax	1821
2.185.2	Examples	1822
2.185.3	Description	1822

2.185.4	Restart, fix_modify, output, run start/stop, minimize info	1824
2.185.5	Restrictions	1824
2.185.6	Related commands	1824
2.185.7	Default	1824
2.186	fix precession/spin command	1825
2.186.1	Syntax	1825
2.186.2	Examples	1825
2.186.3	Description	1825
2.186.4	Restart, fix_modify, output, run start/stop, minimize info	1827
2.186.5	Restrictions	1827
2.186.6	Related commands	1827
2.186.7	Default	1827
2.187	fix press/berendsen command	1827
2.187.1	Syntax	1827
2.187.2	Examples	1828
2.187.3	Description	1828
2.187.4	Restart, fix_modify, output, run start/stop, minimize info	1830
2.187.5	Restrictions	1830
2.187.6	Related commands	1830
2.187.7	Default	1830
2.188	fix press/langevin command	1830
2.188.1	Syntax	1830
2.188.2	Examples	1831
2.188.3	Description	1831
2.188.4	Restart, fix_modify, output, run start/stop, minimize info	1834
2.188.5	Restrictions	1834
2.188.6	Related commands	1834
2.188.7	Default	1834
2.189	fix print command	1834
2.189.1	Syntax	1834
2.189.2	Examples	1835
2.189.3	Description	1835
2.189.4	Restart, fix_modify, output, run start/stop, minimize info	1836
2.189.5	Restrictions	1836
2.189.6	Related commands	1836
2.189.7	Default	1836
2.190	fix propel/self command	1836
2.190.1	Syntax	1836
2.190.2	Examples	1836
2.190.3	Description	1836
2.190.4	Restart, fix_modify, output, run start/stop, minimize info	1838
2.190.5	Restrictions	1838
2.190.6	Related commands	1838
2.190.7	Default	1838
2.191	fix property/atom command	1838
2.191.1	Syntax	1838
2.191.2	Examples	1839
2.191.3	Description	1839
2.191.4	Restart, fix_modify, output, run start/stop, minimize info	1842
2.191.5	Restrictions	1842
2.191.6	Related commands	1842
2.191.7	Default	1842
2.192	fix python/invoke command	1842
2.192.1	Syntax	1842

2.192.2	Examples	1843
2.192.3	Description	1843
2.192.4	Restart, fix_modify, output, run start/stop, minimize info	1843
2.192.5	Restrictions	1844
2.192.6	Related commands	1844
2.193	fix python/move command	1844
2.193.1	Syntax	1844
2.193.2	Examples	1844
2.193.3	Description	1844
2.193.4	Restart, fix_modify, output, run start/stop, minimize info	1845
2.193.5	Restrictions	1845
2.193.6	Related commands	1845
2.193.7	Default	1845
2.194	fix qbmsst command	1845
2.194.1	Syntax	1845
2.194.2	Examples	1846
2.194.3	Description	1847
2.194.4	Restart, fix_modify, output, run start/stop, minimize info	1848
2.194.5	Restrictions	1849
2.194.6	Related commands	1849
2.194.7	Default	1849
2.195	fix qeq/point command	1849
2.196	fix qeq/shielded command	1849
2.197	fix qeq/slatter command	1849
2.198	fix qeq/ctip command	1849
2.199	fix qeq/dynamic command	1849
2.200	fix qeq/fire command	1850
2.200.1	Syntax	1850
2.200.2	Examples	1850
2.200.3	Description	1851
2.200.4	Restart, fix_modify, output, run start/stop, minimize info	1853
2.200.5	Restrictions	1854
2.200.6	Related commands	1854
2.200.7	Default	1854
2.201	fix qeq/comb command	1854
2.201.1	Syntax	1854
2.201.2	Examples	1855
2.201.3	Description	1855
2.201.4	Restart, fix_modify, output, run start/stop, minimize info	1855
2.201.5	Restrictions	1856
2.201.6	Related commands	1856
2.201.7	Default	1856
2.202	fix qeq/reaxff command	1856
2.202.1	Syntax	1856
2.202.2	Examples	1857
2.202.3	Description	1857
2.202.4	Restart, fix_modify, output, run start/stop, minimize info	1857
2.202.5	Restrictions	1858
2.202.6	Related commands	1858
2.202.7	Default	1858
2.203	fix qeq/rel/reaxff command	1858
2.203.1	Syntax	1858
2.203.2	Examples	1859
2.203.3	Description	1859

2.203.4	Restart, fix_modify, output, run start/stop, minimize info	1860
2.203.5	Restrictions	1860
2.203.6	Related commands	1861
2.203.7	Default	1861
2.204	fix qmmm command	1861
2.204.1	Syntax	1861
2.204.2	Examples	1861
2.204.3	Description	1861
2.204.4	Restart, fix_modify, output, run start/stop, minimize info	1861
2.204.5	Restrictions	1862
2.204.6	Related commands	1862
2.204.7	Default	1862
2.205	fix qtb command	1862
2.205.1	Syntax	1862
2.205.2	Examples	1862
2.205.3	Description	1862
2.205.4	Restart, fix_modify, output, run start/stop, minimize info	1864
2.205.5	Restrictions	1864
2.205.6	Related commands	1864
2.205.7	Default	1864
2.206	fix qtpie/reaxff command	1864
2.206.1	Syntax	1864
2.206.2	Examples	1865
2.206.3	Description	1865
2.206.4	Restart, fix_modify, output, run start/stop, minimize info	1866
2.206.5	Restrictions	1866
2.206.6	Related commands	1866
2.206.7	Default	1866
2.207	fix reaxff/bonds command	1867
2.207.1	Syntax	1867
2.207.2	Examples	1867
2.207.3	Description	1867
2.207.4	Dump image info	1868
2.207.5	Restart, fix_modify, output, run start/stop, minimize info	1868
2.207.6	Restrictions	1869
2.207.7	Related commands	1869
2.207.8	Default	1869
2.208	fix reaxff/species command	1869
2.208.1	Syntax	1869
2.208.2	Examples	1870
2.208.3	Description	1870
2.208.4	Restart, fix_modify, output, run start/stop, minimize info	1872
2.208.5	Restrictions	1873
2.208.6	Related commands	1873
2.208.7	Default	1873
2.209	fix recenter command	1873
2.209.1	Syntax	1873
2.209.2	Examples	1874
2.209.3	Description	1874
2.209.4	Restart, fix_modify, output, run start/stop, minimize info	1875
2.209.5	Restrictions	1875
2.209.6	Related commands	1875
2.209.7	Default	1875
2.210	fix restrain command	1875

2.210.1	Syntax	1875
2.210.2	Examples	1876
2.210.3	Description	1876
2.210.4	Restart, fix_modify, output, run start/stop, minimize info	1878
2.210.5	Restrictions	1879
2.210.6	Related commands	1879
2.210.7	Default	1879
2.211	fix rheo command	1879
2.211.1	Syntax	1879
2.211.2	Examples	1880
2.211.3	Description	1880
2.211.4	Restart, fix_modify, output, run start/stop, minimize info	1881
2.211.5	Restrictions	1882
2.211.6	Related commands	1882
2.211.7	Default	1882
2.212	fix rheo/oxidation command	1882
2.212.1	Syntax	1882
2.212.2	Examples	1882
2.212.3	Description	1882
2.212.4	Restart, fix_modify, output, run start/stop, minimize info	1883
2.212.5	Restrictions	1883
2.212.6	Related commands	1883
2.212.7	Default	1883
2.213	fix rheo/pressure command	1883
2.213.1	Syntax	1883
2.213.2	Examples	1883
2.213.3	Description	1884
2.213.4	Restart, fix_modify, output, run start/stop, minimize info	1884
2.213.5	Restrictions	1884
2.213.6	Related commands	1885
2.213.7	Default	1885
2.214	fix rheo/thermal command	1885
2.214.1	Syntax	1885
2.214.2	Examples	1885
2.214.3	Description	1885
2.214.4	Restart, fix_modify, output, run start/stop, minimize info	1886
2.214.5	Restrictions	1886
2.214.6	Related commands	1886
2.214.7	Default	1886
2.215	fix rheo/viscosity command	1886
2.215.1	Syntax	1886
2.215.2	Examples	1887
2.215.3	Description	1887
2.215.4	Restart, fix_modify, output, run start/stop, minimize info	1887
2.215.5	Restrictions	1887
2.215.6	Related commands	1888
2.215.7	Default	1888
2.216	fix rhok command	1888
2.216.1	Syntax	1888
2.216.2	Examples	1888
2.216.3	Description	1888
2.216.4	Restart, fix_modify, output, run start/stop, minimize info	1888
2.216.5	Restrictions	1889
2.216.6	Related commands	1889

2.216.7	Default	1889
2.217	fix rigid command	1889
2.218	fix rigid/nve command	1889
2.219	fix rigid/nvt command	1889
2.220	fix rigid/npt command	1889
2.221	fix rigid/nph command	1889
2.222	fix rigid/small command	1889
2.223	fix rigid/nve/small command	1890
2.224	fix rigid/nvt/small command	1890
2.225	fix rigid/npt/small command	1890
2.226	fix rigid/nph/small command	1890
2.226.1	Syntax	1890
2.226.2	Examples	1891
2.226.3	Description	1891
2.226.4	Restart, fix_modify, output, run start/stop, minimize info	1899
2.226.5	Restrictions	1900
2.226.6	Related commands	1900
2.226.7	Default	1901
2.227	fix rigid/meso command	1901
2.227.1	Syntax	1901
2.227.2	Examples	1901
2.227.3	Description	1902
2.227.4	Restart, fix_modify, output, run start/stop, minimize info	1904
2.227.5	Restrictions	1905
2.227.6	Related commands	1905
2.227.7	Default	1905
2.228	fix rx command	1905
2.228.1	Syntax	1906
2.228.2	Examples	1906
2.228.3	Description	1906
2.228.4	Restrictions	1908
2.228.5	Related commands	1909
2.228.6	Default	1909
2.229	fix saed/vtk command	1909
2.229.1	Syntax	1909
2.229.2	Examples	1909
2.229.3	Description	1909
2.229.4	Restart, fix_modify, output, run start/stop, minimize info	1911
2.229.5	Restrictions	1911
2.229.6	Related commands	1911
2.229.7	Default	1911
2.230	fix set command	1911
2.230.1	Syntax	1911
2.230.2	Examples	1911
2.230.3	Description	1912
2.230.4	Restart, fix_modify, output, run start/stop, minimize info	1913
2.230.5	Restrictions	1913
2.230.6	Related commands	1914
2.230.7	Default	1914
2.231	fix setforce command	1914
2.232	fix setforce/spin command	1914
2.232.1	Syntax	1914
2.232.2	Examples	1914
2.232.3	Description	1914

2.232.4	Restart, fix_modify, output, run start/stop, minimize info	1915
2.232.5	Restrictions	1916
2.232.6	Related commands	1916
2.232.7	Default	1916
2.233	fix settorque/atom command	1916
2.233.1	Syntax	1916
2.233.2	Examples	1916
2.233.3	Description	1916
2.233.4	Restart, fix_modify, output, run start/stop, minimize info	1917
2.233.5	Restrictions	1917
2.233.6	Related commands	1917
2.233.7	Default	1917
2.234	fix sgcmc command	1917
2.234.1	Syntax	1917
2.234.2	Examples	1918
2.234.3	Description	1918
2.234.4	Restart, fix_modify, output, run start/stop, minimize info	1919
2.234.5	Restrictions	1920
2.234.6	Default	1920
2.235	fix shake command	1920
2.236	fix rattle command	1920
2.236.1	Syntax	1920
2.236.2	Examples	1921
2.236.3	Description	1921
2.236.4	Restart, fix_modify, output, run start/stop, minimize info	1924
2.236.5	Restrictions	1924
2.236.6	Related commands	1924
2.236.7	Default	1924
2.237	fix shardlow command	1924
2.237.1	Syntax	1925
2.237.2	Examples	1925
2.237.3	Description	1925
2.237.4	Restrictions	1925
2.237.5	Related commands	1926
2.237.6	Default	1926
2.238	fix smd command	1926
2.238.1	Syntax	1926
2.238.2	Examples	1926
2.238.3	Description	1926
2.238.4	Restart, fix_modify, output, run start/stop, minimize info	1927
2.238.5	Restrictions	1928
2.238.6	Related commands	1928
2.238.7	Default	1928
2.239	fix smd/adjust_dt command	1928
2.239.1	Syntax	1928
2.239.2	Examples	1928
2.239.3	Description	1928
2.239.4	Restart, fix_modify, output, run start/stop, minimize info	1929
2.239.5	Restrictions	1929
2.239.6	Related commands	1929
2.239.7	Default	1929
2.240	fix smd/integrate_tlsph command	1929
2.240.1	Syntax	1929
2.240.2	Examples	1929

2.240.3	Description	1929
2.240.4	Restart, fix_modify, output, run start/stop, minimize info	1929
2.240.5	Restrictions	1930
2.240.6	Related commands	1930
2.240.7	Default	1930
2.241	fix smd/integrate_ulsph command	1930
2.241.1	Syntax	1930
2.241.2	Examples	1930
2.241.3	Description	1930
2.241.4	Restart, fix_modify, output, run start/stop, minimize info	1931
2.241.5	Restrictions	1931
2.241.6	Related commands	1931
2.241.7	Default	1931
2.242	fix smd/move_tri_surf command	1931
2.242.1	Syntax	1931
2.242.2	Examples	1931
2.242.3	Description	1931
2.242.4	Restart, fix_modify, output, run start/stop, minimize info	1932
2.242.5	Restrictions	1932
2.242.6	Related commands	1932
2.242.7	Default	1932
2.243	fix smd/setvel command	1932
2.243.1	Syntax	1932
2.243.2	Examples	1932
2.243.3	Description	1933
2.243.4	Restart, fix_modify, output, run start/stop, minimize info	1933
2.243.5	Restrictions	1933
2.243.6	Related commands	1933
2.243.7	Default	1933
2.244	fix smd/wall_surface command	1933
2.244.1	Syntax	1933
2.244.2	Examples	1934
2.244.3	Description	1934
2.244.4	Dump image info	1934
2.244.5	Restart, fix_modify, output, run start/stop, minimize info	1934
2.244.6	Restrictions	1934
2.244.7	Related commands	1935
2.244.8	Default	1935
2.245	fix sph command	1935
2.245.1	Syntax	1935
2.245.2	Examples	1935
2.245.3	Description	1935
2.245.4	Restart, fix_modify, output, run start/stop, minimize info	1935
2.245.5	Restrictions	1935
2.245.6	Related commands	1935
2.245.7	Default	1936
2.246	fix sph/stationary command	1936
2.246.1	Syntax	1936
2.246.2	Examples	1936
2.246.3	Description	1936
2.246.4	Restart, fix_modify, output, run start/stop, minimize info	1936
2.246.5	Restrictions	1936
2.246.6	Related commands	1936
2.246.7	Default	1936

2.247	fix spring command	1937
2.247.1	Syntax	1937
2.247.2	Examples	1937
2.247.3	Description	1937
2.247.4	Restart, fix_modify, output, run start/stop, minimize info	1938
2.247.5	Restrictions	1939
2.247.6	Related commands	1939
2.247.7	Default	1939
2.248	fix spring/chunk command	1939
2.248.1	Syntax	1939
2.248.2	Examples	1939
2.248.3	Description	1939
2.248.4	Restart, fix_modify, output, run start/stop, minimize info	1940
2.248.5	Restrictions	1940
2.248.6	Related commands	1940
2.248.7	Default	1940
2.249	fix spring/rg command	1940
2.249.1	Syntax	1940
2.249.2	Examples	1941
2.249.3	Description	1941
2.249.4	Restart, fix_modify, output, run start/stop, minimize info	1941
2.249.5	Restrictions	1941
2.249.6	Related commands	1941
2.249.7	Default	1942
2.250	fix spring/self command	1942
2.250.1	Syntax	1942
2.250.2	Examples	1942
2.250.3	Description	1942
2.250.4	Restart, fix_modify, output, run start/stop, minimize info	1942
2.250.5	Restrictions	1943
2.250.6	Related commands	1943
2.250.7	Default	1943
2.251	fix srd command	1943
2.251.1	Syntax	1943
2.251.2	Examples	1944
2.251.3	Description	1944
2.251.4	Restart, fix_modify, output, run start/stop, minimize info	1948
2.251.5	Restrictions	1948
2.251.6	Related commands	1948
2.251.7	Default	1948
2.252	fix store/force command	1949
2.252.1	Syntax	1949
2.252.2	Examples	1949
2.252.3	Description	1949
2.252.4	Restart, fix_modify, output, run start/stop, minimize info	1949
2.252.5	Restrictions	1949
2.252.6	Related commands	1949
2.252.7	Default	1950
2.253	fix store/state command	1950
2.253.1	Syntax	1950
2.253.2	Examples	1951
2.253.3	Description	1951
2.253.4	Restart, fix_modify, output, run start/stop, minimize info	1952
2.253.5	Restrictions	1953

2.253.6	Related commands	1953
2.253.7	Default	1953
2.254	fix surface/global command	1953
2.254.1	Syntax	1953
2.254.2	Examples	1954
2.254.3	Description	1954
2.254.4	Dump image info	1956
2.254.5	Restart, fix_modify, output, run start/stop, minimize info	1957
2.254.6	Restrictions	1958
2.254.7	Related commands	1958
2.254.8	Default	1958
2.255	fix surface/local command	1959
2.255.1	Syntax	1959
2.255.2	Examples	1959
2.255.3	Description	1959
2.255.4	Restart, fix_modify, output, run start/stop, minimize info	1961
2.255.5	Restrictions	1961
2.255.6	Related commands	1961
2.255.7	Default	1961
2.256	fix temp/berendsen command	1961
2.256.1	Syntax	1961
2.256.2	Examples	1962
2.256.3	Description	1962
2.256.4	Restart, fix_modify, output, run start/stop, minimize info	1963
2.256.5	Restrictions	1963
2.256.6	Related commands	1964
2.256.7	Default	1964
2.257	fix temp/csvr command	1964
2.258	fix temp/csld command	1964
2.258.1	Syntax	1964
2.258.2	Examples	1964
2.258.3	Description	1964
2.258.4	Restart, fix_modify, output, run start/stop, minimize info	1965
2.258.5	Restrictions	1966
2.258.6	Related commands	1966
2.258.7	Default	1966
2.259	fix temp/rescale command	1966
2.259.1	Syntax	1966
2.259.2	Examples	1967
2.259.3	Description	1967
2.259.4	Restart, fix_modify, output, run start/stop, minimize info	1968
2.259.5	Restrictions	1968
2.259.6	Related commands	1969
2.259.7	Default	1969
2.260	fix temp/rescale/eff command	1969
2.260.1	Syntax	1969
2.260.2	Examples	1969
2.260.3	Description	1969
2.260.4	Restart, fix_modify, output, run start/stop, minimize info	1969
2.260.5	Restrictions	1970
2.260.6	Related commands	1970
2.260.7	Default	1970
2.261	fix tfmc command	1970
2.261.1	Syntax	1970

2.261.2	Examples	1970
2.261.3	Description	1970
2.261.4	Restart, fix_modify, output, run start/stop, minimize info	1971
2.261.5	Restrictions	1971
2.261.6	Related commands	1972
2.261.7	Default	1972
2.262	fix tgnvt/drude command	1972
2.263	fix tgnpt/drude command	1972
2.263.1	Syntax	1972
2.263.2	Examples	1973
2.263.3	Description	1973
2.263.4	Restart, fix_modify, output, run start/stop, minimize info	1975
2.263.5	Restrictions	1976
2.263.6	Related commands	1976
2.263.7	Default	1976
2.264	fix thermal/conductivity command	1976
2.264.1	Syntax	1976
2.264.2	Examples	1976
2.264.3	Description	1977
2.264.4	Restart, fix_modify, output, run start/stop, minimize info	1978
2.264.5	Restrictions	1978
2.264.6	Related commands	1978
2.264.7	Default	1978
2.265	fix ti/spring command	1978
2.265.1	Syntax	1978
2.265.2	Example	1979
2.265.3	Description	1979
2.265.4	Restart, fix_modify, output, run start/stop, minimize info	1980
2.265.5	Related commands	1980
2.265.6	Restrictions	1980
2.265.7	Default	1980
2.266	fix tmd command	1981
2.266.1	Syntax	1981
2.266.2	Examples	1981
2.266.3	Description	1981
2.266.4	Restart, fix_modify, output, run start/stop, minimize info	1982
2.266.5	Restrictions	1982
2.266.6	Related commands	1982
2.266.7	Default	1982
2.267	fix ttm command	1983
2.268	fix ttm/grid command	1983
2.269	fix ttm/mod command	1983
2.270	fix ttm/thermal command	1983
2.270.1	Syntax	1983
2.270.2	Examples	1984
2.270.3	Description	1984
2.270.4	Restart, fix_modify, output, run start/stop, minimize info	1988
2.270.5	Restrictions	1989
2.270.6	Related commands	1989
2.270.7	Default	1989
2.271	fix tune/kspc command	1989
2.271.1	Syntax	1989
2.271.2	Examples	1990
2.271.3	Description	1990

2.271.4	Restrictions	1990
2.271.5	Related commands	1990
2.271.6	Default	1991
2.272	fix vector command	1991
2.272.1	Syntax	1991
2.272.2	Examples	1991
2.272.3	Description	1991
2.272.4	Restart, fix_modify, output, run start/stop, minimize info	1992
2.272.5	Restrictions	1993
2.272.6	Related commands	1993
2.272.7	Defaults	1993
2.273	fix viscosity command	1993
2.273.1	Syntax	1993
2.273.2	Examples	1993
2.273.3	Description	1994
2.273.4	Restart, fix_modify, output, run start/stop, minimize info	1995
2.273.5	Restrictions	1995
2.273.6	Related commands	1995
2.273.7	Default	1995
2.274	fix viscous command	1995
2.274.1	Syntax	1995
2.274.2	Examples	1996
2.274.3	Description	1996
2.274.4	Restart, fix_modify, output, run start/stop, minimize info	1997
2.274.5	Restrictions	1997
2.274.6	Related commands	1997
2.274.7	Default	1997
2.275	fix viscous/nonlinear command	1997
2.275.1	Syntax	1997
2.275.2	Examples	1997
2.275.3	Description	1998
2.275.4	Restrictions	1998
2.275.5	Restart, fix_modify, output, run start/stop, minimize info	1998
2.275.6	Related commands	1998
2.275.7	Default	1998
2.276	fix viscous/sphere command	1998
2.276.1	Syntax	1999
2.276.2	Examples	1999
2.276.3	Description	1999
2.276.4	Restart, fix_modify, output, run start/stop, minimize info	1999
2.276.5	Restrictions	2000
2.276.6	Related commands	2000
2.276.7	Default	2000
2.277	fix wall/lj93 command	2000
2.278	fix wall/lj126 command	2000
2.279	fix wall/lj1043 command	2000
2.280	fix wall/colloid command	2000
2.281	fix wall/harmonic command	2000
2.282	fix wall/harmonic/outside command	2001
2.283	fix wall/lepton command	2001
2.284	fix wall/morse command	2001
2.285	fix wall/table command	2001
2.285.1	Syntax	2001
2.285.2	Examples	2002

	2.285.3	Description	2002
	2.285.4	Lepton expression syntax and features	2006
	2.285.5	Table file format	2007
	2.285.6	Dump image info	2007
	2.285.7	Restart, fix_modify, output, run start/stop, minimize info	2008
	2.285.8	Restrictions	2009
	2.285.9	Related commands	2009
	2.285.10	Default	2009
2.286		fix wall/body/polygon command	2009
	2.286.1	Syntax	2009
	2.286.2	Examples	2009
	2.286.3	Description	2010
	2.286.4	Dump image info	2010
	2.286.5	Restart, fix_modify, output, run start/stop, minimize info	2010
	2.286.6	Restrictions	2010
	2.286.7	Related commands	2011
	2.286.8	Default	2011
2.287		fix wall/body/polyhedron command	2011
	2.287.1	Syntax	2011
	2.287.2	Examples	2011
	2.287.3	Description	2011
	2.287.4	Dump image info	2012
	2.287.5	Restart, fix_modify, output, run start/stop, minimize info	2012
	2.287.6	Restrictions	2012
	2.287.7	Related commands	2012
	2.287.8	Default	2012
2.288		fix wall/ees command	2013
2.289		fix wall/region/ees command	2013
	2.289.1	Syntax	2013
	2.289.2	Examples	2013
	2.289.3	Description	2013
	2.289.4	Restart, fix_modify, output, run start/stop, minimize info	2014
	2.289.5	Dump image info	2015
	2.289.6	Restrictions	2015
	2.289.7	Related commands	2015
	2.289.8	Default	2015
2.290		fix wall/flow command	2016
	2.290.1	Syntax	2016
	2.290.2	Examples	2016
	2.290.3	Description	2016
	2.290.4	Restart, fix_modify, output, run start/stop, minimize info	2017
	2.290.5	Restrictions	2018
	2.290.6	Related commands	2018
	2.290.7	Default	2018
2.291		fix wall/gran command	2018
	2.291.1	Syntax	2018
	2.291.2	Examples	2019
	2.291.3	Description	2019
	2.291.4	Restart, fix_modify, output, run start/stop, minimize info	2021
	2.291.5	Dump image info	2022
	2.291.6	Restrictions	2022
	2.291.7	Related commands	2022
	2.291.8	Default	2022
2.292		fix wall/gran/region command	2022

2.292.1	Syntax	2022
2.292.2	Examples	2023
2.292.3	Description	2023
2.292.4	Restart, fix_modify, output, run start/stop, minimize info	2026
2.292.5	Dump image info	2026
2.292.6	Restrictions	2026
2.292.7	Related commands	2027
2.292.8	Default	2027
2.293	fix wall/piston command	2027
2.293.1	Syntax	2027
2.293.2	Examples	2027
2.293.3	Description	2027
2.293.4	Restart, fix_modify, output, run start/stop, minimize info	2028
2.293.5	Restrictions	2028
2.293.6	Related commands	2028
2.293.7	Default	2028
2.294	fix wall/reflect command	2028
2.294.1	Syntax	2028
2.294.2	Examples	2029
2.294.3	Description	2029
2.294.4	Dump image info	2030
2.294.5	Restart, fix_modify, output, run start/stop, minimize info	2031
2.294.6	Restrictions	2031
2.294.7	Related commands	2031
2.294.8	Default	2031
2.295	fix wall/reflect/stochastic command	2031
2.295.1	Syntax	2031
2.295.2	Examples	2032
2.295.3	Description	2032
2.295.4	Dump image info	2032
2.295.5	Restrictions	2033
2.295.6	Related commands	2033
2.295.7	Default	2033
2.296	fix wall/region command	2033
2.296.1	Syntax	2033
2.296.2	Examples	2034
2.296.3	Description	2034
2.296.4	Restart, fix_modify, output, run start/stop, minimize info	2036
2.296.5	Dump image info	2036
2.296.6	Restrictions	2036
2.296.7	Related commands	2037
2.296.8	Default	2037
2.297	fix wall/srd command	2037
2.297.1	Syntax	2037
2.297.2	Examples	2037
2.297.3	Description	2037
2.297.4	Dump image info	2039
2.297.5	Restart, fix_modify, output, run start/stop, minimize info	2039
2.297.6	Restrictions	2040
2.297.7	Related commands	2040
2.297.8	Default	2040
2.298	fix widom command	2040
2.298.1	Syntax	2040
2.298.2	Examples	2040

2.298.3	Description	2041
2.298.4	Restart, fix_modify, output, run start/stop, minimize info	2042
2.298.5	Restrictions	2042
2.298.6	Related commands	2043
2.298.7	Default	2043

3 Compute Styles 2045

3.1	compute ackland/atom command	2045
3.1.1	Syntax	2045
3.1.2	Examples	2045
3.1.3	Description	2045
3.1.4	Output info	2046
3.1.5	Restrictions	2046
3.1.6	Related commands	2046
3.1.7	Default	2046
3.2	compute adf command	2046
3.2.1	Syntax	2046
3.2.2	Examples	2047
3.2.3	Description	2047
3.2.4	Output info	2049
3.2.5	Restrictions	2049
3.2.6	Related commands	2049
3.2.7	Default	2049
3.3	compute angle command	2049
3.3.1	Syntax	2049
3.3.2	Examples	2050
3.3.3	Description	2050
3.3.4	Output info	2050
3.3.5	Restrictions	2050
3.3.6	Related commands	2050
3.3.7	Default	2050
3.4	compute angle/local command	2050
3.4.1	Syntax	2050
3.4.2	Examples	2051
3.4.3	Description	2051
3.4.4	Output info	2052
3.4.5	Restrictions	2052
3.4.6	Related commands	2052
3.4.7	Default	2052
3.5	compute angmom/chunk command	2052
3.5.1	Syntax	2052
3.5.2	Examples	2052
3.5.3	Description	2052
3.5.4	Output info	2053
3.5.5	Restrictions	2053
3.5.6	Related commands	2053
3.5.7	Default	2053
3.6	compute ave/sphere/atom command	2053
3.6.1	Syntax	2053
3.6.2	Examples	2054
3.6.3	Description	2054
3.6.4	Output info	2055
3.6.5	Restrictions	2055
3.6.6	Related commands	2055

	3.6.7	Default	2055
3.7		compute basal/atom command	2055
	3.7.1	Syntax	2055
	3.7.2	Examples	2055
	3.7.3	Description	2055
	3.7.4	Output info	2056
	3.7.5	Restrictions	2056
	3.7.6	Related commands	2056
	3.7.7	Default	2056
3.8		compute body/local command	2056
	3.8.1	Syntax	2056
	3.8.2	Examples	2056
	3.8.3	Description	2056
	3.8.4	Output info	2057
	3.8.5	Restrictions	2057
	3.8.6	Related commands	2057
	3.8.7	Default	2057
3.9		compute bond command	2057
	3.9.1	Syntax	2057
	3.9.2	Examples	2058
	3.9.3	Description	2058
	3.9.4	Output info	2058
	3.9.5	Restrictions	2058
	3.9.6	Related commands	2058
	3.9.7	Default	2058
3.10		compute bond/local command	2058
	3.10.1	Syntax	2058
	3.10.2	Examples	2059
	3.10.3	Description	2059
	3.10.4	Output info	2061
	3.10.5	Restrictions	2061
	3.10.6	Related commands	2061
	3.10.7	Default	2061
3.11		compute born/matrix command	2061
	3.11.1	Syntax	2061
	3.11.2	Examples	2062
	3.11.3	Description	2062
	3.11.4	Restrictions	2064
	3.11.5	Default	2064
3.12		compute centro/atom command	2064
	3.12.1	Syntax	2064
	3.12.2	Examples	2064
	3.12.3	Description	2065
	3.12.4	Output info	2065
	3.12.5	Restrictions	2066
	3.12.6	Related commands	2066
	3.12.7	Default	2066
3.13		compute chunk/atom command	2066
	3.13.1	Syntax	2066
	3.13.2	Examples	2068
	3.13.3	Description	2068
	3.13.4	Output info	2074
	3.13.5	Dump image info	2074
	3.13.6	Restrictions	2075

	3.13.7	Related commands	2075
	3.13.8	Default	2075
3.14		compute chunk/spread/atom command	2075
	3.14.1	Syntax	2075
	3.14.2	Examples	2076
	3.14.3	Description	2076
	3.14.4	Output info	2078
	3.14.5	Restrictions	2078
	3.14.6	Related commands	2078
	3.14.7	Default	2078
3.15		compute cluster/atom command	2078
3.16		compute fragment/atom command	2078
3.17		compute aggregate/atom command	2078
	3.17.1	Syntax	2078
	3.17.2	Examples	2079
	3.17.3	Description	2079
	3.17.4	Output info	2080
	3.17.5	Restrictions	2080
	3.17.6	Related commands	2080
	3.17.7	Default	2080
3.18		compute cna/atom command	2080
	3.18.1	Syntax	2080
	3.18.2	Examples	2080
	3.18.3	Description	2080
	3.18.4	Output info	2081
	3.18.5	Restrictions	2081
	3.18.6	Related commands	2081
	3.18.7	Default	2082
3.19		compute cnp/atom command	2082
	3.19.1	Syntax	2082
	3.19.2	Examples	2082
	3.19.3	Description	2082
	3.19.4	Output info	2083
	3.19.5	Restrictions	2083
	3.19.6	Related commands	2083
	3.19.7	Default	2084
3.20		compute com command	2084
	3.20.1	Syntax	2084
	3.20.2	Examples	2084
	3.20.3	Description	2084
	3.20.4	Output info	2084
	3.20.5	Restrictions	2084
	3.20.6	Related commands	2084
	3.20.7	Default	2085
3.21		compute com/chunk command	2085
	3.21.1	Syntax	2085
	3.21.2	Examples	2085
	3.21.3	Description	2085
	3.21.4	Output info	2086
	3.21.5	Restrictions	2086
	3.21.6	Related commands	2086
	3.21.7	Default	2086
3.22		compute composition/atom command	2086
	3.22.1	Syntax	2086

	3.22.2	Examples	2086
	3.22.3	Description	2087
	3.22.4	Output info	2088
	3.22.5	Restrictions	2088
	3.22.6	Related commands	2088
	3.22.7	Default	2088
3.23		compute contact/atom command	2088
	3.23.1	Syntax	2088
	3.23.2	Examples	2088
	3.23.3	Description	2088
	3.23.4	Output info	2089
	3.23.5	Restrictions	2089
	3.23.6	Related commands	2089
	3.23.7	Default	2089
3.24		compute coord/atom command	2089
	3.24.1	Syntax	2089
	3.24.2	Examples	2089
	3.24.3	Description	2090
	3.24.4	Output info	2091
	3.24.5	Restrictions	2091
	3.24.6	Related commands	2091
	3.24.7	Default	2091
3.25		compute count/type command	2091
	3.25.1	Syntax	2091
	3.25.2	Examples	2091
	3.25.3	Description	2092
	3.25.4	Output info	2093
	3.25.5	Restrictions	2093
	3.25.6	Related commands	2093
	3.25.7	Default	2093
3.26		compute damage/atom command	2093
	3.26.1	Syntax	2093
	3.26.2	Examples	2093
	3.26.3	Description	2093
	3.26.4	Output info	2094
	3.26.5	Restrictions	2094
	3.26.6	Related commands	2094
	3.26.7	Default	2094
3.27		compute dihedral command	2094
	3.27.1	Syntax	2094
	3.27.2	Examples	2094
	3.27.3	Description	2094
	3.27.4	Output info	2094
	3.27.5	Restrictions	2095
	3.27.6	Related commands	2095
	3.27.7	Default	2095
3.28		compute dihedral/local command	2095
	3.28.1	Syntax	2095
	3.28.2	Examples	2095
	3.28.3	Description	2095
	3.28.4	Output info	2096
	3.28.5	Restrictions	2096
	3.28.6	Related commands	2096
	3.28.7	Default	2097

3.29	compute dilatation/atom command	2097
3.29.1	Syntax	2097
3.29.2	Examples	2097
3.29.3	Description	2097
3.29.4	Output info	2097
3.29.5	Restrictions	2097
3.29.6	Related commands	2097
3.29.7	Default	2097
3.30	compute dipole command	2098
3.31	compute dipole/tip4p command	2098
3.31.1	Syntax	2098
3.31.2	Examples	2098
3.31.3	Description	2098
3.31.4	Output info	2098
3.31.5	Restrictions	2098
3.31.6	Related commands	2099
3.31.7	Default	2099
3.32	compute dipole/chunk command	2099
3.33	compute dipole/tip4p/chunk command	2099
3.33.1	Syntax	2099
3.33.2	Examples	2099
3.33.3	Description	2099
3.33.4	Output info	2100
3.33.5	Restrictions	2100
3.33.6	Related commands	2100
3.33.7	Default	2100
3.34	compute displace/atom command	2100
3.34.1	Syntax	2100
3.34.2	Examples	2101
3.34.3	Description	2101
3.34.4	Output info	2102
3.34.5	Restrictions	2102
3.34.6	Related commands	2102
3.34.7	Default	2102
3.35	compute dpd command	2102
3.35.1	Syntax	2102
3.35.2	Examples	2102
3.35.3	Description	2103
3.35.4	Output info	2103
3.35.5	Restrictions	2103
3.35.6	Related commands	2103
3.35.7	Default	2103
3.36	compute dpd/atom command	2104
3.36.1	Syntax	2104
3.36.2	Examples	2104
3.36.3	Description	2104
3.36.4	Output info	2104
3.36.5	Restrictions	2104
3.36.6	Related commands	2104
3.36.7	Default	2104
3.37	compute edpd/temp/atom command	2104
3.37.1	Syntax	2104
3.37.2	Examples	2105
3.37.3	Description	2105

	3.37.4	Output info	2105
	3.37.5	Restrictions	2105
	3.37.6	Related commands	2105
	3.37.7	Default	2105
3.38		compute efield/atom command	2105
	3.38.1	Syntax	2105
	3.38.2	Examples	2106
	3.38.3	Description	2106
	3.38.4	Output info	2106
	3.38.5	Restrictions	2106
	3.38.6	Related commands	2106
	3.38.7	Default	2106
3.39		compute efield/wolf/atom command	2106
	3.39.1	Syntax	2106
	3.39.2	Examples	2107
	3.39.3	Description	2107
	3.39.4	Output info	2107
	3.39.5	Restrictions	2108
	3.39.6	Related commands	2108
	3.39.7	Default	2108
3.40		compute entropy/atom command	2108
	3.40.1	Syntax	2108
	3.40.2	Examples	2108
	3.40.3	Description	2108
	3.40.4	Output info	2109
	3.40.5	Restrictions	2110
	3.40.6	Related commands	2110
	3.40.7	Default	2110
3.41		compute erotate/asphere command	2110
	3.41.1	Syntax	2110
	3.41.2	Examples	2110
	3.41.3	Description	2110
	3.41.4	Output info	2111
	3.41.5	Restrictions	2111
	3.41.6	Related commands	2111
	3.41.7	Default	2111
3.42		compute erotate/rigid command	2111
	3.42.1	Syntax	2111
	3.42.2	Examples	2112
	3.42.3	Description	2112
	3.42.4	Output info	2112
	3.42.5	Restrictions	2112
	3.42.6	Related commands	2112
	3.42.7	Default	2112
3.43		compute erotate/sphere command	2112
	3.43.1	Syntax	2112
	3.43.2	Examples	2113
	3.43.3	Description	2113
	3.43.4	Output info	2113
	3.43.5	Restrictions	2113
	3.43.6	Related commands	2113
	3.43.7	Default	2113
3.44		compute erotate/sphere/atom command	2114
	3.44.1	Syntax	2114

	3.44.2	Examples	2114
	3.44.3	Description	2114
	3.44.4	Output info	2114
	3.44.5	Restrictions	2115
	3.44.6	Related commands	2115
	3.44.7	Default	2115
3.45		compute event/displace command	2115
	3.45.1	Syntax	2115
	3.45.2	Examples	2115
	3.45.3	Description	2115
	3.45.4	Output info	2115
	3.45.5	Restrictions	2116
	3.45.6	Related commands	2116
	3.45.7	Default	2116
3.46		compute fabric command	2116
	3.46.1	Syntax	2116
	3.46.2	Examples	2116
	3.46.3	Description	2116
	3.46.4	Output info	2118
	3.46.5	Restrictions	2118
	3.46.6	Related commands	2118
	3.46.7	Default	2118
3.47		compute fep command	2118
	3.47.1	Syntax	2118
	3.47.2	Examples	2119
	3.47.3	Description	2119
	3.47.4	Output info	2121
	3.47.5	Restrictions	2121
	3.47.6	Related commands	2122
	3.47.7	Default	2122
3.48		compute fep/ta command	2122
	3.48.1	Syntax	2122
	3.48.2	Examples	2122
	3.48.3	Description	2122
	3.48.4	Output info	2123
	3.48.5	Restrictions	2123
	3.48.6	Related commands	2123
	3.48.7	Default	2123
3.49		compute gaussian/grid/local command	2123
	3.49.1	Syntax	2123
	3.49.2	Examples	2124
	3.49.3	Description	2124
	3.49.4	Output info	2124
	3.49.5	Restrictions	2124
	3.49.6	Related commands	2124
3.50		compute global/atom command	2125
	3.50.1	Syntax	2125
	3.50.2	Examples	2125
	3.50.3	Description	2125
	3.50.4	Output info	2127
	3.50.5	Restrictions	2127
	3.50.6	Related commands	2127
	3.50.7	Default	2128
3.51		compute group/group command	2128

	3.51.1	Syntax	2128
	3.51.2	Examples	2128
	3.51.3	Description	2128
	3.51.4	Output info	2129
	3.51.5	Restrictions	2129
	3.51.6	Related commands	2130
	3.51.7	Default	2130
3.52		compute gyration command	2130
	3.52.1	Syntax	2130
	3.52.2	Examples	2130
	3.52.3	Description	2130
	3.52.4	Output info	2131
	3.52.5	Restrictions	2131
	3.52.6	Related commands	2131
	3.52.7	Default	2131
3.53		compute gyration/chunk command	2131
	3.53.1	Syntax	2131
	3.53.2	Examples	2131
	3.53.3	Description	2131
	3.53.4	Output info	2132
	3.53.5	Restrictions	2132
	3.53.6	Related commands	2132
	3.53.7	Default	2133
3.54		compute gyration/shape command	2133
	3.54.1	Syntax	2133
	3.54.2	Examples	2133
	3.54.3	Description	2133
	3.54.4	Output info	2134
	3.54.5	Restrictions	2134
	3.54.6	Related commands	2134
	3.54.7	Default	2134
3.55		compute gyration/shape/chunk command	2134
	3.55.1	Syntax	2134
	3.55.2	Examples	2134
	3.55.3	Description	2134
	3.55.4	Output info	2135
	3.55.5	Restrictions	2135
	3.55.6	Related commands	2135
	3.55.7	Default	2135
3.56		compute hbond/local command	2135
	3.56.1	Syntax	2135
	3.56.2	Examples	2136
	3.56.3	Description	2136
	3.56.4	Output info	2138
	3.56.5	Dump image info	2139
	3.56.6	Restrictions	2140
	3.56.7	Related commands	2140
	3.56.8	Default	2140
3.57		compute heat/flux command	2140
	3.57.1	Syntax	2140
	3.57.2	Examples	2140
	3.57.3	Description	2140
	3.57.4	Output info	2142
	3.57.5	Restrictions	2142

	3.57.6	Related commands	2142
	3.57.7	Default	2142
3.58		compute hexorder/atom command	2144
	3.58.1	Syntax	2144
	3.58.2	Examples	2144
	3.58.3	Description	2144
	3.58.4	Output info	2145
	3.58.5	Restrictions	2145
	3.58.6	Related commands	2145
	3.58.7	Default	2145
3.59		compute hma command	2146
	3.59.1	Syntax	2146
	3.59.2	Examples	2146
	3.59.3	Description	2146
	3.59.4	Output info	2148
	3.59.5	Restrictions	2148
	3.59.6	Related commands	2148
	3.59.7	Default	2148
3.60		compute improper command	2148
	3.60.1	Syntax	2148
	3.60.2	Examples	2148
	3.60.3	Description	2149
	3.60.4	Output info	2149
	3.60.5	Restrictions	2149
	3.60.6	Related commands	2149
	3.60.7	Default	2149
3.61		compute improper/local command	2149
	3.61.1	Syntax	2149
	3.61.2	Examples	2149
	3.61.3	Description	2149
	3.61.4	Output info	2150
	3.61.5	Restrictions	2150
	3.61.6	Related commands	2150
	3.61.7	Default	2150
3.62		compute inertia/chunk command	2150
	3.62.1	Syntax	2150
	3.62.2	Examples	2151
	3.62.3	Description	2151
	3.62.4	Output info	2151
	3.62.5	Restrictions	2151
	3.62.6	Related commands	2151
	3.62.7	Default	2152
3.63		compute ke command	2152
	3.63.1	Syntax	2152
	3.63.2	Examples	2152
	3.63.3	Description	2152
	3.63.4	Output info	2152
	3.63.5	Restrictions	2152
	3.63.6	Related commands	2152
	3.63.7	Default	2152
3.64		compute ke/atom command	2153
	3.64.1	Syntax	2153
	3.64.2	Examples	2153
	3.64.3	Description	2153

	3.64.4	Output info	2153
	3.64.5	Restrictions	2153
	3.64.6	Related commands	2153
	3.64.7	Default	2154
3.65		compute ke/atom/eff command	2154
	3.65.1	Syntax	2154
	3.65.2	Examples	2154
	3.65.3	Description	2154
	3.65.4	Output info	2154
	3.65.5	Restrictions	2155
	3.65.6	Related commands	2155
	3.65.7	Default	2155
3.66		compute ke/eff command	2155
	3.66.1	Syntax	2155
	3.66.2	Examples	2155
	3.66.3	Description	2155
	3.66.4	Output info	2156
	3.66.5	Restrictions	2156
	3.66.6	Related commands	2156
	3.66.7	Default	2156
3.67		compute ke/rigid command	2156
	3.67.1	Syntax	2156
	3.67.2	Examples	2156
	3.67.3	Description	2156
	3.67.4	Output info	2156
	3.67.5	Restrictions	2157
	3.67.6	Related commands	2157
	3.67.7	Default	2157
3.68		compute mliap command	2157
	3.68.1	Syntax	2157
	3.68.2	Examples	2157
	3.68.3	Description	2157
	3.68.4	Output info	2159
	3.68.5	Restrictions	2159
	3.68.6	Related commands	2159
	3.68.7	Default	2159
3.69		compute momentum command	2159
	3.69.1	Syntax	2159
	3.69.2	Examples	2159
	3.69.3	Description	2159
	3.69.4	Output info	2160
	3.69.5	Restrictions	2160
	3.69.6	Related commands	2160
	3.69.7	Default	2160
3.70		compute msd command	2160
	3.70.1	Syntax	2160
	3.70.2	Examples	2160
	3.70.3	Description	2160
	3.70.4	Output info	2161
	3.70.5	Restrictions	2161
	3.70.6	Related commands	2161
	3.70.7	Default	2161
3.71		compute msd/chunk command	2162
	3.71.1	Syntax	2162

3.71.2	Examples	2162
3.71.3	Description	2162
3.71.4	Output info	2163
3.71.5	Restrictions	2163
3.71.6	Related commands	2163
3.71.7	Default	2163
3.72	compute msd/nongauss command	2163
3.72.1	Syntax	2163
3.72.2	Examples	2164
3.72.3	Description	2164
3.72.4	Output info	2164
3.72.5	Restrictions	2164
3.72.6	Related commands	2164
3.72.7	Default	2164
3.73	compute nbond/atom command	2165
3.73.1	Syntax	2165
3.73.2	Examples	2165
3.73.3	Description	2165
3.73.4	Output info	2165
3.73.5	Restrictions	2165
3.73.6	Related commands	2165
3.73.7	Default	2165
3.74	compute omega/chunk command	2165
3.74.1	Syntax	2165
3.74.2	Examples	2166
3.74.3	Description	2166
3.74.4	Output info	2166
3.74.5	Restrictions	2166
3.74.6	Related commands	2167
3.74.7	Default	2167
3.75	compute orientorder/atom command	2167
3.75.1	Syntax	2167
3.75.2	Examples	2167
3.75.3	Description	2167
3.75.4	Output info	2169
3.75.5	Restrictions	2169
3.75.6	Related commands	2169
3.75.7	Default	2169
3.76	compute pace command	2170
3.76.1	Syntax	2170
3.76.2	Examples	2170
3.76.3	Description	2170
3.76.4	Output info	2172
3.76.5	Restrictions	2172
3.76.6	Related commands	2172
3.76.7	Default	2173
3.77	compute pair command	2173
3.77.1	Syntax	2173
3.77.2	Examples	2173
3.77.3	Description	2173
3.77.4	Output info	2174
3.77.5	Restrictions	2174
3.77.6	Related commands	2174
3.77.7	Default	2174

3.78	compute pair/local command	2174
3.78.1	Syntax	2174
3.78.2	Examples	2175
3.78.3	Description	2175
3.78.4	Output info	2176
3.78.5	Restrictions	2176
3.78.6	Related commands	2176
3.78.7	Default	2176
3.79	compute pe command	2177
3.79.1	Syntax	2177
3.79.2	Examples	2177
3.79.3	Description	2177
3.79.4	Output info	2177
3.79.5	Restrictions	2178
3.79.6	Related commands	2178
3.79.7	Default	2178
3.80	compute pe/atom command	2178
3.80.1	Syntax	2178
3.80.2	Examples	2178
3.80.3	Description	2178
3.80.4	Output info	2179
3.80.5	Restrictions	2179
3.80.6	Related commands	2179
3.80.7	Default	2179
3.81	compute plasticity/atom command	2179
3.81.1	Syntax	2179
3.81.2	Examples	2180
3.81.3	Description	2180
3.81.4	Output info	2180
3.81.5	Restrictions	2180
3.81.6	Related commands	2180
3.81.7	Default	2180
3.82	compute pod/atom command	2180
3.83	compute podd/atom command	2180
3.84	compute pod/local command	2180
3.85	compute pod/global command	2180
3.85.1	Syntax	2180
3.85.2	Examples	2181
3.85.3	Description	2181
3.85.4	Output info	2181
3.85.5	Restrictions	2182
3.85.6	Related commands	2182
3.85.7	Default	2182
3.86	compute pressure command	2182
3.86.1	Syntax	2182
3.86.2	Examples	2182
3.86.3	Description	2182
3.86.4	Output info	2183
3.86.5	Restrictions	2184
3.86.6	Related commands	2184
3.86.7	Default	2184
3.87	compute pressure/alchemy command	2184
3.87.1	Syntax	2184
3.87.2	Examples	2184

	3.87.3	Description	2184
	3.87.4	Output info	2185
	3.87.5	Restrictions	2185
	3.87.6	Related commands	2185
	3.87.7	Default	2185
3.88		compute pressure/uef command	2185
	3.88.1	Syntax	2185
	3.88.2	Examples	2185
	3.88.3	Description	2185
	3.88.4	Restrictions	2186
	3.88.5	Related commands	2186
	3.88.6	Default	2186
3.89		compute property/atom command	2186
	3.89.1	Syntax	2186
	3.89.2	Examples	2188
	3.89.3	Description	2188
	3.89.4	Output info	2190
	3.89.5	Restrictions	2190
	3.89.6	Related commands	2190
	3.89.7	Default	2190
3.90		compute property/chunk command	2190
	3.90.1	Syntax	2190
	3.90.2	Examples	2190
	3.90.3	Description	2191
	3.90.4	Output info	2191
	3.90.5	Restrictions	2192
	3.90.6	Related commands	2192
	3.90.7	Default	2192
3.91		compute property/grid command	2192
	3.91.1	Syntax	2192
	3.91.2	Examples	2192
	3.91.3	Description	2192
	3.91.4	Output info	2193
	3.91.5	Restrictions	2193
	3.91.6	Related commands	2193
	3.91.7	Default	2193
3.92		compute property/local command	2193
	3.92.1	Syntax	2193
	3.92.2	Examples	2194
	3.92.3	Description	2194
	3.92.4	Output info	2195
	3.92.5	Restrictions	2196
	3.92.6	Related commands	2196
	3.92.7	Default	2196
3.93		compute ptm/atom command	2196
	3.93.1	Syntax	2196
	3.93.2	Examples	2196
	3.93.3	Description	2196
	3.93.4	Output info	2197
	3.93.5	Restrictions	2198
	3.93.6	Related commands	2198
	3.93.7	Default	2198
3.94		compute rattlers/atom command	2198
	3.94.1	Syntax	2198

	3.94.2	Examples	2198
	3.94.3	Description	2198
	3.94.4	Output info	2199
	3.94.5	Restrictions	2199
	3.94.6	Related commands	2199
	3.94.7	Default	2199
3.95		compute rdf command	2199
	3.95.1	Syntax	2199
	3.95.2	Examples	2199
	3.95.3	Description	2200
	3.95.4	Output info	2201
	3.95.5	Restrictions	2202
	3.95.6	Related commands	2202
	3.95.7	Default	2202
3.96		compute reaxff/atom command	2202
	3.96.1	Syntax	2202
	3.96.2	Examples	2203
	3.96.3	Description	2203
	3.96.4	Output info	2203
	3.96.5	Restrictions	2203
	3.96.6	Related commands	2204
	3.96.7	Default	2204
3.97		compute reduce command	2204
3.98		compute reduce/region command	2204
	3.98.1	Syntax	2204
	3.98.2	Examples	2204
	3.98.3	Description	2205
	3.98.4	Output info	2207
	3.98.5	Restrictions	2207
	3.98.6	Related commands	2207
	3.98.7	Default	2207
3.99		compute reduce/chunk command	2207
	3.99.1	Syntax	2207
	3.99.2	Examples	2208
	3.99.3	Description	2208
	3.99.4	Output info	2209
	3.99.5	Restrictions	2209
	3.99.6	Related commands	2210
	3.99.7	Default	2210
3.100		compute rheo/property/atom command	2210
	3.100.1	Syntax	2210
	3.100.2	Examples	2210
	3.100.3	Description	2211
	3.100.4	Output info	2211
	3.100.5	Restrictions	2211
	3.100.6	Related commands	2211
	3.100.7	Default	2211
3.101		compute rigid/local command	2212
	3.101.1	Syntax	2212
	3.101.2	Examples	2212
	3.101.3	Description	2212
	3.101.4	Output info	2214
	3.101.5	Restrictions	2214
	3.101.6	Related commands	2214

	3.101.7	Default	2214
3.102	compute saed command		2214
	3.102.1	Syntax	2214
	3.102.2	Examples	2215
	3.102.3	Description	2215
	3.102.4	Output info	2218
	3.102.5	Restrictions	2218
	3.102.6	Related commands	2218
	3.102.7	Default	2218
3.103	compute slcsa/atom command		2218
	3.103.1	Syntax	2218
	3.103.2	Examples	2219
	3.103.3	Description	2219
	3.103.4	Output info	2220
	3.103.5	Restrictions	2220
	3.103.6	Related commands	2220
	3.103.7	Default	2220
3.104	compute slice command		2220
	3.104.1	Syntax	2220
	3.104.2	Examples	2221
	3.104.3	Description	2221
	3.104.4	Output info	2221
	3.104.5	Restrictions	2222
	3.104.6	Related commands	2222
	3.104.7	Default	2222
3.105	compute smd/contact/radius command		2222
	3.105.1	Syntax	2222
	3.105.2	Examples	2222
	3.105.3	Description	2222
	3.105.4	Output info	2222
	3.105.5	Restrictions	2222
	3.105.6	Related commands	2222
	3.105.7	Default	2223
3.106	compute smd/damage command		2223
	3.106.1	Syntax	2223
	3.106.2	Examples	2223
	3.106.3	Description	2223
	3.106.4	Restrictions	2223
	3.106.5	Related commands	2223
	3.106.6	Default	2223
3.107	compute smd/hourglass/error command		2223
	3.107.1	Syntax	2223
	3.107.2	Examples	2224
	3.107.3	Description	2224
	3.107.4	Restrictions	2224
	3.107.5	Related commands	2224
	3.107.6	Default	2224
3.108	compute smd/internal/energy command		2224
	3.108.1	Syntax	2224
	3.108.2	Examples	2224
	3.108.3	Description	2224
	3.108.4	Output Info	2225
	3.108.5	Restrictions	2225
	3.108.6	Related commands	2225

3.108.7	Default	2225
3.109	compute <code>smd/plastic/strain</code> command	2225
3.109.1	Syntax	2225
3.109.2	Examples	2225
3.109.3	Description	2225
3.109.4	Restrictions	2225
3.109.5	Related commands	2226
3.109.6	Default	2226
3.110	compute <code>smd/plastic/strain/rate</code> command	2226
3.110.1	Syntax	2226
3.110.2	Examples	2226
3.110.3	Description	2226
3.110.4	Restrictions	2226
3.110.5	Related commands	2226
3.110.6	Default	2226
3.111	compute <code>smd/rho</code> command	2226
3.111.1	Syntax	2226
3.111.2	Examples	2227
3.111.3	Description	2227
3.111.4	Output info	2227
3.111.5	Restrictions	2227
3.111.6	Related commands	2227
3.111.7	Default	2227
3.112	compute <code>smd/tlsph/defgrad</code> command	2227
3.112.1	Syntax	2227
3.112.2	Examples	2227
3.112.3	Description	2228
3.112.4	Output info	2228
3.112.5	Restrictions	2228
3.112.6	Related commands	2228
3.112.7	Default	2228
3.113	compute <code>smd/tlsph/dt</code> command	2228
3.113.1	Syntax	2228
3.113.2	Examples	2228
3.113.3	Description	2228
3.113.4	Output info	2229
3.113.5	Restrictions	2229
3.113.6	Related commands	2229
3.113.7	Default	2229
3.114	compute <code>smd/tlsph/num/neighs</code> command	2229
3.114.1	Syntax	2229
3.114.2	Examples	2229
3.114.3	Description	2229
3.114.4	Output info	2229
3.114.5	Restrictions	2229
3.114.6	Related commands	2230
3.114.7	Default	2230
3.115	compute <code>smd/tlsph/shape</code> command	2230
3.115.1	Syntax	2230
3.115.2	Examples	2230
3.115.3	Description	2230
3.115.4	Output info	2230
3.115.5	Restrictions	2230
3.115.6	Related commands	2230

3.115.7	Default	2230
3.116	compute smd/tlsph/strain command	2231
3.116.1	Syntax	2231
3.116.2	Examples	2231
3.116.3	Description	2231
3.116.4	Output info	2231
3.116.5	Restrictions	2231
3.116.6	Related commands	2231
3.116.7	Default	2231
3.117	compute smd/tlsph/strain/rate command	2231
3.117.1	Syntax	2231
3.117.2	Examples	2232
3.117.3	Description	2232
3.117.4	Output info	2232
3.117.5	Restrictions	2232
3.117.6	Related commands	2232
3.117.7	Default	2232
3.118	compute smd/tlsph/stress command	2232
3.118.1	Syntax	2232
3.118.2	Examples	2232
3.118.3	Description	2233
3.118.4	Output info	2233
3.118.5	Restrictions	2233
3.118.6	Related commands	2233
3.118.7	Default	2233
3.119	compute smd/triangle/vertices command	2233
3.119.1	Syntax	2233
3.119.2	Examples	2233
3.119.3	Description	2233
3.119.4	Output info	2234
3.119.5	Restrictions	2234
3.119.6	Related commands	2234
3.119.7	Default	2234
3.120	compute smd/ulsph/effm command	2234
3.120.1	Syntax	2234
3.120.2	Examples	2234
3.120.3	Description	2234
3.120.4	Output info	2234
3.120.5	Restrictions	2235
3.120.6	Related commands	2235
3.120.7	Default	2235
3.121	compute smd/ulsph/num/neighs command	2235
3.121.1	Syntax	2235
3.121.2	Examples	2235
3.121.3	Description	2235
3.121.4	Output info	2235
3.121.5	Restrictions	2235
3.121.6	Related commands	2235
3.121.7	Default	2236
3.122	compute smd/ulsph/strain command	2236
3.122.1	Syntax	2236
3.122.2	Examples	2236
3.122.3	Description	2236
3.122.4	Output info	2236

3.122.5	Restrictions	2236
3.122.6	Related commands	2236
3.122.7	Default	2236
3.123	compute <code>smd/ulsph/strain/rate</code> command	2236
3.123.1	Syntax	2236
3.123.2	Examples	2237
3.123.3	Description	2237
3.123.4	Output info	2237
3.123.5	Restrictions	2237
3.123.6	Related commands	2237
3.123.7	Default	2237
3.124	compute <code>smd/ulsph/stress</code> command	2237
3.124.1	Syntax	2237
3.124.2	Examples	2237
3.124.3	Description	2238
3.124.4	Output info	2238
3.124.5	Restrictions	2238
3.124.6	Related commands	2238
3.124.7	Default	2238
3.125	compute <code>smd/vol</code> command	2238
3.125.1	Syntax	2238
3.125.2	Examples	2238
3.125.3	Description	2238
3.125.4	Output info	2239
3.125.5	Restrictions	2239
3.125.6	Related commands	2239
3.125.7	Default	2239
3.126	compute <code>sna/atom</code> command	2239
3.127	compute <code>snad/atom</code> command	2239
3.128	compute <code>snav/atom</code> command	2239
3.129	compute <code>snap</code> command	2239
3.130	compute <code>sna/grid</code> command	2239
3.131	compute <code>sna/grid/local</code> command	2239
3.131.1	Syntax	2239
3.131.2	Examples	2241
3.131.3	Description	2241
3.131.4	Output info	2245
3.131.5	Restrictions	2247
3.131.6	Related commands	2247
3.131.7	Default	2247
3.132	compute <code>sph/e/atom</code> command	2247
3.132.1	Syntax	2247
3.132.2	Examples	2247
3.132.3	Description	2248
3.132.4	Output info	2248
3.132.5	Restrictions	2248
3.132.6	Related commands	2248
3.132.7	Default	2248
3.133	compute <code>sph/rho/atom</code> command	2248
3.133.1	Syntax	2248
3.133.2	Examples	2248
3.133.3	Description	2249
3.133.4	Output info	2249
3.133.5	Restrictions	2249

	3.133.6	Related commands	2249
	3.133.7	Default	2249
3.134		compute sph/t/atom command	2249
	3.134.1	Syntax	2249
	3.134.2	Examples	2249
	3.134.3	Description	2250
	3.134.4	Output info	2250
	3.134.5	Restrictions	2250
	3.134.6	Related commands	2250
	3.134.7	Default	2250
3.135		compute spin command	2250
	3.135.1	Syntax	2250
	3.135.2	Examples	2250
	3.135.3	Description	2251
	3.135.4	Output info	2251
	3.135.5	Restrictions	2251
	3.135.6	Default	2251
3.136		compute stress/atom command	2251
3.137		compute centroid/stress/atom command	2251
	3.137.1	Syntax	2251
	3.137.2	Examples	2252
	3.137.3	Description	2252
	3.137.4	Output info	2254
	3.137.5	Restrictions	2255
	3.137.6	Related commands	2255
	3.137.7	Default	2255
3.138		compute stress/cartesian command	2255
	3.138.1	Syntax	2255
	3.138.2	Examples	2255
	3.138.3	Description	2256
	3.138.4	Output info	2256
	3.138.5	Restrictions	2256
	3.138.6	Related commands	2256
3.139		compute stress/cylinder command	2257
3.140		compute stress/spherical command	2257
	3.140.1	Syntax	2257
	3.140.2	Examples	2257
	3.140.3	Description	2257
	3.140.4	Output info	2257
	3.140.5	Restrictions	2258
	3.140.6	Related commands	2258
	3.140.7	Default	2258
3.141		compute stress/mop command	2258
3.142		compute stress/mop/profile command	2258
	3.142.1	Syntax	2258
	3.142.2	Examples	2259
	3.142.3	Description	2259
	3.142.4	Output info	2259
	3.142.5	Restrictions	2260
	3.142.6	Related commands	2260
	3.142.7	Default	2260
3.143		compute force/tally command	2260
3.144		compute heat/flux/tally command	2260
3.145		compute heat/flux/virial/tally command	2260

3.146	compute pe/tally command	2260
3.147	compute pe/mol/tally command	2260
3.148	compute stress/tally command	2260
	3.148.1 Syntax	2260
	3.148.2 Examples	2261
	3.148.3 Description	2261
	3.148.4 Output info	2262
	3.148.5 Restrictions	2263
	3.148.6 Related commands	2263
	3.148.7 Default	2263
3.149	compute tdpd/cc/atom command	2263
	3.149.1 Syntax	2263
	3.149.2 Examples	2263
	3.149.3 Description	2263
	3.149.4 Output info	2263
	3.149.5 Restrictions	2264
	3.149.6 Related commands	2264
	3.149.7 Default	2264
3.150	compute temp command	2264
	3.150.1 Syntax	2264
	3.150.2 Examples	2264
	3.150.3 Description	2264
	3.150.4 Output info	2265
	3.150.5 Restrictions	2265
	3.150.6 Related commands	2265
	3.150.7 Default	2265
3.151	compute temp/asphere command	2265
	3.151.1 Syntax	2265
	3.151.2 Examples	2266
	3.151.3 Description	2266
	3.151.4 Output info	2267
	3.151.5 Restrictions	2267
	3.151.6 Related commands	2268
	3.151.7 Default	2268
3.152	compute temp/body command	2268
	3.152.1 Syntax	2268
	3.152.2 Examples	2268
	3.152.3 Description	2268
	3.152.4 Output info	2269
	3.152.5 Restrictions	2269
	3.152.6 Related commands	2269
	3.152.7 Default	2270
3.153	compute temp/chunk command	2270
	3.153.1 Syntax	2270
	3.153.2 Examples	2270
	3.153.3 Description	2270
	3.153.4 Output info	2273
	3.153.5 Restrictions	2273
	3.153.6 Related commands	2273
	3.153.7 Default	2273
3.154	compute temp/com command	2273
	3.154.1 Syntax	2273
	3.154.2 Examples	2273
	3.154.3 Description	2273

3.154.4	Output info	2274
3.154.5	Restrictions	2274
3.154.6	Related commands	2274
3.154.7	Default	2275
3.155	compute temp/cs command	2275
3.155.1	Syntax	2275
3.155.2	Examples	2275
3.155.3	Description	2275
3.155.4	Output info	2276
3.155.5	Restrictions	2276
3.155.6	Related commands	2276
3.155.7	Default	2276
3.156	compute temp/deform command	2276
3.156.1	Syntax	2276
3.156.2	Examples	2277
3.156.3	Description	2277
3.156.4	Output info	2279
3.156.5	Restrictions	2279
3.156.6	Related commands	2279
3.156.7	Default	2279
3.157	compute temp/deform/eff command	2279
3.157.1	Syntax	2279
3.157.2	Examples	2279
3.157.3	Description	2280
3.157.4	Output info	2280
3.157.5	Restrictions	2280
3.157.6	Related commands	2280
3.157.7	Default	2280
3.158	compute temp/drude command	2280
3.158.1	Syntax	2280
3.158.2	Examples	2281
3.158.3	Description	2281
3.158.4	Output info	2281
3.158.5	Restrictions	2281
3.158.6	Related commands	2281
3.158.7	Default	2282
3.159	compute temp/eff command	2282
3.159.1	Syntax	2282
3.159.2	Examples	2282
3.159.3	Description	2282
3.159.4	Output info	2283
3.159.5	Restrictions	2283
3.159.6	Related commands	2283
3.159.7	Default	2283
3.160	compute temp/partial command	2283
3.160.1	Syntax	2283
3.160.2	Examples	2283
3.160.3	Description	2283
3.160.4	Output info	2284
3.160.5	Restrictions	2284
3.160.6	Related commands	2284
3.160.7	Default	2284
3.161	compute temp/profile command	2284
3.161.1	Syntax	2284

3.161.2	Examples	2285
3.161.3	Description	2285
3.161.4	Output info	2286
3.161.5	Restrictions	2287
3.161.6	Related commands	2287
3.161.7	Default	2287
3.162	compute temp/ramp command	2287
3.162.1	Syntax	2287
3.162.2	Examples	2287
3.162.3	Description	2287
3.162.4	Output info	2288
3.162.5	Restrictions	2288
3.162.6	Related commands	2288
3.162.7	Default	2288
3.163	compute temp/region command	2289
3.163.1	Syntax	2289
3.163.2	Examples	2289
3.163.3	Description	2289
3.163.4	Output info	2290
3.163.5	Restrictions	2290
3.163.6	Related commands	2290
3.163.7	Default	2290
3.164	compute temp/region/eff command	2290
3.164.1	Syntax	2290
3.164.2	Examples	2290
3.164.3	Description	2290
3.164.4	Output info	2290
3.164.5	Restrictions	2291
3.164.6	Related commands	2291
3.164.7	Default	2291
3.165	compute temp/rotate command	2291
3.165.1	Syntax	2291
3.165.2	Examples	2291
3.165.3	Description	2291
3.165.4	Output info	2292
3.165.5	Restrictions	2292
3.165.6	Related commands	2292
3.165.7	Default	2292
3.166	compute temp/sphere command	2292
3.166.1	Syntax	2292
3.166.2	Examples	2293
3.166.3	Description	2293
3.166.4	Output info	2294
3.166.5	Restrictions	2294
3.166.6	Related commands	2294
3.166.7	Default	2294
3.167	compute temp/uef command	2294
3.167.1	Syntax	2294
3.167.2	Examples	2295
3.167.3	Description	2295
3.167.4	Restrictions	2295
3.167.5	Related commands	2295
3.167.6	Default	2295
3.168	compute ti command	2295

3.168.1	Syntax	2295
3.168.2	Examples	2296
3.168.3	Description	2296
3.168.4	Output info	2296
3.168.5	Restrictions	2297
3.168.6	Related commands	2297
3.168.7	Default	2297
3.169	compute torque/chunk command	2297
3.169.1	Syntax	2297
3.169.2	Examples	2297
3.169.3	Description	2297
3.169.4	Output info	2298
3.169.5	Restrictions	2298
3.169.6	Related commands	2298
3.169.7	Default	2298
3.170	compute vacf command	2298
3.170.1	Syntax	2298
3.170.2	Examples	2298
3.170.3	Description	2299
3.170.4	Output info	2299
3.170.5	Restrictions	2299
3.170.6	Related commands	2299
3.170.7	Default	2299
3.171	compute vacf/chunk command	2299
3.171.1	Syntax	2299
3.171.2	Examples	2300
3.171.3	Description	2300
3.171.4	Output info	2301
3.171.5	Restrictions	2301
3.171.6	Related commands	2301
3.171.7	Default	2301
3.172	compute vcm/chunk command	2301
3.172.1	Syntax	2301
3.172.2	Examples	2301
3.172.3	Description	2301
3.172.4	Output info	2302
3.172.5	Restrictions	2302
3.172.6	Related commands	2302
3.172.7	Default	2302
3.173	compute viscosity/cos command	2302
3.173.1	Syntax	2302
3.173.2	Examples	2302
3.173.3	Description	2303
3.173.4	Output info	2304
3.173.5	Restrictions	2304
3.173.6	Related commands	2304
3.173.7	Default	2304
3.174	compute voronoi/atom command	2304
3.174.1	Syntax	2304
3.174.2	Examples	2305
3.174.3	Description	2305
3.174.4	Output info	2306
3.174.5	Restrictions	2307
3.174.6	Related commands	2307

3.174.7	Default	2307
3.175	compute xrd command	2307
3.175.1	Syntax	2307
3.175.2	Examples	2308
3.175.3	Description	2308
3.175.4	Output info	2310
3.175.5	Restrictions	2310
3.175.6	Related commands	2310
3.175.7	Default	2310
4	Pair Styles	2311
4.1	pair_style adp command	2311
4.1.1	Syntax	2311
4.1.2	Examples	2311
4.1.3	Description	2311
4.1.4	Mixing, shift, table, tail correction, restart, rRESPA info	2313
4.1.5	Restrictions	2313
4.1.6	Related commands	2313
4.1.7	Default	2313
4.2	pair_style agni command	2313
4.2.1	Syntax	2313
4.2.2	Examples	2314
4.2.3	Description	2314
4.2.4	Mixing, shift, table, tail correction, restart, rRESPA info	2315
4.2.5	Restrictions	2315
4.2.6	Related commands	2315
4.2.7	Default	2315
4.3	pair_style aip/water/2dm command	2315
4.3.1	Syntax	2315
4.3.2	Examples	2315
4.3.3	Description	2316
4.3.4	Mixing, shift, table, tail correction, restart, rRESPA info	2317
4.3.5	Restrictions	2317
4.3.6	Related commands	2318
4.3.7	Default	2318
4.4	pair_style airebo command	2318
4.5	pair_style airebo/morse command	2318
4.6	pair_style airebo/bc command	2318
4.7	pair_style rebo command	2318
4.7.1	Syntax	2318
4.7.2	Examples	2318
4.7.3	Description	2319
4.7.4	Mixing, shift, table, tail correction, restart, rRESPA info	2321
4.7.5	Restrictions	2321
4.7.6	Related commands	2322
4.7.7	Default	2322
4.8	pair_style amoeba command	2322
4.9	pair_style hippo command	2322
4.9.1	Syntax	2322
4.9.2	Examples	2322
4.9.3	Additional info	2322
4.9.4	Description	2323
4.9.5	Mixing, shift, table, tail correction, restart, rRESPA info	2324
4.9.6	Restrictions	2325

	4.9.7	Related commands	2326
	4.9.8	Default	2326
4.10	pair_style	atm command	2326
	4.10.1	Syntax	2326
	4.10.2	Examples	2326
	4.10.3	Description	2326
	4.10.4	Mixing, shift, table, tail correction, restart, rRESPA info	2328
	4.10.5	Restrictions	2328
	4.10.6	Related commands	2328
	4.10.7	Default	2329
4.11	pair_style	beck command	2329
	4.11.1	Syntax	2329
	4.11.2	Examples	2329
	4.11.3	Description	2329
	4.11.4	Mixing, shift, table, tail correction, restart, rRESPA info	2330
	4.11.5	Restrictions	2330
	4.11.6	Related commands	2330
	4.11.7	Default	2330
4.12	pair_style	body/nparticle command	2330
	4.12.1	Syntax	2330
	4.12.2	Examples	2330
	4.12.3	Description	2331
	4.12.4	Mixing, shift, table, tail correction, restart, rRESPA info	2332
	4.12.5	Restrictions	2332
	4.12.6	Related commands	2332
	4.12.7	Default	2332
4.13	pair_style	body/rounded/polygon command	2332
	4.13.1	Syntax	2332
	4.13.2	Examples	2332
	4.13.3	Description	2333
	4.13.4	Mixing, shift, table, tail correction, restart, rRESPA info	2335
	4.13.5	Restrictions	2335
	4.13.6	Related commands	2335
	4.13.7	Default	2335
4.14	pair_style	body/rounded/polyhedron command	2335
	4.14.1	Syntax	2335
	4.14.2	Examples	2336
	4.14.3	Description	2336
	4.14.4	Mixing, shift, table, tail correction, restart, rRESPA info	2338
	4.14.5	Restrictions	2338
	4.14.6	Related commands	2338
	4.14.7	Default	2338
4.15	pair_style	bondval command	2338
4.16	pair_style	bondval/vec command	2338
	4.16.1	Syntax	2338
	4.16.2	Examples	2339
	4.16.3	Description	2339
	4.16.4	Mixing, shift, table, tail correction, restart, rRESPA info	2341
	4.16.5	Restrictions	2341
	4.16.6	Related commands	2341
	4.16.7	Default	2341
4.17	pair_style	bop command	2342
	4.17.1	Syntax	2342
	4.17.2	Examples	2342

4.17.3	Description	2342
4.17.4	Mixing, shift, table, tail correction, restart, rRESPA info	2347
4.17.5	Restrictions	2347
4.17.6	Related commands	2347
4.17.7	Default	2347
4.18	pair_style born command	2347
4.19	pair_style born/coul/long command	2347
4.20	pair_style born/coul/msm command	2348
4.21	pair_style born/coul/wolf command	2348
4.22	pair_style born/coul/dsf command	2348
4.22.1	Syntax	2348
4.22.2	Examples	2348
4.22.3	Description	2349
4.22.4	Mixing, shift, table, tail correction, restart, rRESPA info	2350
4.22.5	Restrictions	2350
4.22.6	Related commands	2350
4.22.7	Default	2350
4.23	pair_style born/gauss command	2350
4.23.1	Syntax	2351
4.23.2	Examples	2351
4.23.3	Description	2351
4.23.4	Mixing, shift, table, tail correction, restart, rRESPA info	2352
4.23.5	Restrictions	2352
4.23.6	Related commands	2352
4.23.7	Default	2352
4.24	pair_style bpm/spring command	2352
4.24.1	Syntax	2352
4.24.2	Examples	2352
4.24.3	Description	2353
4.24.4	Mixing, shift, table, tail correction, restart, rRESPA info	2353
4.24.5	Restrictions	2354
4.24.6	Related commands	2354
4.24.7	Default	2354
4.25	pair_style brownian command	2354
4.26	pair_style brownian/poly command	2354
4.26.1	Syntax	2354
4.26.2	Examples	2354
4.26.3	Description	2355
4.26.4	Mixing, shift, table, tail correction, restart, rRESPA info	2355
4.26.5	Restrictions	2356
4.26.6	Related commands	2356
4.26.7	Default	2356
4.27	pair_style buck command	2356
4.28	pair_style buck/coul/cut command	2356
4.29	pair_style buck/coul/long command	2356
4.30	pair_style buck/coul/msm command	2356
4.30.1	Syntax	2356
4.30.2	Examples	2357
4.30.3	Description	2357
4.30.4	Mixing, shift, table, tail correction, restart, rRESPA info	2358
4.30.5	Restrictions	2359
4.30.6	Related commands	2359
4.30.7	Default	2359
4.31	pair_style buck6d/coul/gauss/dsf command	2359

4.32	pair_style buck6d/coul/gauss/long command	2359
4.32.1	Syntax	2359
4.32.2	Examples	2359
4.32.3	Description	2359
4.32.4	Mixing, shift, table, tail correction, restart, rRESPA info	2361
4.32.5	Restrictions	2361
4.32.6	Related commands	2361
4.32.7	Default	2361
4.33	pair_style buck/long/coul/long command	2361
4.33.1	Syntax	2361
4.33.2	Examples	2361
4.33.3	Description	2362
4.33.4	Mixing, shift, table, tail correction, restart, rRESPA info	2363
4.33.5	Restrictions	2363
4.33.6	Related commands	2363
4.33.7	Default	2363
4.34	pair_style lj/charmm/coul/charmm command	2363
4.35	pair_style lj/charmm/coul/charmm/implicit command	2363
4.36	pair_style lj/charmm/coul/long command	2364
4.37	pair_style lj/charmm/coul/msm command	2364
4.38	pair_style lj/charmmfsw/coul/charmmfsh command	2364
4.39	pair_style lj/charmmfsw/coul/long command	2364
4.39.1	Syntax	2364
4.39.2	Examples	2365
4.39.3	Description	2365
4.39.4	Mixing, shift, table, tail correction, restart, rRESPA info	2367
4.39.5	Restrictions	2367
4.39.6	Related commands	2367
4.39.7	Default	2367
4.40	pair_style lj/class2 command	2367
4.41	pair_style lj/class2/coul/cut command	2367
4.42	pair_style lj/class2/coul/long command	2368
4.42.1	Syntax	2368
4.42.2	Examples	2368
4.42.3	Description	2368
4.42.4	Mixing, shift, table, tail correction, restart, rRESPA info	2369
4.42.5	Restrictions	2370
4.42.6	Related commands	2370
4.42.7	Default	2370
4.43	pair_style colloid command	2370
4.43.1	Syntax	2370
4.43.2	Examples	2370
4.43.3	Description	2371
4.43.4	Mixing, shift, table, tail correction, restart, rRESPA info	2372
4.43.5	Restrictions	2373
4.43.6	Related commands	2373
4.43.7	Default	2373
4.44	pair_style comb command	2373
4.45	pair_style comb3 command	2373
4.45.1	Syntax	2373
4.45.2	Examples	2373
4.45.3	Description	2374
4.45.4	Mixing, shift, table, tail correction, restart, rRESPA info	2375
4.45.5	Restrictions	2376

	4.45.6	Related commands	2376
	4.45.7	Default	2376
4.46	pair_style	cosine/squared command	2376
	4.46.1	Syntax	2376
	4.46.2	Examples	2377
	4.46.3	Description	2377
	4.46.4	Mixing, shift, table, tail correction, restart, rRESPA info	2378
	4.46.5	Restrictions	2378
	4.46.6	Related commands	2378
	4.46.7	Default	2378
4.47	pair_style	coul/cut command	2378
4.48	pair_style	coul/cut/global command	2378
4.49	pair_style	coul/ctip command	2379
4.50	pair_style	coul/debye command	2379
4.51	pair_style	coul/dsf command	2379
4.52	pair_style	coul/exclude command	2379
4.53	pair_style	coul/long command	2379
4.54	pair_style	coul/msm command	2379
4.55	pair_style	coul/streitz command	2379
4.56	pair_style	coul/wolf command	2379
4.57	pair_style	tip4p/cut command	2379
4.58	pair_style	tip4p/long command	2379
	4.58.1	Syntax	2379
	4.58.2	Examples	2380
	4.58.3	Description	2381
	4.58.4	Mixing, shift, table, tail correction, restart, rRESPA info	2384
	4.58.5	Restrictions	2385
	4.58.6	Related commands	2385
	4.58.7	Default	2385
4.59	pair_style	coul/diel command	2385
	4.59.1	Syntax	2385
	4.59.2	Examples	2385
	4.59.3	Description	2385
	4.59.4	Mixing, shift, table, tail correction, restart, rRESPA info	2386
	4.59.5	Restrictions	2386
	4.59.6	Related commands	2386
	4.59.7	Default	2387
4.60	pair_style	coul/shield command	2387
	4.60.1	Syntax	2387
	4.60.2	Examples	2387
	4.60.3	Description	2387
	4.60.4	Mixing, shift, table, tail correction, restart, rRESPA info	2388
	4.60.5	Restrictions	2388
	4.60.6	Related commands	2388
	4.60.7	Default	2388
4.61	pair_style	coul/slatter command	2388
4.62	pair_style	coul/slatter/cut command	2388
4.63	pair_style	coul/slatter/long command	2389
	4.63.1	Syntax	2389
	4.63.2	Examples	2389
	4.63.3	Description	2389
	4.63.4	Mixing, shift, table, tail correction, restart, rRESPA info	2390
	4.63.5	Restrictions	2390
	4.63.6	Related commands	2390

	4.63.7	Default	2390
4.64	pair_style coul/tt command		2390
	4.64.1	Syntax	2390
	4.64.2	Examples	2391
	4.64.3	Description	2391
	4.64.4	Mixing, shift, table, tail correction, restart, rRESPA info	2391
	4.64.5	Restrictions	2392
	4.64.6	Related commands	2392
	4.64.7	Default	2392
4.65	pair_style born/coul/dsf/cs command		2392
4.66	pair_style born/coul/long/cs command		2392
4.67	pair_style born/coul/wolf/cs command		2392
4.68	pair_style buck/coul/long/cs command		2392
4.69	pair_style coul/long/cs command		2392
4.70	pair_style coul/wolf/cs command		2392
4.71	pair_style lj/cut/coul/long/cs command		2392
4.72	pair_style lj/class2/coul/long/cs command		2393
	4.72.1	Syntax	2393
	4.72.2	Examples	2393
	4.72.3	Description	2394
	4.72.4	Mixing, shift, table, tail correction, restart, rRESPA info	2395
	4.72.5	Restrictions	2395
	4.72.6	Related commands	2395
	4.72.7	Default	2395
4.73	pair_style coul/cut/dielectric command		2395
4.74	pair_style coul/long/dielectric command		2395
4.75	pair_style lj/cut/coul/cut/dielectric command		2395
4.76	pair_style lj/cut/coul/debye/dielectric command		2395
4.77	pair_style lj/cut/coul/long/dielectric command		2395
4.78	pair_style lj/cut/coul/msm/dielectric command		2396
4.79	pair_style lj/long/coul/long/dielectric command		2396
	4.79.1	Syntax	2396
	4.79.2	Examples	2396
	4.79.3	Description	2396
	4.79.4	Mixing, shift, table, tail correction, restart, rRESPA info	2397
	4.79.5	Restrictions	2397
	4.79.6	Related commands	2397
	4.79.7	Default	2397
4.80	pair_style lj/cut/dipole/cut command		2397
4.81	pair_style lj/sf/dipole/sf command		2397
4.82	pair_style lj/cut/dipole/long command		2397
4.83	pair_style lj/long/dipole/long command		2397
	4.83.1	Syntax	2397
	4.83.2	Examples	2398
	4.83.3	Description	2398
	4.83.4	Mixing, shift, table, tail correction, restart, rRESPA info	2402
	4.83.5	Restrictions	2402
	4.83.6	Related commands	2403
	4.83.7	Default	2403
4.84	pair_style dispersion/d3 command		2403
	4.84.1	Syntax	2403
	4.84.2	Examples	2403
	4.84.3	Description	2403
	4.84.4	Coefficients	2404

	4.84.5	Mixing, shift, table, tail correction, restart, rRESPA info	2404
	4.84.6	Restrictions	2405
	4.84.7	Related commands	2405
	4.84.8	Default	2405
4.85	pair_style dpd	command	2405
4.86	pair_style dpd/tstat	command	2405
	4.86.1	Syntax	2405
	4.86.2	Examples	2405
	4.86.3	Description	2406
	4.86.4	Mixing, shift, table, tail correction, restart, rRESPA info	2407
	4.86.5	Restrictions	2408
	4.86.6	Related commands	2408
	4.86.7	Default	2408
4.87	pair_style dpd/coul/slater/long	command	2408
	4.87.1	Syntax	2408
	4.87.2	Examples	2408
	4.87.3	Description	2409
	4.87.4	Mixing, shift, table, tail correction, restart, rRESPA info	2410
	4.87.5	Restrictions	2410
	4.87.6	Related commands	2411
	4.87.7	Default	2411
4.88	pair_style dpd/ext	command	2411
4.89	pair_style dpd/ext/tstat	command	2411
	4.89.1	Syntax	2411
	4.89.2	Examples	2411
	4.89.3	Description	2411
	4.89.4	Restrictions	2414
	4.89.5	Related commands	2414
4.90	pair_style dpd/fdt	command	2414
4.91	pair_style dpd/fdt/energy	command	2414
	4.91.1	Syntax	2414
	4.91.2	Examples	2414
	4.91.3	Description	2415
	4.91.4	Restrictions	2416
	4.91.5	Related commands	2416
	4.91.6	Default	2416
4.92	pair_style drip	command	2417
	4.92.1	Syntax	2417
	4.92.2	Examples	2417
	4.92.3	Description	2417
	4.92.4	Mixing, shift, table, tail correction, restart, rRESPA info	2418
	4.92.5	Restrictions	2418
	4.92.6	Related commands	2419
4.93	pair_style dsmc	command	2419
	4.93.1	Syntax	2419
	4.93.2	Examples	2419
	4.93.3	Description	2419
	4.93.4	Mixing, shift, table, tail correction, restart, rRESPA info	2420
	4.93.5	Restrictions	2420
	4.93.6	Related commands	2420
	4.93.7	Default	2421
4.94	pair_style e3b	command	2421
	4.94.1	Syntax	2421
	4.94.2	Examples	2421

4.94.3	Description	2422
4.94.4	Mixing, shift, table, tail correction, restart, rRESPA info	2423
4.94.5	Restrictions	2423
4.94.6	Related commands	2423
4.94.7	Default	2424
4.95	pair_style eam command	2424
4.96	pair_style eam/alloy command	2424
4.97	pair_style eam/cd command	2424
4.98	pair_style eam/cd/old command	2424
4.99	pair_style eam/fs command	2424
4.100	pair_style eam/he command	2424
4.100.1	Syntax	2424
4.100.2	Examples	2424
4.100.3	Description	2425
4.100.4	Mixing, shift, table, tail correction, restart, rRESPA info	2430
4.100.5	Restrictions	2430
4.100.6	Related commands	2430
4.100.7	Default	2430
4.101	pair_style eam/apip command	2431
4.102	pair_style eam/fs/apip command	2431
4.102.1	Syntax	2431
4.102.2	Examples	2431
4.102.3	Description	2431
4.102.4	Mixing, shift, table, tail correction, restart, rRESPA info	2431
4.102.5	Restrictions	2432
4.102.6	Related commands	2432
4.102.7	Default	2432
4.103	pair_style edip command	2432
4.104	pair_style edip/multi command	2432
4.104.1	Syntax	2432
4.104.2	Examples	2432
4.104.3	Description	2432
4.104.4	Mixing, shift, table, tail correction, restart, rRESPA info	2434
4.104.5	Restrictions	2435
4.104.6	Related commands	2435
4.104.7	Default	2435
4.105	pair_style eff/cut command	2435
4.105.1	Syntax	2435
4.105.2	Examples	2435
4.105.3	Description	2435
4.105.4	Mixing, shift, table, tail correction, restart, rRESPA info	2438
4.105.5	Restrictions	2438
4.105.6	Related commands	2439
4.105.7	Default	2439
4.106	pair_style eim command	2439
4.106.1	Syntax	2439
4.106.2	Examples	2439
4.106.3	Description	2439
4.106.4	Restrictions	2441
4.106.5	Related commands	2441
4.106.6	Default	2441
4.107	pair_style exp6/rx command	2441
4.107.1	Syntax	2442
4.107.2	Examples	2442

4.107.3	Description	2442
4.107.4	Mixing, shift, table, tail correction, restart, rRESPA info	2444
4.107.5	Restrictions	2444
4.107.6	Related commands	2444
4.107.7	Default	2444
4.108	pair_style extep command	2444
4.108.1	Syntax	2444
4.108.2	Examples	2444
4.108.3	Description	2445
4.108.4	Restrictions	2445
4.108.5	Related commands	2445
4.108.6	Default	2445
4.109	pair_style lj/cut/soft command	2445
4.110	pair_style lj/cut/soft/gapsys command	2445
4.111	pair_style lj/cut/coul/cut/soft command	2445
4.112	pair_style lj/cut/coul/long/soft command	2445
4.113	pair_style lj/cut/tip4p/long/soft command	2445
4.114	pair_style lj/charmm/coul/long/soft command	2446
4.115	pair_style lj/class2/soft command	2446
4.116	pair_style lj/class2/coul/cut/soft command	2446
4.117	pair_style lj/class2/coul/long/soft command	2446
4.118	pair_style coul/cut/soft command	2446
4.119	pair_style coul/cut/soft/gapsys command	2446
4.120	pair_style coul/long/soft command	2446
4.121	pair_style tip4p/long/soft command	2446
4.122	pair_style morse/soft command	2446
4.122.1	Syntax	2446
4.122.2	Examples	2448
4.122.3	Description	2449
4.122.4	Mixing, shift, table, tail correction, restart, rRESPA info	2453
4.122.5	Restrictions	2454
4.122.6	Related commands	2454
4.122.7	Default	2454
4.123	pair_style gauss command	2454
4.124	pair_style gauss/cut command	2454
4.124.1	Syntax	2454
4.124.2	Examples	2454
4.124.3	Description	2455
4.124.4	Mixing, shift, table, tail correction, restart, rRESPA info	2456
4.124.5	Restrictions	2456
4.124.6	Related commands	2457
4.124.7	Default	2457
4.125	pair_style gayberne command	2457
4.125.1	Syntax	2457
4.125.2	Examples	2457
4.125.3	Description	2457
4.125.4	Mixing, shift, table, tail correction, restart, rRESPA info	2459
4.125.5	Restrictions	2459
4.125.6	Related commands	2459
4.125.7	Default	2460
4.126	pair_style gran/hooke command	2460
4.127	pair_style gran/hooke/history command	2460
4.128	pair_style gran/hertz/history command	2460
4.128.1	Syntax	2460

4.128.2	Examples	2461
4.128.3	Description	2461
4.128.4	Mixing, shift, table, tail correction, restart, rRESPA info	2463
4.128.5	Restrictions	2463
4.128.6	Related commands	2464
4.128.7	Default	2464
4.129	pair_style granular command	2464
4.129.1	Syntax	2464
4.129.2	Examples	2464
4.129.3	Description	2465
4.129.4	Mixing, shift, table, tail correction, restart, rRESPA info	2475
4.129.5	Restrictions	2476
4.129.6	Related commands	2476
4.129.7	Default	2477
4.129.8	References	2477
4.130	pair_style granular/superellipsoid command	2478
4.130.1	Syntax	2478
4.130.2	Examples	2478
4.130.3	Description	2478
4.130.4	Mixing, shift, table, tail correction, restart, rRESPA info	2483
4.130.5	Restrictions	2483
4.130.6	Related commands	2484
4.130.7	Default	2484
4.130.8	References	2484
4.131	pair_style lj/gromacs command	2484
4.132	pair_style lj/gromacs/coul/gromacs command	2484
4.132.1	Syntax	2484
4.132.2	Examples	2485
4.132.3	Description	2485
4.132.4	Mixing, shift, table, tail correction, restart, rRESPA info	2486
4.132.5	Restrictions	2486
4.132.6	Related commands	2486
4.132.7	Default	2486
4.133	pair_style gw command	2487
4.134	pair_style gw/zbl command	2487
4.134.1	Syntax	2487
4.134.2	Examples	2487
4.134.3	Description	2487
4.134.4	Mixing, shift, table, tail correction, restart, rRESPA info	2488
4.134.5	Restrictions	2488
4.134.6	Related commands	2488
4.134.7	Default	2488
4.135	pair_style harmonic/cut command	2488
4.135.1	Syntax	2489
4.135.2	Examples	2489
4.135.3	Description	2489
4.135.4	Mixing, shift, table, tail correction, restart, rRESPA info	2489
4.135.5	Restrictions	2490
4.135.6	Related commands	2490
4.135.7	Default	2490
4.136	pair_style hbond/dreiding/lj command	2490
4.137	pair_style hbond/dreiding/lj/angleoffset command	2490
4.138	pair_style hbond/dreiding/morse command	2490
4.139	pair_style hbond/dreiding/morse/angleoffset command	2490

4.139.1	Syntax	2490
4.139.2	Examples	2490
4.139.3	Description	2491
4.139.4	Mixing, shift, table, tail correction, restart, rRESPA info	2494
4.139.5	Restrictions	2494
4.139.6	Related commands	2494
4.139.7	Default	2494
4.140	pair_style hdnnp command	2495
4.140.1	Syntax	2495
4.140.2	Examples	2495
4.140.3	Description	2495
4.140.4	Mixing, shift, table, tail correction, restart, rRESPA info	2497
4.140.5	Restrictions	2497
4.141	pair_style hybrid command	2498
4.142	pair_style hybrid/molecular command	2498
4.143	pair_style hybrid/overlay command	2498
4.144	pair_style hybrid/scaled command	2498
4.144.1	Syntax	2498
4.144.2	Examples	2498
4.144.3	Description	2499
4.144.4	Mixing, shift, table, tail correction, restart, rRESPA info	2504
4.144.5	Restrictions	2505
4.144.6	Related commands	2505
4.144.7	Default	2505
4.145	pair_style ilp/graphene/hbn command	2505
4.145.1	Syntax	2505
4.145.2	Examples	2505
4.145.3	Description	2506
4.145.4	Mixing, shift, table, tail correction, restart, rRESPA info	2507
4.145.5	Restrictions	2507
4.145.6	Related commands	2507
4.145.7	Default	2508
4.146	pair_style ilp/tmd command	2508
4.146.1	Syntax	2508
4.146.2	Examples	2508
4.146.3	Description	2508
4.146.4	Mixing, shift, table, tail correction, restart, rRESPA info	2510
4.146.5	Restrictions	2510
4.146.6	Related commands	2510
4.146.7	Default	2510
4.147	pair_style kim command	2511
4.147.1	Syntax	2511
4.147.2	Examples	2511
4.147.3	Description	2511
4.147.4	Mixing, shift, table, tail correction, restart, rRESPA info	2512
4.147.5	Restrictions	2512
4.147.6	Related commands	2512
4.147.7	Default	2512
4.148	pair_style kolmogorov/crespi/full command	2512
4.148.1	Syntax	2512
4.148.2	Examples	2512
4.148.3	Description	2513
4.148.4	Mixing, shift, table, tail correction, restart, rRESPA info	2514
4.148.5	Restrictions	2514

	4.148.6	Related commands	2514
	4.148.7	Default	2514
4.149	pair_style kolmogorov/crespi/z command		2514
	4.149.1	Syntax	2514
	4.149.2	Examples	2514
	4.149.3	Description	2515
	4.149.4	Restrictions	2515
	4.149.5	Related commands	2515
	4.149.6	Default	2515
4.150	pair_style lambda/input/apip command		2516
4.151	pair_style lambda/input/csp/apip command		2516
	4.151.1	Syntax	2516
4.152	pair_style lambda/input/csp/apip command		2516
	4.152.1	Syntax	2516
	4.152.2	Examples	2516
	4.152.3	Description	2516
	4.152.4	Mixing, shift, table, tail correction, restart, rRESPA info	2517
	4.152.5	Restrictions	2517
	4.152.6	Related commands	2517
	4.152.7	Default	2517
4.153	pair_style lambda/zone/apip command		2517
	4.153.1	Syntax	2517
	4.153.2	Examples	2518
	4.153.3	Description	2518
	4.153.4	Mixing, shift, table, tail correction, restart, rRESPA info	2518
	4.153.5	Restrictions	2519
	4.153.6	Related commands	2519
	4.153.7	Default	2519
4.154	pair_style lcbop command		2519
	4.154.1	Syntax	2519
	4.154.2	Examples	2519
	4.154.3	Description	2519
	4.154.4	Mixing, shift, table, tail correction, restart, rRESPA info	2520
	4.154.5	Restrictions	2520
	4.154.6	Related commands	2520
	4.154.7	Default	2520
4.155	pair_style ldd command		2520
	4.155.1	Syntax	2520
	4.155.2	Examples	2521
	4.155.3	Description	2521
	4.155.4	Theory	2521
	4.155.5	Indicator functions	2522
	4.155.6	Potential and gradient functions	2522
	4.155.7	Accessing the local-density data	2523
	4.155.8	Mixing, shift, table, tail correction, restart, rRESPA info	2523
	4.155.9	Restrictions	2523
	4.155.10	Related commands	2524
4.156	pair_style lebedeva/z command		2524
	4.156.1	Syntax	2524
	4.156.2	Examples	2524
	4.156.3	Description	2524
	4.156.4	Restrictions	2525
	4.156.5	Related commands	2525
	4.156.6	Default	2525

4.157	pair_style	lepton command	2526
4.158	pair_style	lepton/coul command	2526
4.159	pair_style	lepton/sphere command	2526
4.159.1		Syntax	2526
4.159.2		Examples	2526
4.159.3		Description	2527
4.159.4		Lepton expression syntax and features	2528
4.159.5		Mixing, shift, table, tail correction, restart, rRESPA info	2529
4.159.6		Restrictions	2529
4.159.7		Related commands	2529
4.159.8		Default	2529
4.160	pair_style	line/lj command	2529
4.160.1		Syntax	2529
4.160.2		Examples	2530
4.160.3		Description	2530
4.160.4		Mixing, shift, table, tail correction, restart, rRESPA info	2531
4.160.5		Restrictions	2531
4.160.6		Related commands	2531
4.160.7		Default	2531
4.161	pair_style	list command	2532
4.161.1		Syntax	2532
4.161.2		Examples	2532
4.161.3		Description	2532
4.161.4		Mixing, shift, table, tail correction, restart, rRESPA info	2533
4.161.5		Restrictions	2534
4.161.6		Related commands	2534
4.161.7		Default	2534
4.162	pair_style	lj/cut command	2534
4.162.1		Syntax	2534
4.162.2		Examples	2534
4.162.3		Description	2534
4.162.4		Coefficients	2535
4.162.5		Mixing, shift, table, tail correction, restart, rRESPA info	2535
4.162.6		Related commands	2536
4.162.7		Default	2536
4.163	pair_style	lj96/cut command	2536
4.163.1		Syntax	2536
4.163.2		Examples	2536
4.163.3		Description	2536
4.163.4		Mixing, shift, table, tail correction, restart, rRESPA info	2537
4.163.5		Restrictions	2537
4.163.6		Related commands	2537
4.163.7		Default	2537
4.164	pair_style	lj/cubic command	2537
4.164.1		Syntax	2538
4.164.2		Examples	2538
4.164.3		Description	2538
4.164.4		Mixing, shift, table, tail correction, restart, rRESPA info	2539
4.164.5		Restrictions	2539
4.164.6		Related commands	2539
4.164.7		Default	2539
4.165	pair_style	lj/cut/coul/cut command	2539
4.166	pair_style	lj/cut/coul/debye command	2539
4.167	pair_style	lj/cut/coul/dsf command	2539

4.168	pair_style lj/cut/coul/long command	2539
4.169	pair_style lj/cut/coul/msm command	2540
4.170	pair_style lj/cut/coul/wolf command	2540
4.170.1	Syntax	2540
4.170.2	Examples	2540
4.170.3	Description	2541
4.170.4	Coefficients	2542
4.170.5	Mixing, shift, table, tail correction, restart, rRESPA info	2543
4.170.6	Restrictions	2543
4.170.7	Related commands	2543
4.170.8	Default	2543
4.171	pair_style lj/cut/sphere command	2543
4.171.1	Syntax	2544
4.171.2	Examples	2544
4.171.3	Description	2544
4.171.4	Coefficients	2545
4.171.5	Mixing, shift, table, tail correction, restart, rRESPA info	2546
4.171.6	Restrictions	2546
4.171.7	Related commands	2546
4.171.8	Default	2546
4.172	pair_style lj/cut/tip4p/cut command	2546
4.173	pair_style lj/cut/tip4p/long command	2546
4.173.1	Syntax	2546
4.173.2	Examples	2547
4.173.3	Description	2547
4.173.4	Coefficients	2548
4.173.5	Mixing, shift, table, tail correction, restart, rRESPA info	2549
4.173.6	Restrictions	2549
4.173.7	Related commands	2549
4.173.8	Default	2550
4.174	pair_style lj/expand command	2550
4.175	pair_style lj/expand/coul/long command	2550
4.175.1	Syntax	2550
4.175.2	Examples	2550
4.175.3	Description	2550
4.175.4	Mixing, shift, table, tail correction, restart, rRESPA info	2551
4.175.5	Restrictions	2551
4.175.6	Related commands	2551
4.175.7	Default	2551
4.176	pair_style lj/expand/sphere command	2551
4.176.1	Syntax	2552
4.176.2	Examples	2552
4.176.3	Description	2552
4.176.4	Coefficients	2553
4.176.5	Mixing, shift, table, tail correction, restart, rRESPA info	2554
4.176.6	Restrictions	2554
4.176.7	Related commands	2554
4.176.8	Default	2554
4.177	pair_style lj/long/coul/long command	2554
4.178	pair_style lj/long/tip4p/long command	2554
4.178.1	Syntax	2554
4.178.2	Examples	2555
4.178.3	Description	2555
4.178.4	Mixing, shift, table, tail correction, restart, rRESPA info	2557

	4.178.5	Restrictions	2557
	4.178.6	Related commands	2557
	4.178.7	Default	2558
4.179	pair_style lj/pirani	command	2558
	4.179.1	Syntax	2558
	4.179.2	Examples	2558
	4.179.3	Description	2558
	4.179.4	Mixing, shift, table, tail correction, restart, rRESPA info	2559
	4.179.5	Restrictions	2560
	4.179.6	Related commands	2560
	4.179.7	Default	2560
4.180	pair_style lj/relres	command	2560
	4.180.1	Syntax	2560
	4.180.2	Examples	2560
	4.180.3	Description	2560
	4.180.4	Mixing, shift, table, tail correction, restart, rRESPA info	2563
	4.180.5	Restrictions	2563
	4.180.6	Related commands	2564
	4.180.7	Default	2564
4.181	pair_style lj/smooth	command	2564
	4.181.1	Syntax	2564
	4.181.2	Examples	2564
	4.181.3	Description	2564
	4.181.4	Mixing, shift, table, tail correction, restart, rRESPA info	2565
	4.181.5	Restrictions	2565
	4.181.6	Related commands	2565
	4.181.7	Default	2566
4.182	pair_style lj/smooth/linear	command	2566
	4.182.1	Syntax	2566
	4.182.2	Examples	2566
	4.182.3	Description	2566
	4.182.4	Mixing, shift, table, tail correction, restart, rRESPA info	2567
	4.182.5	Restrictions	2567
	4.182.6	Related commands	2567
	4.182.7	Default	2567
4.183	pair_style lj/switch3/coulgauss/long	command	2567
4.184	pair_style mm3/switch3/coulgauss/long	command	2567
	4.184.1	Syntax	2568
	4.184.2	Examples	2568
	4.184.3	Description	2568
	4.184.4	Mixing, shift, table, tail correction, restart, rRESPA info	2569
	4.184.5	Restrictions	2569
	4.184.6	Related commands	2570
	4.184.7	Default	2570
4.185	pair_style local/density	command	2570
	4.185.1	Syntax	2570
	4.185.2	Examples	2570
	4.185.3	Description	2570
	4.185.4	Mixing, shift, table, tail correction, restart, rRESPA info	2573
	4.185.5	Restrictions	2573
	4.185.6	Related commands	2573
	4.185.7	Default	2573
4.186	pair_style lubricate	command	2573
4.187	pair_style lubricate/poly	command	2573

4.187.1	Syntax	2573
4.187.2	Examples	2574
4.187.3	Description	2574
4.187.4	Mixing, shift, table, tail correction, restart, rRESPA info	2576
4.187.5	Restrictions	2576
4.187.6	Related commands	2576
4.187.7	Default	2576
4.188	pair_style lubricateU command	2577
4.189	pair_style lubricateU/poly command	2577
4.189.1	Syntax	2577
4.189.2	Examples	2577
4.189.3	Description	2577
4.189.4	Mixing, shift, table, tail correction, restart, rRESPA info	2579
4.189.5	Restrictions	2579
4.189.6	Related commands	2579
4.189.7	Default	2579
4.190	pair_style mbx command	2580
4.190.1	Syntax	2580
4.190.2	Examples	2580
4.190.3	Description	2580
4.190.4	Pair coeff syntax	2581
4.190.5	Restrictions	2582
4.190.6	Related commands	2582
4.191	pair_style lj/mdf command	2582
4.192	pair_style buck/mdf command	2583
4.193	pair_style lennard/mdf command	2583
4.193.1	Syntax	2583
4.193.2	Examples	2583
4.193.3	Description	2583
4.193.4	Mixing, shift, table, tail correction, restart, rRESPA info	2585
4.193.5	Restrictions	2585
4.193.6	Related commands	2585
4.193.7	Default	2585
4.194	pair_style meam command	2585
4.195	pair_style meam/ms command	2585
4.195.1	Syntax	2586
4.195.2	Examples	2586
4.195.3	Description	2586
4.195.4	Mixing, shift, table, tail correction, restart, rRESPA info	2591
4.195.5	Restrictions	2591
4.195.6	Related commands	2591
4.195.7	Default	2592
4.196	pair_style meam/spline command	2592
4.196.1	Syntax	2592
4.196.2	Examples	2592
4.196.3	Description	2592
4.196.4	Mixing, shift, table, tail correction, restart, rRESPA info	2594
4.196.5	Restrictions	2594
4.196.6	Related commands	2594
4.196.7	Default	2594
4.197	pair_style meam/sw/spline command	2594
4.197.1	Syntax	2594
4.197.2	Examples	2594
4.197.3	Description	2594

4.197.4	Mixing, shift, table, tail correction, restart, rRESPA info	2596
4.197.5	Restrictions	2596
4.197.6	Related commands	2596
4.197.7	Default	2596
4.198	pair_style mesocnt command	2596
4.199	pair_style mesocnt/viscous command	2596
4.199.1	Syntax	2596
4.199.2	Examples	2597
4.199.3	Description	2597
4.199.4	Mixing, shift, table, tail correction, restart, rRESPA info	2599
4.199.5	Restrictions	2599
4.199.6	Related commands	2599
4.199.7	Default	2599
4.200	pair_style edpd command	2599
4.201	pair_style mdpd command	2599
4.202	pair_style mdpd/rhosum command	2600
4.203	pair_style tdpd command	2600
4.203.1	Syntax	2600
4.203.2	Examples	2600
4.203.3	Description	2600
4.203.4	Example scripts	2603
4.203.5	Mixing, shift, table, tail correction, restart, rRESPA info	2605
4.203.6	Restrictions	2605
4.203.7	Related commands	2605
4.203.8	Default	2605
4.204	pair_style mgpt command	2606
4.204.1	Syntax	2606
4.204.2	Examples	2606
4.204.3	Description	2606
4.204.4	Mixing, shift, table, tail correction, restart, rRESPA info	2607
4.204.5	Restrictions	2608
4.204.6	Related commands	2608
4.204.7	Default	2608
4.205	pair_style mie/cut command	2608
4.205.1	Syntax	2608
4.205.2	Examples	2608
4.205.3	Description	2609
4.205.4	Mixing, shift, table, tail correction, restart, rRESPA info	2609
4.205.5	Restrictions	2610
4.205.6	Related commands	2610
4.205.7	Default	2610
4.206	pair_style mliap command	2610
4.206.1	Syntax	2610
4.206.2	Examples	2610
4.206.3	Description	2611
4.206.4	Mixing, shift, table, tail correction, restart, rRESPA info	2613
4.206.5	Restrictions	2614
4.206.6	Related commands	2614
4.206.7	Default	2614
4.207	pair_style momb command	2614
4.207.1	Syntax	2614
4.207.2	Examples	2614
4.207.3	Description	2615
4.207.4	Restrictions	2615

	4.207.5	Related commands	2615
	4.207.6	Default	2615
4.208	pair_style	morse command	2616
4.209	pair_style	morse/smooth/linear command	2616
	4.209.1	Syntax	2616
	4.209.2	Examples	2616
	4.209.3	Description	2616
	4.209.4	Mixing, shift, table, tail correction, restart, rRESPA info	2617
	4.209.5	Restrictions	2617
	4.209.6	Related commands	2617
	4.209.7	Default	2617
4.210	pair_style	multi/lucy command	2618
	4.210.1	Syntax	2618
	4.210.2	Examples	2618
	4.210.3	Description	2618
	4.210.4	Mixing, shift, table, tail correction, restart, rRESPA info	2620
	4.210.5	Restrictions	2620
	4.210.6	Related commands	2620
	4.210.7	Default	2620
4.211	pair_style	multi/lucy/rx command	2620
	4.211.1	Syntax	2620
	4.211.2	Examples	2621
	4.211.3	Description	2621
	4.211.4	Mixing, shift, table, tail correction, restart, rRESPA info	2623
	4.211.5	Restrictions	2623
	4.211.6	Related commands	2623
	4.211.7	Default	2623
4.212	pair_style	nb3b/harmonic command	2624
4.213	pair_style	nb3b/screened command	2624
	4.213.1	Syntax	2624
	4.213.2	Examples	2624
	4.213.3	Description	2624
	4.213.4	Restrictions	2625
	4.213.5	Related commands	2625
	4.213.6	Default	2625
4.214	pair_style	nm/cut command	2625
4.215	pair_style	nm/cut/split command	2626
4.216	pair_style	nm/cut/coul/cut command	2626
4.217	pair_style	nm/cut/coul/long command	2626
	4.217.1	Syntax	2626
	4.217.2	Examples	2626
	4.217.3	Description	2627
	4.217.4	Mixing, shift, table, tail correction, restart, rRESPA info	2627
	4.217.5	Restrictions	2628
	4.217.6	Related commands	2628
	4.217.7	Default	2628
4.218	pair_style	none command	2628
	4.218.1	Syntax	2628
	4.218.2	Examples	2628
	4.218.3	Description	2629
	4.218.4	Restrictions	2629
	4.218.5	Related commands	2629
	4.218.6	Default	2629
4.219	pair_style	oxdna/excv command	2629

4.220	pair_style oxdna/stk command	2629
4.221	pair_style oxdna/hbond command	2629
4.222	pair_style oxdna/xstk command	2629
4.223	pair_style oxdna/coaxstk command	2629
4.223.1	Syntax	2629
4.223.2	Examples	2630
4.223.3	Description	2631
4.223.4	Potential file reading	2632
4.223.5	Unique base pairing	2633
4.223.6	Restrictions	2634
4.223.7	Related commands	2634
4.223.8	Default	2634
4.224	pair_style oxdna2/excv command	2634
4.225	pair_style oxdna2/stk command	2634
4.226	pair_style oxdna2/hbond command	2634
4.227	pair_style oxdna2/xstk command	2634
4.228	pair_style oxdna2/coaxstk command	2634
4.229	pair_style oxdna2/dh command	2634
4.229.1	Syntax	2634
4.229.2	Examples	2635
4.229.3	Description	2636
4.229.4	Potential file reading	2637
4.229.5	Unique base pairing	2638
4.229.6	Restrictions	2639
4.229.7	Related commands	2639
4.229.8	Default	2639
4.230	pair_style oxdna3/excv command	2640
4.231	pair_style oxdna3/stk command	2640
4.232	pair_style oxdna3/hbond command	2640
4.233	pair_style oxdna3/xstk command	2640
4.234	pair_style oxdna3/coaxstk command	2640
4.235	pair_style oxdna3/dh command	2640
4.235.1	Syntax	2640
4.235.2	Examples	2640
4.235.3	Description	2641
4.235.4	Unique base pairing	2642
4.235.5	Restrictions	2643
4.235.6	Related commands	2643
4.235.7	Default	2643
4.236	pair_style oxrna2/excv command	2644
4.237	pair_style oxrna2/stk command	2644
4.238	pair_style oxrna2/hbond command	2644
4.239	pair_style oxrna2/xstk command	2644
4.240	pair_style oxrna2/coaxstk command	2644
4.241	pair_style oxrna2/dh command	2644
4.241.1	Syntax	2644
4.241.2	Examples	2644
4.241.3	Description	2646
4.241.4	Potential file reading	2647
4.241.5	Unique base pairing	2648
4.241.6	Restrictions	2649
4.241.7	Related commands	2649
4.241.8	Default	2649
4.242	pair_style pace command	2649

4.243	pair_style	pace/extrapolation command	2649
4.243.1		Syntax	2649
4.243.2		Examples	2649
4.243.3		Description	2650
4.243.4		Extrapolation grade	2650
4.243.5		Core repulsion	2651
4.243.6		Mixing, shift, table, tail correction, restart, rRESPA info	2651
4.243.7		Restrictions	2652
4.243.8		Related commands	2652
4.243.9		Default	2652
4.244	pair_style	pace/apip command	2652
4.245	pair_style	pace/fast/apip command	2652
4.246	pair_style	pace/precise/apip command	2652
4.246.1		Syntax	2652
4.246.2		Examples	2652
4.246.3		Description	2653
4.246.4		Mixing, shift, table, tail correction, restart, rRESPA info	2653
4.246.5		Restrictions	2653
4.246.6		Related commands	2653
4.246.7		Default	2654
4.247	pair_style	pedone command	2654
4.247.1		Syntax	2654
4.247.2		Examples	2654
4.247.3		Description	2654
4.247.4		Mixing, shift, table, tail correction, restart, rRESPA info	2655
4.247.5		Restrictions	2655
4.247.6		Related commands	2655
4.247.7		Default	2655
4.248	pair_style	peri/pmb command	2656
4.249	pair_style	peri/lps command	2656
4.250	pair_style	peri/ves command	2656
4.251	pair_style	peri/eps command	2656
4.251.1		Syntax	2656
4.251.2		Examples	2656
4.251.3		Description	2656
4.251.4		Bond breaking criterion	2658
4.251.5		Mixing, shift, table, tail correction, restart, rRESPA info	2659
4.251.6		Restrictions	2659
4.251.7		Related commands	2659
4.251.8		Default	2659
4.252	pair_style	pod command	2659
4.252.1		Syntax	2659
4.252.2		Examples	2659
4.252.3		Description	2660
4.252.4		Mixing, shift, table, tail correction, restart, rRESPA info	2660
4.252.5		Restrictions	2661
4.252.6		Related commands	2661
4.252.7		Default	2661
4.253	pair_style	polymorphic command	2661
4.253.1		Syntax	2661
4.253.2		Examples	2661
4.253.3		Description	2662
4.253.4		Mixing, shift, table, tail correction, restart, rRESPA info	2665
4.253.5		Restrictions	2666

	4.253.6	Related commands	2666
4.254	pair_style	python command	2666
	4.254.1	Syntax	2666
	4.254.2	Examples	2666
	4.254.3	Description	2666
	4.254.4	Mixing, shift, table, tail correction, restart, rRESPA info	2670
	4.254.5	Restrictions	2670
	4.254.6	Related commands	2670
	4.254.7	Default	2670
4.255	pair_style	quip command	2670
	4.255.1	Syntax	2670
	4.255.2	Examples	2670
	4.255.3	Description	2671
	4.255.4	Mixing, shift, table, tail correction, restart, rRESPA info	2671
	4.255.5	Restrictions	2671
	4.255.6	Related commands	2671
4.256	pair_style	rann command	2672
	4.256.1	Syntax	2672
	4.256.2	Examples	2672
	4.256.3	Description	2672
	4.256.4	Potential file syntax	2672
	4.256.5	Formulation	2675
	4.256.6	Restrictions	2677
	4.256.7	Defaults	2677
4.257	pair_style	reaxff command	2677
	4.257.1	Syntax	2677
	4.257.2	Examples	2678
	4.257.3	Description	2678
	4.257.4	Control file	2681
	4.257.5	Mixing, shift, table, tail correction, restart, rRESPA info	2682
	4.257.6	Restrictions	2683
	4.257.7	Related commands	2683
	4.257.8	Default	2683
4.258	pair_style	rebomos command	2683
	4.258.1	Syntax	2683
	4.258.2	Examples	2683
	4.258.3	Description	2683
	4.258.4	Mixing, shift, table, tail correction, restart, rRESPA info	2684
	4.258.5	Restrictions	2684
	4.258.6	Related commands	2685
	4.258.7	Default	2685
4.259	pair_style	resquared command	2685
	4.259.1	Syntax	2685
	4.259.2	Examples	2685
	4.259.3	Description	2685
	4.259.4	Mixing, shift, table, tail correction, restart, rRESPA info	2687
	4.259.5	Restrictions	2687
	4.259.6	Related commands	2688
	4.259.7	Default	2688
4.260	pair_style	rheo command	2688
	4.260.1	Syntax	2688
	4.260.2	Examples	2688
	4.260.3	Description	2688
	4.260.4	Mixing, shift, table, tail correction, restart, rRESPA info	2689

	4.260.5	Restrictions	2689
	4.260.6	Related commands	2689
	4.260.7	Default	2689
4.261	pair_style rheo/solid	command	2689
	4.261.1	Syntax	2689
	4.261.2	Examples	2689
	4.261.3	Description	2689
	4.261.4	Mixing, shift, table, tail correction, restart, rRESPA info	2690
	4.261.5	Restrictions	2690
	4.261.6	Related commands	2690
	4.261.7	Default	2690
4.262	pair_style runner	command	2690
	4.262.1	Syntax	2690
	4.262.2	Examples	2691
	4.262.3	Description	2691
	4.262.4	Mixing, shift, table, tail correction, restart, rRESPA info	2694
	4.262.5	Restrictions	2694
	4.262.6	Related commands	2694
	4.262.7	Default	2694
	4.262.8	References	2695
4.263	pair_style saip/metal	command	2695
4.264	pair_style saip/metal/tmd	command	2695
	4.264.1	Syntax	2695
	4.264.2	Examples	2696
	4.264.3	Description	2696
	4.264.4	Mixing, shift, table, tail correction, restart, rRESPA info	2697
	4.264.5	Restrictions	2697
	4.264.6	Related commands	2698
	4.264.7	Default	2698
4.265	pair_style sdpd/taitwater/isothermal	command	2698
	4.265.1	Syntax	2698
	4.265.2	Examples	2698
	4.265.3	Description	2698
	4.265.4	Mixing, shift, table, tail correction, restart, rRESPA info	2699
	4.265.5	Restrictions	2699
	4.265.6	Related commands	2699
	4.265.7	Default	2699
4.266	pair_style smatb	command	2700
4.267	pair_style smatb/single	command	2700
	4.267.1	Syntax	2700
	4.267.2	Examples	2700
	4.267.3	Description	2700
	4.267.4	Coefficients	2700
	4.267.5	Mixing info	2701
	4.267.6	Restrictions	2701
	4.267.7	Related commands	2701
	4.267.8	Default	2701
4.268	pair_style smd/hertz	command	2701
	4.268.1	Syntax	2701
	4.268.2	Examples	2701
	4.268.3	Description	2702
	4.268.4	Mixing, shift, table, tail correction, restart, rRESPA info	2702
	4.268.5	Restrictions	2702
	4.268.6	Related commands	2702

	4.268.7	Default	2702
4.269	pair_style	smd/tlsph command	2702
	4.269.1	Syntax	2702
	4.269.2	Examples	2702
	4.269.3	Description	2702
	4.269.4	Mixing, shift, table, tail correction, restart, rRESPA info	2703
	4.269.5	Restrictions	2703
	4.269.6	Related commands	2703
	4.269.7	Default	2703
4.270	pair_style	smd/tri_surface command	2703
	4.270.1	Syntax	2703
	4.270.2	Examples	2703
	4.270.3	Description	2703
	4.270.4	Mixing, shift, table, tail correction, restart, rRESPA info	2704
	4.270.5	Restrictions	2704
	4.270.6	Related commands	2704
	4.270.7	Default	2704
4.271	pair_style	smd/ulsph command	2704
	4.271.1	Syntax	2704
	4.271.2	Examples	2704
	4.271.3	Description	2704
	4.271.4	Mixing, shift, table, tail correction, restart, rRESPA info	2705
	4.271.5	Restrictions	2705
	4.271.6	Related commands	2705
	4.271.7	Default	2705
4.272	pair_style	smtbq command	2705
	4.272.1	Syntax	2705
	4.272.2	Examples	2705
	4.272.3	Description	2705
	4.272.4	Mixing, shift, table, tail correction, restart, rRESPA info	2709
	4.272.5	Restrictions	2709
	4.272.6	Citing this work	2709
4.273	pair_style	snap command	2710
	4.273.1	Syntax	2710
	4.273.2	Examples	2710
	4.273.3	Description	2710
	4.273.4	Mixing, shift, table, tail correction, restart, rRESPA info	2712
	4.273.5	Restrictions	2713
	4.273.6	Related commands	2713
	4.273.7	Default	2713
4.274	pair_style	soft command	2713
	4.274.1	Syntax	2714
	4.274.2	Examples	2714
	4.274.3	Description	2714
	4.274.4	Mixing, shift, table, tail correction, restart, rRESPA info	2715
	4.274.5	Restrictions	2715
	4.274.6	Related commands	2715
	4.274.7	Default	2715
4.275	pair_style	sph/heatconduction command	2715
	4.275.1	Syntax	2715
	4.275.2	Examples	2716
	4.275.3	Description	2716
	4.275.4	Mixing, shift, table, tail correction, restart, rRESPA info	2716
	4.275.5	Restrictions	2716

	4.275.6	Related commands	2717
	4.275.7	Default	2717
4.276	pair_style sph/idealgas	command	2717
	4.276.1	Syntax	2717
	4.276.2	Examples	2717
	4.276.3	Description	2717
	4.276.4	Mixing, shift, table, tail correction, restart, rRESPA info	2717
	4.276.5	Restrictions	2718
	4.276.6	Related commands	2718
	4.276.7	Default	2718
4.277	pair_style sph/lj	command	2718
	4.277.1	Syntax	2718
	4.277.2	Examples	2718
	4.277.3	Description	2718
	4.277.4	Mixing, shift, table, tail correction, restart, rRESPA info	2719
	4.277.5	Restrictions	2719
	4.277.6	Related commands	2719
	4.277.7	Default	2719
4.278	pair_style sph/rhsum	command	2719
	4.278.1	Syntax	2719
	4.278.2	Examples	2719
	4.278.3	Description	2720
	4.278.4	Mixing, shift, table, tail correction, restart, rRESPA info	2720
	4.278.5	Restrictions	2720
	4.278.6	Related commands	2720
	4.278.7	Default	2720
4.279	pair_style sph/taitwater	command	2720
	4.279.1	Syntax	2720
	4.279.2	Examples	2721
	4.279.3	Description	2721
	4.279.4	Mixing, shift, table, tail correction, restart, rRESPA info	2721
	4.279.5	Restrictions	2722
	4.279.6	Related commands	2722
	4.279.7	Default	2722
4.280	pair_style sph/taitwater/morris	command	2722
	4.280.1	Syntax	2722
	4.280.2	Examples	2722
	4.280.3	Description	2722
	4.280.4	Mixing, shift, table, tail correction, restart, rRESPA info	2723
	4.280.5	Restrictions	2723
	4.280.6	Related commands	2723
	4.280.7	Default	2723
4.281	pair_style lj/spica	command	2723
4.282	pair_style lj/spica/coul/long	command	2723
4.283	pair_style lj/spica/coul/msm	command	2723
	4.283.1	Syntax	2723
	4.283.2	Examples	2724
	4.283.3	Description	2724
	4.283.4	Mixing, shift, table, tail correction, restart, rRESPA info	2725
	4.283.5	Restrictions	2725
	4.283.6	Related commands	2725
	4.283.7	Default	2725
4.284	pair_style spin/dipole/cut	command	2726
4.285	pair_style spin/dipole/long	command	2726

4.285.1	Syntax	2726
4.285.2	Examples	2726
4.285.3	Description	2726
4.285.4	Restrictions	2727
4.285.5	Related commands	2727
4.285.6	Default	2727
4.286	pair_style spin/dmi command	2727
4.286.1	Syntax	2727
4.286.2	Examples	2727
4.286.3	Description	2727
4.286.4	Restrictions	2728
4.286.5	Related commands	2728
4.286.6	Default	2728
4.287	pair_style spin/exchange command	2728
4.288	pair_style spin/exchange/biquadratic command	2728
4.288.1	Syntax	2728
4.288.2	Examples	2728
4.288.3	Description	2729
4.288.4	Restrictions	2730
4.288.5	Related commands	2731
4.288.6	Default	2731
4.289	pair_style spin/magelec command	2731
4.289.1	Syntax	2731
4.289.2	Examples	2731
4.289.3	Description	2731
4.289.4	Restrictions	2732
4.289.5	Related commands	2732
4.289.6	Default	2732
4.290	pair_style spin/neel command	2732
4.290.1	Syntax	2732
4.290.2	Examples	2732
4.290.3	Description	2732
4.290.4	Restrictions	2733
4.290.5	Related commands	2733
4.290.6	Default	2733
4.291	pair_style srp command	2733
4.292	pair_style srp/react command	2733
4.292.1	Syntax	2733
4.292.2	Examples	2734
4.292.3	Description	2734
4.292.4	Mixing, shift, table, tail correction, restart, rRESPA info	2735
4.292.5	Restrictions	2736
4.292.6	Related commands	2736
4.292.7	Default	2736
4.293	pair_style surf/granular command	2736
4.293.1	Syntax	2736
4.293.2	Examples	2736
4.293.3	Description	2736
4.293.4	Mixing, shift, table, tail correction, restart, rRESPA info	2737
4.293.5	Restrictions	2737
4.293.6	Related commands	2738
4.293.7	Default	2738
4.294	pair_style sw command	2738
4.295	pair_style sw/mod command	2738

4.295.1	Syntax	2738
4.295.2	Examples	2738
4.295.3	Description	2739
4.295.4	Mixing, shift, table, tail correction, restart, rRESPA info	2742
4.295.5	Restrictions	2742
4.295.6	Related commands	2742
4.295.7	Default	2742
4.296	pair_style sw/angle/table command	2742
4.296.1	Syntax	2742
4.296.2	Examples	2743
4.296.3	Description	2743
4.296.4	Mixing, shift, table, tail correction, restart, rRESPA info	2746
4.296.5	Restrictions	2746
4.296.6	Related commands	2746
4.297	pair_style table command	2746
4.297.1	Syntax	2746
4.297.2	Examples	2746
4.297.3	Description	2747
4.297.4	Mixing, shift, table, tail correction, restart, rRESPA info	2749
4.297.5	Restrictions	2750
4.297.6	Related commands	2750
4.297.7	Default	2750
4.298	pair_style table/rx command	2750
4.298.1	Syntax	2750
4.298.2	Examples	2750
4.298.3	Description	2750
4.298.4	Mixing, shift, table, tail correction, restart, rRESPA info	2752
4.298.5	Restrictions	2753
4.298.6	Related commands	2753
4.298.7	Default	2753
4.299	pair_style tersoff command	2753
4.300	pair_style tersoff/table command	2753
4.300.1	Syntax	2753
4.300.2	Examples	2754
4.300.3	Description	2754
4.300.4	Mixing, shift, table, tail correction, restart, rRESPA info	2757
4.300.5	Restrictions	2757
4.300.6	Related commands	2757
4.300.7	Default	2758
4.301	pair_style tersoff/mod command	2758
4.302	pair_style tersoff/mod/c command	2758
4.302.1	Syntax	2758
4.302.2	Examples	2758
4.302.3	Description	2758
4.302.4	Mixing, shift, table, tail correction, restart, rRESPA info	2761
4.302.5	Restrictions	2761
4.302.6	Related commands	2761
4.302.7	Default	2761
4.303	pair_style tersoff/zbl command	2761
4.303.1	Syntax	2762
4.303.2	Examples	2762
4.303.3	Description	2762
4.303.4	Mixing, shift, table, tail correction, restart, rRESPA info	2765
4.303.5	Restrictions	2765

	4.303.6	Related commands	2766
	4.303.7	Default	2766
4.304	pair_style	thole command	2766
4.305	pair_style	lj/cut/thole/long command	2766
	4.305.1	Syntax	2766
	4.305.2	Examples	2766
	4.305.3	Description	2766
	4.305.4	Mixing, shift, table, tail correction, restart, rRESPA info	2768
	4.305.5	Restrictions	2768
	4.305.6	Related commands	2768
	4.305.7	Default	2768
4.306	pair_style	threebody/table command	2768
	4.306.1	Syntax	2768
	4.306.2	Examples	2769
	4.306.3	Description	2769
	4.306.4	Mixing, shift, table, tail correction, restart, rRESPA info	2771
	4.306.5	Restrictions	2772
	4.306.6	Related commands	2772
4.307	pair_style	tracker command	2772
	4.307.1	Syntax	2772
	4.307.2	Examples	2773
	4.307.3	Description	2773
	4.307.4	Mixing, shift, table, tail correction, restart, rRESPA info	2774
	4.307.5	Restrictions	2774
	4.307.6	Related commands	2774
	4.307.7	Default	2774
4.308	pair_style	tri/lj command	2774
	4.308.1	Syntax	2774
	4.308.2	Examples	2774
	4.308.3	Description	2775
	4.308.4	Mixing, shift, table, tail correction, restart, rRESPA info	2775
	4.308.5	Restrictions	2776
	4.308.6	Related commands	2776
	4.308.7	Default	2776
4.309	pair_style	uf3 command	2776
	4.309.1	Syntax	2776
	4.309.2	Examples	2776
	4.309.3	Description	2776
	4.309.4	Mixing, shift, table, tail correction, restart, rRESPA info	2779
	4.309.5	Restrictions	2779
	4.309.6	Related commands	2779
	4.309.7	Default	2779
4.310	pair_style	ufm command	2779
	4.310.1	Syntax	2779
	4.310.2	Examples	2779
	4.310.3	Description	2780
	4.310.4	Mixing, shift, table, tail correction, restart, rRESPA info	2781
	4.310.5	Restrictions	2781
	4.310.6	Related commands	2781
	4.310.7	Default	2781
4.311	pair_style	vashishta command	2781
4.312	pair_style	vashishta/table command	2781
	4.312.1	Syntax	2781
	4.312.2	Examples	2782

4.312.3	Description	2782
4.312.4	Mixing, shift, table, tail correction, restart, rRESPA info	2784
4.312.5	Restrictions	2784
4.312.6	Related commands	2784
4.312.7	Default	2784
4.313	pair_style wf/cut command	2785
4.313.1	Syntax	2785
4.313.2	Examples	2785
4.313.3	Description	2785
4.313.4	Restrictions	2786
4.313.5	Related commands	2786
4.314	pair_style ylz command	2787
4.314.1	Syntax	2787
4.314.2	Examples	2787
4.314.3	Description	2787
4.314.4	Mixing, shift, table, tail correction, restart, rRESPA info	2788
4.314.5	Restrictions	2788
4.314.6	Related commands	2789
4.314.7	Default	2789
4.315	pair_style yukawa command	2789
4.315.1	Syntax	2789
4.315.2	Examples	2789
4.315.3	Description	2789
4.315.4	Mixing, shift, table, tail correction, restart, rRESPA info	2790
4.315.5	Restrictions	2790
4.315.6	Related commands	2790
4.315.7	Default	2790
4.316	pair_style yukawa/colloid command	2790
4.316.1	Syntax	2790
4.316.2	Examples	2791
4.316.3	Description	2791
4.316.4	Mixing, shift, table, tail correction, restart, rRESPA info	2792
4.316.5	Restrictions	2792
4.316.6	Related commands	2792
4.316.7	Default	2792
4.317	pair_style zbl command	2793
4.317.1	Syntax	2793
4.317.2	Examples	2793
4.317.3	Description	2793
4.317.4	Mixing, shift, table, tail correction, restart, rRESPA info	2794
4.317.5	Restrictions	2794
4.317.6	Related commands	2794
4.317.7	Default	2794
4.318	pair_style zero command	2795
4.318.1	Syntax	2795
4.318.2	Examples	2795
4.318.3	Description	2795
4.318.4	Mixing, shift, table, tail correction, restart, rRESPA info	2795
4.318.5	Restrictions	2796
4.318.6	Related commands	2796
4.318.7	Default	2796

5	Bond Styles	2797
5.1	bond_style bpm/rotational command	2797

5.1.1	Syntax	2797
5.1.2	Examples	2798
5.1.3	Description	2798
5.1.4	Restart and other info	2800
5.1.5	Restrictions	2800
5.1.6	Related commands	2801
5.1.7	Default	2801
5.2	bond_style bpm/spring command	2801
5.2.1	Syntax	2801
5.2.2	Examples	2802
5.2.3	Description	2802
5.2.4	Restart and other info	2804
5.2.5	Restrictions	2804
5.2.6	Related commands	2804
5.2.7	Default	2804
5.3	bond_style bpm/spring/plastic command	2805
5.3.1	Syntax	2805
5.3.2	Examples	2805
5.3.3	Description	2805
5.3.4	Restart and other info	2806
5.3.5	Restrictions	2806
5.3.6	Related commands	2807
5.3.7	Default	2807
5.4	bond_style class2 command	2807
5.4.1	Syntax	2807
5.4.2	Examples	2807
5.4.3	Description	2807
5.4.4	Restrictions	2808
5.4.5	Related commands	2808
5.4.6	Default	2808
5.5	bond_style fene command	2808
5.6	bond_style fene/nm command	2808
5.6.1	Syntax	2808
5.6.2	Examples	2808
5.6.3	Description	2809
5.6.4	Restrictions	2810
5.6.5	Related commands	2810
5.6.6	Default	2810
5.7	bond_style fene/expand command	2810
5.7.1	Syntax	2810
5.7.2	Examples	2810
5.7.3	Description	2810
5.7.4	Restrictions	2811
5.7.5	Related commands	2811
5.7.6	Default	2811
5.8	bond_style gaussian command	2811
5.8.1	Syntax	2811
5.8.2	Examples	2811
5.8.3	Description	2812
5.8.4	Restrictions	2812
5.8.5	Related commands	2812
5.8.6	Default	2812
5.9	bond_style gromos command	2813
5.9.1	Syntax	2813

	5.9.2	Examples	2813
	5.9.3	Description	2813
	5.9.4	Restrictions	2813
	5.9.5	Related commands	2813
	5.9.6	Default	2813
5.10	bond_style	harmonic command	2814
	5.10.1	Syntax	2814
	5.10.2	Examples	2814
	5.10.3	Description	2814
	5.10.4	Restrictions	2814
	5.10.5	Related commands	2814
	5.10.6	Default	2814
5.11	bond_style	harmonic/restrain command	2815
	5.11.1	Syntax	2815
	5.11.2	Examples	2815
	5.11.3	Description	2815
	5.11.4	Restart info	2815
	5.11.5	Restrictions	2816
	5.11.6	Related commands	2816
	5.11.7	Default	2816
5.12	bond_style	harmonic/shift command	2816
	5.12.1	Syntax	2816
	5.12.2	Examples	2816
	5.12.3	Description	2816
	5.12.4	Restrictions	2817
	5.12.5	Related commands	2817
	5.12.6	Default	2817
5.13	bond_style	harmonic/shift/cut command	2817
	5.13.1	Syntax	2817
	5.13.2	Examples	2817
	5.13.3	Description	2817
	5.13.4	Restrictions	2818
	5.13.5	Related commands	2818
	5.13.6	Default	2818
5.14	bond_style	hybrid command	2818
	5.14.1	Syntax	2818
	5.14.2	Examples	2818
	5.14.3	Description	2818
	5.14.4	Restrictions	2819
	5.14.5	Related commands	2819
	5.14.6	Default	2819
5.15	bond_style	lepton command	2819
	5.15.1	Syntax	2820
	5.15.2	Examples	2820
	5.15.3	Description	2820
	5.15.4	Lepton expression syntax and features	2821
	5.15.5	Restrictions	2822
	5.15.6	Related commands	2822
	5.15.7	Default	2822
5.16	bond_style	mesocnt command	2822
	5.16.1	Syntax	2822
	5.16.2	Examples	2822
	5.16.3	Description	2822
	5.16.4	Restrictions	2823

	5.16.5	Related commands	2823
	5.16.6	Default	2823
5.17	bond_style	mm3 command	2823
	5.17.1	Syntax	2823
	5.17.2	Examples	2823
	5.17.3	Description	2823
	5.17.4	Restrictions	2824
	5.17.5	Related commands	2824
	5.17.6	Default	2824
5.18	bond_style	morse command	2824
	5.18.1	Syntax	2824
	5.18.2	Examples	2824
	5.18.3	Description	2825
	5.18.4	Restrictions	2825
	5.18.5	Related commands	2825
	5.18.6	Default	2825
5.19	bond_style	none command	2825
	5.19.1	Syntax	2825
	5.19.2	Examples	2825
	5.19.3	Description	2826
	5.19.4	Restrictions	2826
	5.19.5	Related commands	2826
	5.19.6	Default	2826
5.20	bond_style	nonlinear command	2826
	5.20.1	Syntax	2826
	5.20.2	Examples	2826
	5.20.3	Description	2826
	5.20.4	Restrictions	2827
	5.20.5	Related commands	2827
	5.20.6	Default	2827
5.21	bond_style	oxdna/fene command	2827
5.22	bond_style	oxdna2/fene command	2827
5.23	bond_style	oxdna3/fene command	2827
5.24	bond_style	oxrna2/fene command	2827
	5.24.1	Syntax	2827
	5.24.2	Examples	2827
	5.24.3	Description	2828
	5.24.4	Potential file reading	2829
	5.24.5	Restrictions	2830
	5.24.6	Related commands	2830
	5.24.7	Default	2830
5.25	bond_style	quartic command	2830
	5.25.1	Syntax	2830
	5.25.2	Examples	2830
	5.25.3	Description	2830
	5.25.4	Restrictions	2832
	5.25.5	Related commands	2832
	5.25.6	Default	2832
5.26	bond_style	quartic/exp command	2832
	5.26.1	Syntax	2832
	5.26.2	Examples	2832
	5.26.3	Description	2832
	5.26.4	Restrictions	2833
	5.26.5	Related commands	2833

	5.26.6	Default	2833
5.27	bond_style	rheo/shell command	2833
	5.27.1	Syntax	2833
	5.27.2	Examples	2834
	5.27.3	Description	2834
	5.27.4	Restart and other info	2835
	5.27.5	Restrictions	2835
	5.27.6	Related commands	2835
	5.27.7	Default	2835
5.28	bond_style	special command	2835
	5.28.1	Syntax	2835
	5.28.2	Examples	2836
	5.28.3	Description	2836
	5.28.4	Restrictions	2836
	5.28.5	Related commands	2837
	5.28.6	Default	2837
5.29	bond_style	table command	2837
	5.29.1	Syntax	2837
	5.29.2	Examples	2837
	5.29.3	Description	2837
	5.29.4	Restart info	2839
	5.29.5	Restrictions	2839
	5.29.6	Related commands	2839
	5.29.7	Default	2839
5.30	bond_style	zero command	2839
	5.30.1	Syntax	2839
	5.30.2	Examples	2839
	5.30.3	Description	2839
	5.30.4	Restrictions	2840
	5.30.5	Related commands	2840
	5.30.6	Default	2840
6	Angle Styles		2841
6.1	angle_style	amoeba command	2841
	6.1.1	Syntax	2841
	6.1.2	Examples	2841
	6.1.3	Description	2841
	6.1.4	Restrictions	2842
	6.1.5	Related commands	2842
	6.1.6	Default	2843
6.2	angle_style	charmm command	2843
	6.2.1	Syntax	2843
	6.2.2	Examples	2843
	6.2.3	Description	2843
	6.2.4	Restrictions	2844
	6.2.5	Related commands	2844
	6.2.6	Default	2844
6.3	angle_style	class2 command	2844
6.4	angle_style	class2xe command	2844
6.5	angle_style	class2/p6 command	2844
	6.5.1	Syntax	2844
	6.5.2	Examples	2844
	6.5.3	Description	2844
	6.5.4	Restrictions	2847

	6.5.5	Related commands	2847
	6.5.6	Default	2847
6.6	angle_style	cosine command	2848
	6.6.1	Syntax	2848
	6.6.2	Examples	2848
	6.6.3	Description	2848
	6.6.4	Restrictions	2848
	6.6.5	Related commands	2848
	6.6.6	Default	2848
6.7	angle_style	cosine/buck6d command	2849
	6.7.1	Syntax	2849
	6.7.2	Examples	2849
	6.7.3	Description	2849
	6.7.4	Restrictions	2849
	6.7.5	Related commands	2850
	6.7.6	Default	2850
6.8	angle_style	cosine/delta command	2850
	6.8.1	Syntax	2850
	6.8.2	Examples	2850
	6.8.3	Description	2850
	6.8.4	Restrictions	2851
	6.8.5	Related commands	2851
	6.8.6	Default	2851
6.9	angle_style	cosine/periodic command	2851
	6.9.1	Syntax	2851
	6.9.2	Examples	2851
	6.9.3	Description	2851
	6.9.4	Restrictions	2852
	6.9.5	Related commands	2852
	6.9.6	Default	2852
6.10	angle_style	cosine/shift command	2852
	6.10.1	Syntax	2852
	6.10.2	Examples	2852
	6.10.3	Description	2852
	6.10.4	Restrictions	2853
	6.10.5	Related commands	2853
	6.10.6	Default	2853
6.11	angle_style	cosine/shift/exp command	2853
	6.11.1	Syntax	2853
	6.11.2	Examples	2853
	6.11.3	Description	2853
	6.11.4	Restrictions	2854
	6.11.5	Related commands	2854
	6.11.6	Default	2854
6.12	angle_style	cosine/squared command	2854
	6.12.1	Syntax	2854
	6.12.2	Examples	2854
	6.12.3	Description	2854
	6.12.4	Restrictions	2855
	6.12.5	Related commands	2855
	6.12.6	Default	2855
6.13	angle_style	cosine/squared/restricted command	2855
	6.13.1	Syntax	2855
	6.13.2	Examples	2855

	6.13.3	Description	2856
	6.13.4	Restrictions	2856
	6.13.5	Related commands	2856
	6.13.6	Default	2856
6.14	angle_style	cross command	2856
	6.14.1	Syntax	2857
	6.14.2	Examples	2857
	6.14.3	Description	2857
	6.14.4	Restrictions	2857
	6.14.5	Related commands	2858
	6.14.6	Default	2858
6.15	angle_style	dipole command	2858
	6.15.1	Syntax	2858
	6.15.2	Examples	2858
	6.15.3	Description	2858
	6.15.4	Restrictions	2859
	6.15.5	Related commands	2859
	6.15.6	Default	2859
6.16	angle_style	fourier command	2860
	6.16.1	Syntax	2860
	6.16.2	Examples	2860
	6.16.3	Description	2860
	6.16.4	Restrictions	2860
	6.16.5	Related commands	2860
	6.16.6	Default	2861
6.17	angle_style	fourier/simple command	2861
	6.17.1	Syntax	2861
	6.17.2	Examples	2861
	6.17.3	Description	2861
	6.17.4	Restrictions	2861
	6.17.5	Related commands	2862
	6.17.6	Default	2862
6.18	angle_style	gaussian command	2862
	6.18.1	Syntax	2862
	6.18.2	Examples	2862
	6.18.3	Description	2862
	6.18.4	Restrictions	2863
	6.18.5	Related commands	2863
	6.18.6	Default	2863
6.19	angle_style	harmonic command	2863
	6.19.1	Syntax	2863
	6.19.2	Examples	2863
	6.19.3	Description	2863
	6.19.4	Restrictions	2864
	6.19.5	Related commands	2864
	6.19.6	Default	2864
6.20	angle_style	hybrid command	2864
	6.20.1	Syntax	2864
	6.20.2	Examples	2864
	6.20.3	Description	2864
	6.20.4	Restrictions	2865
	6.20.5	Related commands	2866
	6.20.6	Default	2866
6.21	angle_style	lepton command	2866

	6.21.1	Syntax	2866
	6.21.2	Examples	2866
	6.21.3	Description	2866
	6.21.4	Lepton expression syntax and features	2867
	6.21.5	Restrictions	2868
	6.21.6	Related commands	2868
	6.21.7	Default	2868
6.22	angle_style	mesocnt command	2868
	6.22.1	Syntax	2868
	6.22.2	Examples	2868
	6.22.3	Description	2869
	6.22.4	Restrictions	2870
	6.22.5	Related commands	2870
	6.22.6	Default	2870
6.23	angle_style	mm3 command	2870
	6.23.1	Syntax	2870
	6.23.2	Examples	2870
	6.23.3	Description	2870
	6.23.4	Restrictions	2871

About LAMMPS and this manual

LAMMPS stands for **L**arge-scale **A**tomic/**M**olecular **M**assively **P**arallel **S**imulator.

LAMMPS is a classical molecular dynamics simulation code focusing on materials modeling. It was designed to run efficiently on parallel computers and to be easy to extend and modify. Originally developed at Sandia National Laboratories, a US Department of Energy facility, LAMMPS now includes contributions from many research groups and individuals from many institutions. Most of the funding for LAMMPS has come from the US Department of Energy (DOE). LAMMPS is open-source software distributed under the terms of the GNU Public License Version 2 (GPLv2).

The [LAMMPS website](#) has a variety of information about the code. It includes links to an online version of this manual, an [online forum](#) where users can post questions and discuss LAMMPS, and a [GitHub site](#) where all LAMMPS development is coordinated.

The content for this manual is part of the LAMMPS distribution in its doc directory.

- The version of the manual on the LAMMPS website corresponds to the latest LAMMPS feature release. It is available at: <https://docs.lammps.org/>.
- A version of the manual corresponding to the latest LAMMPS stable release (state of the *stable* branch on GitHub) is available online at: <https://docs.lammps.org/stable/>
- A version of the manual with the features most recently added to LAMMPS (state of the *develop* branch on GitHub) is available at: <https://docs.lammps.org/latest/>

If needed, you can build a copy on your local machine of the manual (HTML pages or PDF file) for the version of LAMMPS you have downloaded. Follow the steps on the [Build the LAMMPS documentation](#) page.

The manual is organized into three parts:

1. The *User Guide* with information about how to obtain, configure, compile, install, and use LAMMPS,
 2. the *Programmer Guide* with information about how to use the LAMMPS library interface from different programming languages, how to modify and extend LAMMPS, the program design, internal programming interfaces, and code design conventions,
 3. the *Command Reference* with detailed descriptions of all input script commands available in LAMMPS.

Part I

User Guide

INTRODUCTION

These pages provide a brief introduction to LAMMPS.

1.1 Overview of LAMMPS

LAMMPS is a classical molecular dynamics (MD) code that models ensembles of particles in a liquid, solid, or gaseous state. It can model atomic, polymeric, biological, solid-state (metals, ceramics, oxides), granular, coarse-grained, or macroscopic systems using a variety of interatomic potentials (force fields) and boundary conditions. It can model 2d or 3d systems with sizes ranging from only a few particles up to billions.

LAMMPS can be built and run on single laptop or desktop machines, but is designed for parallel computers. It will run in serial and on any parallel machine that supports the [MPI](#) message-passing library. This includes shared-memory multicore, multi-CPU servers and distributed-memory clusters and supercomputers. Parts of LAMMPS also support [OpenMP multi-threading](#), vectorization, and GPU acceleration.

LAMMPS is written in C++ and currently requires a compiler that is at least compatible with the C++-11 standard. Earlier versions were written in F77, F90, and C++-98. See the [History page](#) of the website for details. All versions can be downloaded as source code from the [LAMMPS website](#).

Through a [C language API](#) LAMMPS functionality can be accessed and managed from other programming languages rather than running the LAMMPS executable. Ready to use modules for [Python](#) and [Fortran](#) exist, and an example [SWIG interface file](#) as well as example C files for dynamically loading LAMMPS as a shared library into other executables are provided.

LAMMPS is designed to be easy to modify or extend with new capabilities, such as new force fields, atom types, boundary conditions, or diagnostics. See the [Modifying & extending LAMMPS](#) section for more details.

In the most general sense, LAMMPS integrates Newton's equations of motion for a collection of interacting particles. A single particle can be an atom or molecule or electron, a coarse-grained cluster of atoms, or a mesoscopic or macroscopic clump of material. The interaction models that LAMMPS includes are mostly short-ranged in nature; some long-range models are included as well.

LAMMPS uses neighbor lists to keep track of nearby particles. The lists are optimized for systems with particles that are repulsive at short distances, so that the local density of particles never becomes too large. This is in contrast to methods used for modeling plasma or gravitational bodies (like galaxy formation).

On parallel machines, LAMMPS uses spatial-decomposition techniques with MPI parallelization to partition the simulation domain into subdomains of equal computational cost, one of which is assigned to each processor. Processors communicate and store "ghost" atom information for atoms that border their subdomain. Multi-threading parallelization and GPU acceleration with particle-decomposition can be used in addition.

1.2 What does a LAMMPS version mean

The LAMMPS “version” is the date when it was released, such as 1 May 2014. LAMMPS is updated continuously, and with the help of extensive automated testing (mostly applied *before* changes are included) we aim to keep it working correctly and reliably at all times, but there also are regular *feature releases* with new and expanded functionality, and there are designated *stable releases* that receive updates with bug fixes back-ported from the development branch.

In addition to automated testing, several variants of static code analysis are run regularly to maintain or improve the overall code quality, consistency, and compliance with programming standards, best practices and style conventions. You can follow its development in a public [git repository on GitHub](#).

Each version of LAMMPS contains all the documented *features* up to and including its version date. For recently added features, we add markers to the documentation at which specific LAMMPS version a feature or keyword was added or significantly changed.

1.2.1 Identifying the Version

The version date is printed to the screen and log file every time you run LAMMPS. There also is an indication, if a LAMMPS binary was compiled from version with modifications **after** a release, either from the development version or the maintenance version of the last stable release. It is also visible in the file `src/version.h` and in the LAMMPS directory name created when you unpack a downloaded tarball. And it is on the first page of the [manual](#).

- If you browse the HTML pages of the online version of the LAMMPS manual, they will by default describe the most current feature release version of LAMMPS. In the navigation bar on the bottom left, there is the option to view instead the documentation for the most recent *stable* version or the documentation corresponding to the state of the development branch *develop*.
- If you browse the HTML pages included in your downloaded tarball, they describe the version you have, which may be older than the online version.

1.2.2 LAMMPS releases, branches, and tags

Fig. 1: Relations between releases, main branches, and tags in the LAMMPS git repository

Development

Modifications of the LAMMPS source code (like bug fixes, code refactoring, updates to existing features, or addition of new features) are organized into pull requests. Pull requests will be merged into the *develop* branch of the LAMMPS git repository on GitHub after they pass automated testing and code review by [core LAMMPS developers](#).

Feature Releases

When a sufficient number of new features and updates have accumulated *and* the LAMMPS version on the *develop* branch passes an extended set of automated tests, we release it as a *feature release*, which are currently made every 4 to 8 weeks. The *release* branch of the git repository is updated with every such *feature release* and a tag in the format `patch_1May2014` is added. A summary of the most important changes of these releases for the current year are posted on [this website page](#). More detailed release notes are [available on GitHub](#).

Stable Releases

About once a year, we release a *stable release* version of LAMMPS. This is done after a “stabilization period” where we apply only bug fixes and small, non-intrusive changes to the *develop* branch but no new features to the core code. At the same time, the code is subjected to more detailed and thorough manual testing that goes beyond the automated testing done by default. After such a *stable release*, both the *release* and the *stable* branches are updated and two tags are applied, a `patch_1May2014` format and a `stable_1May2014` format tag.

Stable Release Updates

Between *stable releases*, we collect bug fixes and updates that are back-ported from the *develop* branch in a branch called *maintenance*. From the *maintenance* branch we make occasional *stable update releases* and update the *stable* branch accordingly. The first update to the `stable_1May2014` release would be tagged as `stable_1May2014_update1`. These updates contain no new features and are intended to be fully backward compatible.

1.3 LAMMPS features

LAMMPS is a classical molecular dynamics (MD) code with these general classes of functionality:

1. *General features*
2. *Particle and model types*
3. *Interatomic potentials (force fields)*
4. *Atom creation*
5. *Ensembles, constraints, and boundary conditions*
6. *Integrators*
7. *Diagnostics*
8. *Output*
9. *Multi-replica models*
10. *Pre- and post-processing*
11. *Specialized features (beyond MD itself)*

1.3.1 General features

- runs on a single processor or in parallel
- distributed memory message-passing parallelism (MPI)
- shared memory multi-threading parallelism (OpenMP)
- spatial decomposition of simulation domain for MPI parallelism
- particle decomposition inside spatial decomposition for OpenMP and GPU parallelism
- GPLv2 licensed open-source distribution
- highly portable C++-17 (optional packages may require C++20)
- modular code with most functionality in optional packages
- only depends on MPI library for basic parallel functionality, MPI stub for serial compilation
- other libraries are optional and only required for specific packages

- GPU (CUDA, OpenCL, HIP, SYCL) and OpenMP support for many code features
- easy to extend with new features and functionality
- runs from an input script
- syntax for defining and using variables and formulas
- syntax for looping over runs and breaking out of loops
- run one or multiple simulations simultaneously (in parallel) from one script
- build as library, invoke LAMMPS through library interface (from C, C++, Fortran) or provided Python wrapper or SWIG based wrappers
- couple with other codes: LAMMPS calls other code, other code calls LAMMPS, umbrella code calls both, MDI coupling interface
- call out to Python for computing forces, time integration, or other tasks
- plugin interface for loading external features at runtime
- large integrated collection of tests

1.3.2 Particle and model types

(See *atom style* command)

- atoms
- coarse-grained particles (e.g. bead-spring polymers)
- united-atom polymers or organic molecules
- all-atom polymers, organic molecules, proteins, DNA
- metals
- metal oxides
- granular materials
- coarse-grained mesoscale models
- finite-size spherical and ellipsoidal particles
- finite-size line segment (2d) and triangle (3d) particles
- finite-size rounded polygons (2d) and polyhedra (3d) particles
- point dipole particles
- particles with magnetic spin
- rigid collections of n particles
- hybrid combinations of these

1.3.3 Interatomic potentials (force fields)

(See *pair style*, *bond style*, *angle style*, *dihedral style*, *improper style*, *kpace style* commands)

- pairwise potentials: Lennard-Jones, Buckingham, Morse, Born-Mayer-Huggins, Yukawa, soft, Class II (COMPASS), hydrogen bond, harmonic, gaussian, tabulated, scripted
- charged pairwise potentials: Coulombic, point-dipole

- many-body potentials: EAM, Finnis/Sinclair, MEAM, MEAM+SW, EIM, EDIP, ADP, Stillinger-Weber, Tersoff, REBO, AIREBO, ReaxFF, COMB, Streitz-Mintmire, 3-body polymorphic, BOP, Vashishta
- machine learning potentials: ACE, AGNI, GAP, Behler-Parrinello (N2P2), POD, RANN, SNAP
- interfaces to ML potentials distributed by external groups: ANI, ChIMES, DeepPot, HIPNN, MTP
- long-range interactions for charge, point-dipoles, and LJ dispersion: Ewald, Wolf, PPPM (similar to particle-mesh Ewald), MSM, ScaFaCoS
- polarization models: *QEq*, *core/shell model*, *Drude dipole model*
- charge equilibration (QEq via dynamic, point, shielded, Slater methods)
- coarse-grained potentials: DPD, GayBerne, RESquared, colloidal, DLVO, oxDNA / oxRNA, SPICA
- mesoscopic potentials: granular, Peridynamics, SPH, mesoscopic tubular potential (MESONT)
- semi-empirical potentials: multi-ion generalized pseudopotential theory (MGPT), second moment tight binding + QEq (SMTB-Q)
- electron force field (eFF)
- bond potentials: harmonic, FENE, Morse, nonlinear, Class II (COMPASS), quartic (breakable), tabulated, scripted
- angle potentials: harmonic, CHARMM, cosine, cosine/squared, cosine/periodic, Class II (COMPASS), tabulated, scripted
- dihedral potentials: harmonic, CHARMM, multi-harmonic, helix, Class II (COMPASS), OPLS, tabulated, scripted
- improper potentials: harmonic, cvff, umbrella, Class II (COMPASS), tabulated
- polymer potentials: all-atom, united-atom, bead-spring, breakable
- water potentials: TIP3P, TIP4P, SPC, SPC/E and variants
- interlayer potentials for graphene and analogues, hetero-junctions
- metal-organic framework potentials (QuickFF, MO-FF)
- implicit solvent potentials: hydrodynamic lubrication, Debye
- force-field compatibility with CHARMM, AMBER, DREIDING, OPLS, GROMACS, Class II (COMPASS), UFF, ClayFF, DREIDING, AMOEBA, INTERFACE
- access to the [OpenKIM Repository](#) of potentials via the *kim command*
- hybrid potentials: multiple pair, bond, angle, dihedral, improper potentials can be used in one simulation
- overlaid potentials: superposition of multiple pair potentials (including many-body) with optional scale factor

1.3.4 Atom creation

(See *read_data*, *lattice*, *create_atoms*, *delete_atoms*, *displace_atoms*, *replicate* commands)

- read in atom coordinates from files
- create atoms on one or more lattices (e.g. grain boundaries)
- delete geometric or logical groups of atoms (e.g. voids)
- replicate existing atoms multiple times
- displace atoms

1.3.5 Ensembles, constraints, and boundary conditions

(See *fix* command)

- 2d or 3d systems
- orthogonal or non-orthogonal (triclinic symmetry) simulation domains
- constant NVE, NVT, NPT, NPH, Parrinello/Rahman integrators
- thermostatting options for groups and geometric regions of atoms
- pressure control via Nose/Hoover or Berendsen barostatting in 1 to 3 dimensions
- simulation box deformation (tensile and shear)
- harmonic (umbrella) constraint forces
- rigid body constraints
- SHAKE / RATTLE bond and angle constraints
- motion constraints to manifold surfaces
- Monte Carlo bond breaking, formation, swapping, template based reaction modeling
- atom/molecule insertion and deletion
- walls of various kinds, static and moving
- non-equilibrium molecular dynamics (NEMD)
- variety of additional boundary conditions and constraints

1.3.6 Integrators

(See *run*, *run_style*, *minimize* commands)

- velocity-Verlet integrator
- Brownian dynamics
- rigid body integration
- energy minimization via conjugate gradient, steepest descent relaxation, or damped dynamics (FIRE, Quickmin)
- rRESPA hierarchical timestepping
- fixed or adaptive time step
- rerun command for post-processing of dump files

1.3.7 Diagnostics

- see various flavors of the *fix* and *compute* commands
- introspection command for system, simulation, and compile time settings and configurations

1.3.8 Output

(*dump*, *restart* commands)

- log file of thermodynamic info
- text dump files of atom coordinates, velocities, other per-atom quantities
- dump output on fixed and variable intervals, based timestep or simulated time

- binary restart files
- parallel I/O of dump and restart files
- per-atom quantities (energy, stress, centro-symmetry parameter, CNA, etc.)
- user-defined system-wide (log file) or per-atom (dump file) calculations
- custom partitioning (chunks) for binning, and static or dynamic grouping of atoms for analysis
- spatial, time, and per-chunk averaging of per-atom quantities
- time averaging and histogramming of system-wide quantities
- atom snapshots in native, XYZ, XTC, DCD, CFG, NetCDF, HDF5, ADIOS2, YAML formats
- on-the-fly compression of output and decompression of read in files

1.3.9 Multi-replica models

- *nudged elastic band*
- *hyperdynamics*
- *parallel replica dynamics*
- *temperature accelerated dynamics*
- *parallel tempering*
- path-integral MD: *first variant*, *second variant*
- multi-walker collective variables with *Colvars* and *Plumed*

1.3.10 Pre- and post-processing

- A handful of pre- and post-processing tools are packaged with LAMMPS, some of which can convert input and output files to/from formats used by other codes; see the *Tools* page.
- Our group has also written and released a separate toolkit called *Pizza.py* which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations. *Pizza.py* is written in *Python* and is available for download from the *Pizza.py* WWW site.

1.3.11 Specialized features

LAMMPS can be built with optional packages which implement a variety of additional capabilities. See the *Optional Packages* page for details.

These are LAMMPS capabilities which you may not think of as typical classical MD options:

- *static* and *dynamic load-balancing*, optional with recursive bisectioning decomposition
- *generalized aspherical particles*
- *stochastic rotation dynamics (SRD)*
- *real-time visualization and interactive MD, built-in renderer for images and movies*
- calculate *virtual diffraction patterns*
- calculate *finite temperature phonon dispersion* and the *dynamical matrix of minimized structures*
- *QM/MM coupling*
- Monte Carlo via *GCMC* and *tfMC* and *atom swapping*
- *path-integral molecular dynamics (PIMD)* and *this as well*

- *Direct Simulation Monte Carlo* for low-density fluids
- *Peridynamics modeling*
- *Lattice Boltzmann fluid*
- *targeted* and *steered* molecular dynamics
- *two-temperature electron model*

1.4 LAMMPS non-features

LAMMPS is designed to be a fast, parallel engine for molecular dynamics (MD) simulations. It provides only a modest amount of functionality for setting up simulations and analyzing their output.

Originally, LAMMPS was not conceived and designed for:

- being run through a GUI
- building molecular systems, or building molecular topologies
- assign force-field coefficients automagically
- perform sophisticated analysis of your MD simulation
- visualize your MD simulation interactively
- plot your output data

Over the years many of these limitations have been reduced or removed. In part through features added to LAMMPS and in part through external tools that either closely interface with LAMMPS or extend LAMMPS.

Here are suggestions on how to perform these tasks:

- **GUI:** LAMMPS can be built as a library and a Python module that wraps the library interface is provided. Thus, GUI interfaces can be written in Python or C/C++ that run LAMMPS and visualize or plot its output. Examples of this are provided in the `python` directory and described on the [Python](#) doc page. Since version 2 August 2023 the [LAMMPS-GUI application](#) is available and can be compiled together with LAMMPS and linked to the LAMMPS library for running and visualizing LAMMPS simulation inputs. As of August 2025, LAMMPS-GUI is maintained in its own [repository on GitHub](#). Also, there are several external wrappers or GUI front ends that are mentioned on the [Pre-/post-processing tools](#) page of the LAMMPS homepage.
- **Builder:** Several pre-processing tools are packaged with LAMMPS. Some of them convert input files in formats produced by other MD codes such as CHARMM, AMBER, or Insight into LAMMPS input formats. Some of them are simple programs that will build simple molecular systems, such as linear bead-spring polymer chains. The `moltemplate` program is a true molecular builder that will generate complex molecular models. See the [Tools](#) page for details on tools packaged with LAMMPS. The [Pre-/post-processing tools](#) page of the LAMMPS homepage describes a variety of third party tools for this task. Furthermore, some internal LAMMPS commands allow reconstructing, or selectively adding topology information, as well as provide the option to insert molecule templates instead of atoms for building bulk molecular systems.
- **Force-field assignment:** The conversion tools described in the previous bullet for CHARMM, AMBER, and Insight will also assign force field coefficients in the LAMMPS format, assuming you provide CHARMM, AMBER, or BIOVIA (formerly Accelrys) force field files. The tools [ParmEd](#) and [InterMol](#) are particularly powerful and flexible in converting force field and topology data between various MD simulation programs.
- **Simulation analysis:** If you want to perform analysis on-the-fly as your simulation runs, see the [compute](#) and [fix](#) doc pages, which list commands that can be used in a LAMMPS input script. Also see the [Modify](#) page for info on how to add your own analysis code or algorithms to LAMMPS. For post-processing, LAMMPS output such as [dump file snapshots](#) can be converted into formats used by other MD or post-processing codes. To some degree, that conversion can be done directly inside LAMMPS by interfacing to the VMD molfile plugins. The [rerun](#) command also allows post-processing of existing trajectories, and through being able to read a variety of

file formats, this can also be used for analyzing trajectories from other MD codes. Some post-processing tools packaged with LAMMPS will do these conversions. Scripts provided in the `tools/python` directory can extract and massage data in dump files to make it easier to import into other programs. See the [Tools](#) page for details on these various options.

The [Pre-/post-processing](#) page on the LAMMPS homepage lists some external packages for analysis of MD simulation data, including data produced by LAMMPS.

- **Visualization:** LAMMPS can produce NETPBM, TGA, JPG, or PNG format snapshot images on-the-fly via its `dump image` command and pass them to an external program, `FFmpeg`, to generate movies from them. The *LAMMPS-GUI tool* has a *Snapshot Image Viewer* which uses `dump image` and allows to modify the visualization settings interactively. It also has a *Slide Show* feature where images created by `dump image` are collected during a simulation and can be animated interactively or exported to a movie with `FFmpeg` or `ImageMagick`.

For high-quality, interactive visualization, there are many excellent and free tools available. See the [Visualization Tools](#) page of the LAMMPS website for visualization packages that can process LAMMPS output data.

- **Plotting:** See the next bullet about `Pizza.py` as well as the [Python](#) page for examples of plotting LAMMPS output. Scripts provided with the `python` tool in the `tools` directory will extract and process data in log and dump files to make it easier to analyze and plot. See the [Tools](#) doc page for more discussion of the various tools.

The *LAMMPS-GUI tool* has a *Chart Viewer* where *thermodynamic data* computed by LAMMPS is collected during the simulation and plotted immediately.

- **Pizza.py:** Our group has also written a separate toolkit called `Pizza.py` which can do certain kinds of setup, analysis, plotting, and visualization (via OpenGL) for LAMMPS simulations. It thus provides some functionality for several of the above bullets. `Pizza.py` is written in [Python](#) and is available for download from <https://lammps.github.io/pizza/>.

1.5 LAMMPS portability and compatibility

The primary form of distributing LAMMPS is through highly portable source code. But also several ways of obtaining LAMMPS as *precompiled packages or through automated build mechanisms* exist. Most of LAMMPS is written in C++, some support tools are written in Fortran or Python or MATLAB.

1.5.1 Programming language standards

Changed in version 10Sep2025.

The C++ code in LAMMPS currently requires a compiler that is compatible with the C++17 standard. The Kokkos library used for the KOKKOS package currently also requires at least C++17. If your compilers are not compatible *and* you cannot upgrade to a compatible version, please use LAMMPS version 22 July 2025, which requires only C++11 as the minimum C++ standard.

Most of the Python code in LAMMPS is written to be compatible with Python 3.6 and later.

Deprecated since version 2Apr2025.

Python 2.x is no longer supported and trying to use it, e.g. for the LAMMPS Python module should result in an error. If you come across some part of the LAMMPS distribution that is not (yet) compatible with Python 3, please notify *the LAMMPS developers*.

1.5.2 Build systems

LAMMPS can be compiled from source code using the cross-platform CMake system. CMake must be at least version 3.20. Alternatively, using a (traditional) build system based on shell scripts, a few shell utilities (`grep`, `sed`, `cat`, `tr`) and the GNU make program. This requires running within a Bourne shell (`/bin/sh` or `/bin/bash`).

Changed in version 10Sep2025.

The traditional GNU make based build system no longer supports all packages. Details can be found in the *package specific build instructions*.

1.5.3 Operating systems

The primary development platform for LAMMPS is Linux. Thus, the chances for LAMMPS to compile without problems are the best on Linux machines. Also, compilation and correct execution on macOS and Windows (using Microsoft Visual C++) is checked automatically for the largest part of the source code. Some (optional) features are not compatible with all operating systems, either through limitations of the corresponding LAMMPS source code or through incompatibilities or build system limitations of required external libraries or packages.

Executables for Windows may be created either natively using Cygwin, MinGW, Intel, Clang, or Microsoft Visual C++ compilers, or with a Linux to Windows MinGW cross-compiler. Native compilation is supported using Microsoft Visual Studio or a terminal window (using the CMake build system).

Executables for macOS may be created either using Xcode or GNU compilers installed with Homebrew. In the latter case, building of LAMMPS through Homebrew instead of a manual compile is also possible.

Additionally, FreeBSD and Solaris have been tested successfully to run LAMMPS and produce results consistent with those on Linux.

1.5.4 Compilers

The most commonly used compilers are the GNU compilers, but also Clang and the Intel compilers have been successfully used on Linux, macOS, and Windows. Also, the Nvidia HPC SDK (formerly PGI compilers) will compile LAMMPS (tested on Linux).

Changed in version 10Sep2025.

The GNU compilers *before* version 9.3 have known problems with supporting C++17 and thus are **not** recommended to build LAMMPS.

1.5.5 CPU architectures

The primary CPU architecture for running LAMMPS is 64-bit x86, but also 64-bit ARM is currently regularly tested. Further architectures are tested by Linux distributions that bundle LAMMPS.

1.5.6 Portability compliance

Only a subset of the LAMMPS source code is *fully* compliant to *all* of the above mentioned standards. There is also the case that the source code bundled with LAMMPS *is* compliant and portable, but an external library it depends on is not.

This is rather typical for projects like LAMMPS that largely depend on contributions from the user community. Not all contributors are trained as programmers and not all of them have access to multiple platforms for testing or are familiar with requirement of different C++ standards. As part of the continuous integration process, however, all contributions are automatically tested to compile, link, and pass *some* runtime tests on a selection of Linux flavors, macOS, and Windows, and on Linux with different compilers. Thus portability issues are often found *before* a pull request is merged or a release is made. Other platforms may be checked occasionally or when portability bugs are reported.

1.5.7 Code review and static code analysis

In addition to using automated tests, code contributed to LAMMPS is subject to a code review by core LAMMPS developers (that includes contributions by the core LAMMPS developers themselves).

We make use of a number of static code analysis tools for maintaining and improving the quality of the LAMMPS source code. Tools used include:

- Coverity SCAN

- CodeQL
- Clang Static Analyzer
- Clang-Tidy
- Enabling and looking at compiler warnings

CodeQL alerts for the `develop` branch of LAMMPS can be seen at <https://github.com/lammps/lammps/security/code-scanning>. Static code analysis reports for the `develop` branch from the clang tools are available at <https://download.lammps.org/analysis/>

We currently also request code reviews from [GitHub Copilot](#) to lower the code review workload for the LAMMPS developers. The LAMMPS git repository includes specific instructions for Copilot to particularly look for compliance of submitted pull requests with LAMMPS coding and documentation conventions.

A discussion of software engineering methods applied to LAMMPS over time can be found in the paper *LAMMPS: A Case Study For Applying Modern Software Engineering to an Established Research Software Package*, <<https://doi.org/10.5281/zenodo.17117558>> in USRSE'25 conference proceedings.

1.6 LAMMPS open-source license

1.6.1 GPL version of LAMMPS

LAMMPS is an open-source code, available free-of-charge, and distributed under the terms of the [GNU Public License Version 2](#) (GPLv2), which means you can use or modify the code however you wish for your own purposes, but have to adhere to certain rules when redistributing it - specifically in binary form - or are distributing software derived from it or that includes parts of it.

LAMMPS comes with no warranty of any kind.

As each source file states in its header, it is a copyrighted code, and thus not in the public domain. For more information about open-source software and open-source distribution, see www.gnu.org or www.opensource.org. The legal text of the GPL as it applies to LAMMPS is in the LICENSE file included in the LAMMPS distribution.

Here is a more specific summary of what the GPL means for LAMMPS users:

- (1) Anyone is free to use, copy, modify, or extend LAMMPS in any way they choose, including for commercial purposes.
- (2) If you **distribute** a modified version of LAMMPS, it must remain open-source, meaning you are required to distribute **all** of it under the terms of the GPLv2. You should **clearly** annotate such a modified code as a derivative version of LAMMPS. This is best done by changing the name (example: LIGGGHTS is such a modified and extended version of LAMMPS).
- (3) If you release any code that includes or uses LAMMPS source code, then it must also be open-sourced, meaning you distribute it under the terms of the GPLv2. You may write code that interfaces LAMMPS to a differently licensed library. In that case the code that provides the interface must be licensed GPLv2, but not necessarily that library unless you are distributing binaries that require the library to run.
- (4) If you give LAMMPS files to someone else, the GPLv2 LICENSE file and source file headers (including the copyright and GPLv2 notices) should remain part of the code.

1.6.2 LGPL version of LAMMPS

We occasionally make stable LAMMPS releases available under the [GNU Lesser Public License v2.1](#). This is on request only and with non-LGPL compliant files removed. This allows uses linking non-GPL compatible software with the (otherwise unmodified) LAMMPS library or loading it dynamically at runtime. Any **modifications** to the LAMMPS code however, even with the LGPL licensed version, must still be made available under the same open source terms as LAMMPS itself.

1.7 Authors of LAMMPS

The current core LAMMPS developers are listed here (grouped by seniority and sorted alphabetically by last name). You can email an individual developer with code related questions for their area of expertise, or send an email to all of them at this address: “[developers at lammps.org](mailto:developers@lammps.org)”. General questions about LAMMPS should be posted in the [LAMMPS forum on MatSci](#).

Name	Affiliation	Email	Areas of expertise
Axel Kohlmeyer	Temple U	akohlmey at gmail.com	OpenMP, library interfaces, LAMMPS-GUI, GitHub, MatSci forum, code maintenance, testing, releases
Steve Plimpton	SNL (retired)	sjplimp at gmail.com	original author, MD kernels, parallel algorithms & scalability, code structure and design
Aidan Thompson	SNL	athomps at sandia.gov	manybody potentials, machine learned potentials, materials science, statistical mechanics
Richard Berger	LANL	richard.berger at outlook.com	Python, HPC, DevOps
Germain Clavier	U Caen	germain.clavier at unicaen.fr	organic molecules, polymers, mechanical properties, surfaces, integrators, coarse-graining
Joel Clemmer	SNL	jtclemm at sandia.gov	granular systems fluid/solid mechanics
Jacob R. Gissinger	Stevens Institute of Technology	jgissing at stevens.edu	reactive molecular dynamics, macro-molecular systems, type labels
James Goff	SNL	jmgoff at sandia.gov	machine learned potentials, QEq solvers, Python
Meg McCarthy	SNL	megmcca at sandia.gov	alloys, micro-structure, machine learned potentials
Stan Moore	SNL	stamoore at sandia.gov	Kokkos, KSpace solvers, ReaxFF
Trung Nguyen	U Chicago	ndactrung at gmail.com	soft matter, GPU package, DIELECTRIC package, regression testing

Past core developers include Paul Crozier and Mark Stevens, both at SNL, and Ray Shan while at SNL and later at Materials Design, now at Thermo Fisher Scientific.

The [Authors page](#) of the [LAMMPS website](#) has a comprehensive list of all the individuals who have contributed code for a new feature or command or tool to LAMMPS.

The following folks deserve special recognition. Many of the packages they have written are unique for an MD code and LAMMPS would not be as general-purpose as it is without their expertise and efforts.

- Metin Aktulga (MSU), REAXFF package for C/C++ version of ReaxFF
- Mike Brown (Intel), GPU and INTEL packages
- Colin Denniston (U Western Ontario), LATBOLTZ package
- Georg Ganzenmuller (EMI), MACHDYN and SPH packages
- Andres Jaramillo-Botero (Caltech), EFF package for electron force field
- Reese Jones (Sandia) and colleagues, ATC package for atom/continuum coupling
- Christoph Kloss (DCS Computing), LIGGGHTS code for granular materials, built on top of LAMMPS
- Rudra Mukherjee (JPL), POEMS package for articulated rigid body motion
- Trung Nguyen (U Chicago), GPU, RIGID, BODY, and DIELECTRIC packages
- Mike Parks (Sandia), PERI package for Peridynamics
- Roy Pollock (LLNL), Ewald and PPPM solvers

- Julien Tranchida (CEA Cadarache), SPIN package
 - Christian Trott (Sandia), CUDA and KOKKOS packages
 - Ilya Valuev (JIHT), AWPMD package for wave packet MD
 - Greg Wagner (Northwestern U), MEAM package for MEAM potential
-

As discussed on the [History page](#) of the website, LAMMPS originated as a cooperative project between DOE labs and industrial partners. Folks involved in the design and testing of the original version of LAMMPS were the following:

- John Carpenter (Mayo Clinic, formerly at Cray Research)
- Terry Stouch (Lexicon Pharmaceuticals, formerly at Bristol Myers Squibb)
- Steve Lustig (Dupont)
- Jim Belak and Roy Pollock (LLNL)

1.8 Citing LAMMPS

1.8.1 Core Algorithms

The paper mentioned below is the best overview of LAMMPS, but there are also publications describing particular models or algorithms implemented in LAMMPS or complementary software that it has interfaces to. Please see below for how to cite contributions to LAMMPS.

The latest canonical publication that describes the basic features, the source code design, the program structure, the spatial decomposition approach, the neighbor finding, basic communications algorithms, and how users and developers have contributed to LAMMPS is:

LAMMPS - A flexible simulation tool for particle-based materials modeling at the atomic, meso, and continuum scales, *Comp. Phys. Comm.* 271, 108171 (2022)

So a project using LAMMPS or a derivative application that uses LAMMPS as a simulation engine should cite this paper. The paper is expected to be published in its final form under the same DOI in the first half of 2022. Please also give the URL of the LAMMPS website in your paper, namely <https://www.lammps.org>.

The original publication describing the parallel algorithms used in the initial versions of LAMMPS is:

S. Plimpton, Fast Parallel Algorithms for Short-Range Molecular Dynamics, *J Comp Phys*, 117, 1-19 (1995).

1.8.2 DOI for the LAMMPS source code

The LAMMPS developers use the [Zenodo service at CERN](#) to create digital object identifiers (DOI) for stable releases of the LAMMPS source code. There are two types of DOIs for the LAMMPS source code.

The canonical DOI for **all** versions of LAMMPS, which will always point to the **latest** stable release version, is:

- DOI: [10.5281/zenodo.3726416](https://doi.org/10.5281/zenodo.3726416)

In addition there are DOIs generated for individual stable releases:

- 3 March 2020 version: DOI:[10.5281/zenodo.3726417](https://doi.org/10.5281/zenodo.3726417)
- 29 October 2020 version: DOI:[10.5281/zenodo.4157471](https://doi.org/10.5281/zenodo.4157471)
- 29 September 2021 version: DOI:[10.5281/zenodo.6386596](https://doi.org/10.5281/zenodo.6386596)
- 23 June 2022 version: DOI:[10.5281/zenodo.10806836](https://doi.org/10.5281/zenodo.10806836)
- 2 August 2023 version: DOI:[10.5281/zenodo.10806852](https://doi.org/10.5281/zenodo.10806852)

1.8.3 Home page

The LAMMPS website at <https://www.lammps.org/> is the canonical location for information about LAMMPS and its features.

1.8.4 Citing contributions

LAMMPS has many features that use either previously published methods and algorithms or novel features. It also includes potential parameter files for specific models. Where available, a reminder about references for optional features used in a specific run is printed to the screen and log file. Style and output location can be selected with the *-cite command-line switch*. Additional references are given in the documentation of the *corresponding commands* or in the *Howto tutorials*. Please make certain, that you provide the proper acknowledgments and citations in any published works using LAMMPS.

1.9 Additional website links

The LAMMPS website has a variety of additional info about LAMMPS, beyond what is in this manual. Some other useful resources available online are listed below.

- [LAMMPS source code repository on GitHub](#)
- [LAMMPS plugins source code repository on GitHub](#)
- [LAMMPS forum on matsci.org](#)
- [Recent bug fixes and new features](#)
- [Download info](#)
- [Glossary of terms relevant to LAMMPS](#)

- [Funding for LAMMPS](#)

INSTALL LAMMPS

You can download LAMMPS as an executable or as source code.

When downloading the LAMMPS source code, you also have to *build LAMMPS*. But you have more flexibility as to what features to include or exclude in the build. When you download and install pre-compiled LAMMPS executables, you are limited to install which version of LAMMPS is available and which features are included of these builds. If you plan to *modify or extend LAMMPS*, then you **must** build LAMMPS from the source code.

Note

If you have questions about the pre-compiled LAMMPS executables, you need to contact the people preparing those executables. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

2.1 Download an executable for Linux

Binaries are available for different versions of Linux:

- *Pre-built static Linux x86_64 executables*
- *Pre-built Ubuntu and Debian Linux executables*
- *Pre-built Fedora Linux executables*
- *Pre-built EPEL Linux executables (RHEL, CentOS)*
- *Pre-built OpenSuse Linux executables*
- *Gentoo Linux executable*
- *Arch Linux build-script*

Note

If you have questions about these pre-compiled LAMMPS executables, you need to contact the people preparing those packages. The LAMMPS developers have no control over how they configure and build their packages and when they update them. They may only provide packages for stable release versions and not always update the packages in a timely fashion after a new LAMMPS release is made.

2.1.1 Pre-built static Linux x86_64 executables

Pre-built LAMMPS executables for Linux, that are statically linked and compiled for 64-bit x86 CPUs (x86_64 or AMD64) are available for download at <https://download.lammps.org/static/>. Because of that static linkage (and unlike the Linux distribution specific packages listed below), they do not depend on any installed software and thus should run on *any* 64-bit x86 machine with *any* Linux version.

These executable include most of the available packages and multi-thread parallelization (via INTEL, KOKKOS, or OPENMP package). They are **not** compatible with MPI. Several of the LAMMPS tools executables (e.g. `msi2lmp`) are included as well. Because of the static linkage, there is no `liblammps.so` library file and thus also the LAMMPS python module, which depends on it, is not included.

The compressed tar archives available for download have names following the pattern `lammps-linux-x86_64-<version>.tar.gz` and will all unpack into a `lammps-static` folder. The executables are then in the `lammps-static/bin/` folder. Since they do not depend on any other software, they may be freely moved or copied around.

2.1.2 Pre-built Ubuntu and Debian Linux executables

A pre-built LAMMPS executable, suitable for running on the latest Ubuntu and Debian Linux versions, can be downloaded as a Debian package. This allows you to install LAMMPS with a single command, and stay (mostly) up-to-date with the current stable version of LAMMPS by simply updating your operating system.

To install LAMMPS do the following once:

```
sudo apt-get install lammps
```

This downloads an executable named `lmp` to your box and multiple packages with supporting data, examples and libraries as well as any missing dependencies. For example, the LAMMPS binary in this package is built with the *KIM package* enabled, which results in the above command also installing the `kim-api` binaries when LAMMPS is installed, unless they were installed already. In order to use potentials from openkim.org, you can also install the `openkim-models` package:

```
sudo apt-get install openkim-models
```

Or use the *KIM-API commands* to download and install individual models.

This LAMMPS executable can then be used in the usual way to run input scripts:

```
lmp -in in.lj
```

To update LAMMPS to the latest packaged version, do the following:

```
sudo apt-get update
```

This will also update other packages on your system.

To uninstall LAMMPS, do the following:

```
sudo apt-get remove lammps
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Anton Gladky (gladky.anton@gmail.com) for setting up this Ubuntu package capability.

2.1.3 Pre-built Fedora Linux executables

Pre-built LAMMPS packages for stable releases are available in the Fedora Linux distribution since Fedora version 28. The packages can be installed via the dnf package manager. There are 3 basic varieties (lammmps = no MPI, lammmps-mpich = MPICH MPI library, lammmps-openmpi = OpenMPI MPI library) and for each support for linking to the C library interface (lammmps-devel, lammmps-mpich-devel, lammmps-openmpi-devel), the header for compiling programs using the C library interface (lammmps-headers), and the LAMMPS python module for Python 3. All packages can be installed at the same time and the name of the LAMMPS executable is `lmp` and `lmp_openmpi` or `lmp_mpich` respectively. By default, `lmp` will refer to the serial executable, unless one of the MPI environment modules is loaded (module load `mpi/mpich-x86_64` or module load `mpi/openmpi-x86_64`). Then the corresponding parallel LAMMPS executable can be used. The same mechanism applies when loading the LAMMPS python module.

To install LAMMPS with OpenMPI and run an input `in.lj` with 2 CPUs do:

```
dnf install lammmps-openmpi
module load mpi/openmpi-x86_64
mpirun -np 2 lmp -in in.lj
```

The `dnf install` command is needed only once. In case of a new LAMMPS stable release, `dnf update` will automatically update to the newer version as soon as the RPM files are built and uploaded to the download mirrors. The `module load` command is needed once per (shell) session or shell terminal instance, unless it is automatically loaded from the shell profile.

The LAMMPS binary is built with the *KIM package* which results in the above command also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the *openkim-models* package

```
dnf install openkim-models
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in Fedora.

2.1.4 Pre-built EPEL Linux executable

Pre-built LAMMPS (and KIM) packages for stable releases are available in the [Extra Packages for Enterprise Linux \(EPEL\) repository](#) for use with Red Hat Enterprise Linux (RHEL) or CentOS version 7.x and compatible Linux distributions. Names of packages, executable, and content are the same as described above for Fedora Linux. But RHEL/CentOS 7.x uses the `yum` package manager instead of `dnf` in Fedora 28.

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in EPEL.

2.1.5 Pre-built OpenSuse Linux executable

A pre-built LAMMPS package for stable releases is available in OpenSuse as of Leap 15.0. You can install the package with:

```
zypper install lammmps
```

This includes support for OpenMPI. The name of the LAMMPS executable is `lmp`. To run an input in parallel on 2 CPUs you would do:

```
mpirun -np 2 lmp -in in.lj
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

The LAMMPS binary is built with the *KIM package* which results in the above command also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the *openkim-models* package

```
zypper install openkim-models
```

Thanks to Christoph Junghans (LANL) for making LAMMPS available in OpenSuse.

2.1.6 Gentoo Linux executable

LAMMPS is part of Gentoo's main package tree and can be installed by typing:

```
emerge --ask lammps
```

Note that in Gentoo the LAMMPS source code is downloaded and the package is then compiled and installed on your machine.

Certain LAMMPS packages can be enabled via USE flags, type

```
equery uses lammps
```

for details.

Thanks to Nicolas Bock and Christoph Junghans (LANL) for setting up this Gentoo capability.

2.1.7 Archlinux build-script

LAMMPS is available via Arch's unofficial Arch User repository (AUR). There are three scripts available, named *lammps*, *lammps-beta* and *lammps-git*. They respectively package the stable, feature, and git releases.

To install, you will need to have the git package installed. You may use any of the above names in-place of lammps.

```
git clone https://aur.archlinux.org/lammps.git
cd lammps
makepkg -s
makepkg -i
```

To update LAMMPS, you may repeat the above, or change into the cloned directory, and execute the following, after which, if there are any changes, you may use makepkg as above.

```
git pull
```

Alternatively, you may use an AUR helper to install these packages.

Note that the AUR provides build-scripts that download the source code and then build and install the package on your machine.

2.2 Download an executable for macOS

LAMMPS can be downloaded, built, and configured for macOS with [Homebrew](#). (Alternatively, see the installation instructions for [downloading an executable via Conda](#).) The following LAMMPS packages are unavailable at this time because of additional requirements not yet met: GPU, KOKKOS.

After installing Homebrew, you can install LAMMPS on your system with the following commands:

```
brew install lammmps
```

This will install the executables “lammmps_serial” and “lammmps_mpi”, as well as the LAMMPS “doc”, “potentials”, “tools”, “bench”, and “examples” directories.

Once LAMMPS is installed, you can test the installation with the Lennard-Jones benchmark file:

```
brew test lammmps -v
```

The LAMMPS binary is built with the [KIM package](#), which results in Homebrew also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from [openkim.org](#), you can install the *openkim-models* package

```
brew install openkim-models
```

If you have problems with the installation, you can post issues to [this link](#).

Thanks to Derek Thomas (derek.t. at cello.t.u-tokyo.ac.jp) for setting up the Homebrew capability.

2.3 Download an executable for Windows

Pre-compiled Windows installers which install LAMMPS executables on a Windows system can be downloaded from this site:

<https://packages.lammmps.org/windows.html>

Note that each installer package has a date in its name, which corresponds to the LAMMPS version of the same date. Installers for current and older versions of LAMMPS are available. 32-bit and 64-bit installers are available, and each installer contains both a serial and parallel executable. The installer website also explains how to install the Windows MPI package (MPICH2 from Argonne National Labs), needed to run in parallel with MPI.

The LAMMPS binaries contain *all optional packages* included in the source distribution except: ADIOS, H5MD, KIM, ML-PACE, ML-QUIP, MSCG, NETCDF, QMMM, SCAFACOS, and VTK. The serial version also does not include the LATBOLTZ package. The PYTHON package is only available in the Python installers that bundle a Python runtime. The GPU package is compiled for OpenCL with mixed precision kernels.

The LAMMPS library is compiled as a shared library and the [LAMMPS Python module](#) is installed, so that it is possible to load LAMMPS into a Python interpreter.

The installer site also has instructions on how to run LAMMPS under Windows, once it is installed, in both serial and parallel.

When you download the installer package, you run it on your Windows machine. It will then prompt you with a dialog, where you can choose the installation directory, unpack and copy several executables, potential files, documentation PDFs, selected example files, etc. It will then update a few system settings (e.g. PATH, LAMMPS_POTENTIALS) and add an entry into the Start Menu (with references to the documentation, LAMMPS homepage and more). From that menu, there is also a link to an uninstaller that removes the files and undoes the environment manipulations.

Note that to update to a newer version of LAMMPS, you should typically uninstall the version you currently have, download a new installer, and go through the installation procedure described above. I.e. the same procedure for installing/updating most Windows programs. You can install multiple versions of LAMMPS (in different directories),

but only the executable for the last-installed package will be found automatically, so this should only be done for debugging purposes.

2.4 Download an executable for Linux or macOS via Conda

Pre-compiled LAMMPS binaries are available for macOS and Linux via the [Conda](#) package management system.

First, one must set up the Conda package manager on your system. Follow the instructions to install [Miniconda](#), then create a conda environment (named *my-lammps-env* or whatever you prefer) for your LAMMPS install:

```
conda config --add channels conda-forge
conda create -n my-lammps-env
```

Then, you can install LAMMPS on your system with the following command:

```
conda activate my-lammps-env
conda install lammps
```

The LAMMPS binary is built with the [KIM package](#), which results in Conda also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from [openkim.org](#), you can install the *openkim-models* package

```
conda install openkim-models
```

If you have problems with the installation, you can post issues to [this link](#). Thanks to Jan Janssen (Max-Planck-Institut fuer Eisenforschung) for setting up the Conda capability.

Note

If you have questions about these pre-compiled LAMMPS executables, you need to contact the people preparing those packages. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

2.5 Download source and documentation as a tarball

You can download a current LAMMPS tarball from the [download page](#) of the [LAMMPS website](#) or from GitHub (see below).

You have two choices of tarballs, either the most recent stable release or the most recent feature release. Stable releases occur a few times per year, and undergo more testing before release. Also, between stable releases bug fixes from the feature releases are back-ported and the tarball occasionally updated. Feature releases occur every 4 to 8 weeks. The new contents in all feature releases are listed on the [bug and feature page](#) of the LAMMPS homepage.

Tarballs of older LAMMPS versions can also be downloaded from [this page](#).

Tarballs downloaded from the LAMMPS homepage include the pre-translated LAMMPS documentation (HTML and PDF files) corresponding to that version.

Once you have a tarball, uncompress and untar it with the following command:

```
tar -xzf lammps*.tar.gz
```

This will create a LAMMPS directory with the version date in its name, e.g. *lammps-28Mar23*.

You can also download a compressed tar or zip archives from the “Assets” sections of the [LAMMPS GitHub releases site](#). The file name will be `lammps-<version>.zip` which can be unzipped with the following command, to create a `lammps-<version>` directory:

```
unzip lammps*.zip
```

This version corresponds to the selected LAMMPS feature or stable release (as indicated by the matching git tag) and will only contain the source code and no pre-built documentation.

2.6 Download the LAMMPS source with git

LAMMPS development is coordinated through the “LAMMPS GitHub site”. If you clone the LAMMPS repository onto your local machine, it has several advantages:

- You can stay current with changes to LAMMPS with a single git command.
- You can create your own development branches to add code to LAMMPS.
- You can submit your new features back to GitHub for inclusion in LAMMPS. For that, you should first create your own *fork on GitHub*, though.

You must have [git](#) installed on your system to use the commands explained below to communicate with the git servers on GitHub.

You can follow the LAMMPS development on 4 different git branches:

- **develop** : this branch follows the ongoing development and is updated with every merge commit of a pull request
- **release** : this branch is updated with every “feature release” and updates are always “fast-forward” merges from *develop*
- **maintenance** : this branch collects back-ported bug fixes from the *develop* branch to the *stable* branch. It is used to update the *stable* branch for “stable update releases”.
- **stable** : this branch is updated from the *release* branch with every “stable release” version and also has selected bug fixes with every “update release” when the *maintenance* branch is merged into it

To access the git repository on your box, use the clone command to create a local copy of the LAMMPS repository with a command like:

```
git clone -b release https://github.com/lammps/lammps.git mylammps
```

where “mylammps” is the name of the directory you wish to create on your machine and “release” is one of the 3 branches listed above. (Note that you actually download all 3 branches; you can switch between them at any time using “git checkout <branch name>”.)

Saving time and disk space when using git clone

The complete git history of the LAMMPS project is quite large because it contains the entire commit history of the project since fall 2006, which includes the time when LAMMPS was managed with subversion. This includes a few commits that have added and removed some large files (mostly by accident). If you do not need access to the entire commit history (most people don’t), you can speed up the “cloning” process and reduce local disk space requirements by using the `--depth` git command-line flag. That will create a “shallow clone” of the repository, which contains only a subset of the git history. Using a depth of 1000 is usually sufficient to include the head commits of the *develop*, the *release*, and the *maintenance* branches. To include the head commit of the *stable* branch you may need a depth of up to 10000. If you later need more of the git history, you can always convert the shallow clone into a “full clone”.

Once the command completes, your directory will contain the same files as if you unpacked a current LAMMPS tarball, with the exception, that the HTML documentation files are not included. They can be generated from the content provided in `doc/src` by typing `make html` from the `doc` directory.

After initial cloning, as bug fixes and new features are added to LAMMPS you can stay up-to-date by typing the following git commands from within the “mylammps” directory:

```
git checkout release      # not needed if you always stay in this branch
git checkout stable       # use one of these 4 checkout commands
git checkout develop      # to choose the branch to follow
git checkout maintenance
git pull
```

Doing a “pull” will not change any files you have added to the LAMMPS directory structure. It will also not change any existing LAMMPS files you have edited, unless those files have changed in the repository. In that case, git will attempt to merge the changes from the repository file with your version of the file and tell you if there are any conflicts. See the git documentation for details.

If you want to access a particular previous release version of LAMMPS, you can instead “check out” any version with a published tag. See the output of `git tag -l` for the list of tags. The git command to do this is as follows.

```
git checkout tagID
```

Stable versions and what tagID to use for a particular stable version are discussed on [this page](#). Note that this command will print some warnings, because in order to get back to the latest revision and to be able to update with `git pull` again, you will need to do `git checkout release` (or check out any other desired branch) first.

Once you have updated your local files with a `git pull` (or `git checkout`), you still need to re-build LAMMPS if any source files have changed. How to do this depends on the build system you are using.

CMake build

Change to your build folder and type:

```
cmake --build .
```

CMake should auto-detect whether it needs to re-run the CMake configuration step and otherwise redo the build for all files that have been changed or files that depend on changed files. In case some build options have been changed or renamed, you may have to update those by running:

```
cmake .
```

and then rebuild.

Traditional make

Switch to the `src` directory and type:

```
make purge      # remove any deprecated src files
make package-update  # sync package files with src files
make foo        # re-build for your machine (mpi, serial, etc)
```

to enforce consistency of the source between the `src` folder and package directories. This is OK to do even if you don’t use any packages. The `make purge` command removes any deprecated `src` files if they were removed by the update from a package subdirectory.

Warning

If you wish to edit/change a src file that is from a package, you should edit the version of the file inside the package subdirectory with src, then re-install the package. The version in the source directory is merely a copy and will be wiped out if you type “make package-update”.

i Git protocols

The servers at github.com support the “https” access protocol for anonymous, read-only access. If you have a suitably configured GitHub account, you may also use SSH protocol with the URL `git@github.com:lammps/lammps.git`.

The LAMMPS GitHub project is currently overseen by Axel Kohlmeyer (Temple U, akohlmey at gmail.com), contact him if you have any questions or concerns.

You can find additional LAMMPS features for dynamically loading with the *plugin command* in the [LAMMPS plugins source code repository on GitHub](#)

These are the files and subdirectories in the LAMMPS distribution:

README	Short description of the LAMMPS package
LICENSE	GNU General Public License (GPL)
SECURITY.md	Security policy for the LAMMPS package
bench	benchmark inputs
cmake	CMake build files
doc	documentation and tools to build the manual
examples	example input files
fortran	Fortran module for LAMMPS library interface
lib	additional provided or external libraries
potentials	selected interatomic potential files
python	Python module for LAMMPS library interface
src	LAMMPS source files
tools	pre- and post-processing tools
unittest	source code and inputs for testing LAMMPS

You will have all of these if you downloaded the LAMMPS source code. You will have only some of them if you downloaded executables, as explained on the pages listed above.

BUILD LAMMPS

LAMMPS is built as a library and an executable from source code using a build environment generated by CMake (Unix Makefiles, Ninja, Xcode, Visual Studio, KDevelop, CodeBlocks and more depending on the platform). Using CMake is the preferred way to build LAMMPS.

In addition, LAMMPS can be compiled using the legacy build system based on traditional makefiles for use with GNU make (which may require manual editing).

Warning

The LAMMPS developers plan to retire the legacy build system. Please switch to *using CMake* instead. Contact the the LAMMPS developers at developers@lammms.org if you have any concerns or questions about this.

As an alternative, you can download a package with pre-built executables or automated build trees, as described in the *Install* section of the manual.

3.1 Prerequisites

Which software you need to compile and use LAMMPS strongly depends on which *features and settings* and which *optional packages* you are trying to include. Common to all is that you need a C++ and C compiler, where the C++ compiler has to support at least the C++17 standard (note that some compilers require a command-line flag to activate C++17 support).

3.1.1 CMake build system

If you are building with CMake, you need at least CMake version 3.20 and a compatible build tool (e.g. GNU make or ninja-build on Linux). The CMake scripting includes tests for required software and will auto-detect and auto-enable available tools and libraries for optional features (of course those can be disabled, if desired). If required software is missing, CMake will try to download the compile the missing parts automatically, if possible or stop with an error.

3.1.2 GNU build system

If you are building LAMMPS with the legacy GNU make based build system you need GNU make (other make variants are not going to work since the build system uses features unique to GNU make) and a Unix-like build environment with a Bourne shell, and shell tools like “sed”, “grep”, “touch”, “test”, “tr”, “cp”, “mv”, “rm”, “ln”, “diff” and so on. Parts of LAMMPS interface with or use Python version 3.6 or later.

3.1.3 Compiler and OS compatibility

The LAMMPS developers aim to keep LAMMPS very portable and usable - at least in parts - on most operating systems commonly used for running MD simulations. Please see the [section on portability](#) for more details.

Warning: LLVM based Intel Compilers

In recent years, Intel switched their compilers from a proprietary code base to compilers based on LLVM (which is also the foundation of the Clang compilers). It has since stopped updating their legacy compilers. Some versions of those LLVM compilers creates incorrect binary code that results in incorrect behavior of LAMMPS; this is particularly common when using high optimization levels and vectorization. There have been several cases where people reported bugs in LAMMPS which turned out to be caused by bugs in the Intel LLVM compilers.

Unfortunately there is no simple way to detect whether a binary is working correctly outside of running the unit and regression tests, but those do not cover all of LAMMPS and would be reliable only for no or moderate optimization anyway. For most of LAMMPS there is not much of a benefit (if any) to use the Intel compilers over the GCC or Clang compilers, except for the INTEL package (which *can* be compiled with other compilers, but most vectorization directives are inactive for those) or KOKKOS with SYCL.

Our recommendation is thus to compile with GCC or Clang unless you are using features that *require* the Intel compilers. In that case, it is recommended to have a backup GCC/Clang compiled binary available to validate correctness of the simulation. If you have access to multiple Intel compiler versions, please try the latest version first and avoid “20##.0” versions which seem to have problems most often.

3.2 Build LAMMPS with CMake

This page describes how to use [CMake](#) in general to build LAMMPS. Details for specific compile time settings and options to enable and configure add-on packages are discussed with those packages. Links to those pages on the [Build overview](#) page.

The following text assumes some familiarity with CMake and focuses on using the command-line tool `cmake` and what settings are supported for building LAMMPS. A more detailed tutorial on how to use CMake itself, the text mode or graphical user interface, to change the generated output files for different build tools and development environments is on a [separate page](#).

Note

LAMMPS currently requires CMake version 3.20 or later.

Warning

You **must not** mix the [traditional make based](#) LAMMPS build procedure with using CMake. No packages may be installed or a build been previously attempted in the LAMMPS source directory by using `make <machine>`. CMake will detect if this is the case and generate an error. To remove conflicting files from the `src` you can use the command `make no-all purge` which will uninstall all packages and delete all auto-generated files.

3.2.1 Advantages of using CMake

CMake is the preferred way of compiling LAMMPS in contrast to the legacy build system based on GNU make and through [\(manually customized\) makefiles](#). Using CMake has multiple advantages that are specifically helpful for people with limited experience in compiling software or for people that want to modify or extend LAMMPS.

- CMake can detect available hardware, tools, features, and libraries and adapt the LAMMPS default build configuration accordingly.
- CMake can generate files for different build tools and integrated development environments (IDE).
- CMake supports customization of settings with a command-line, text mode, or graphical user interface. No manual editing of files, knowledge of file formats or complex command-line syntax is required.
- All enabled components are compiled in a single build operation.
- Automated dependency tracking for all files and configuration options.
- Support for true out-of-source compilation. Multiple configurations and settings with different choices of LAMMPS packages, settings, or compilers can be configured and built concurrently from the same source tree.
- Simplified packaging of LAMMPS for Linux distributions, environment modules, or automated build tools like [Spack](#) or [Homebrew](#).
- Integration of automated unit and regression testing.

3.2.2 Getting started

Building LAMMPS with CMake is a two-step process. In the first step, you use CMake to generate a build environment in a new directory. For that purpose you can use either the command-line utility `cmake` (or `cmake3`), the text-mode UI utility `ccmake` (or `ccmake3`) or the graphical utility `cmake-gui`, or use them interchangeably. The second step is then the compilation and linking of all objects, libraries, and executables using the selected build tool. Here is a minimal example using the command-line version of CMake to build LAMMPS with no add-on packages enabled and no customization:

```
cd lammeps                # change to the LAMMPS source distribution directory
cmake -S cmake -B build   # configure the "build" folder with CMake scripts from "cmake"
cmake --build build       # compilation (or type "make -C build")
```

This will create a folder called `build`, then run the configuration step to generate build files for the default build command and then launch that build command to compile LAMMPS. During the configuration step CMake will try to detect whether support for MPI, OpenMP, FFTW, gzip, JPEG, PNG, and ffmpeg are available and enable the corresponding configuration settings. The progress of this configuration can be followed on the screen and a summary of selected options and settings will be printed at the end. The `cmake --build build` command will launch the compilation, which, if successful, will ultimately produce a library `liblammeps.a` and the LAMMPS executable `lmp` inside the `build` folder.

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with adding `--parallel N` to the `cmake` command line (with N being the maximum number of concurrently executed tasks). Installation of the [ccache](#) (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development, especially when repeatedly switching between branches.

After the initial build, whenever you edit LAMMPS source files, enable or disable packages, change compiler flags or build options, you must re-compile and relink the LAMMPS executable with `cmake --build build` (or `make -C build`). If the compilation fails for some reason, try running `cmake build` and then compile again. The included dependency tracking should make certain that only the necessary subset of files is re-compiled. You can also delete compiled objects, libraries, and executables with `cmake --build build --target clean` (or `make -C build clean`).

After compilation, you may optionally install the LAMMPS executable into your system with:

```
cmake --install build     # optional, copy compiled files into installation location
```

This will install the LAMMPS executable and library, some tools (if configured) and additional files like LAMMPS API headers, manpages, potential and force field files. The location of the installation tree defaults to `${HOME}/.local`.

Note

If you have set `-D CMAKE_INSTALL_PREFIX` to install LAMMPS into a system location on a Linux machine, you also have to run (as root) the `ldconfig` program to update the cache file for fast lookup of system shared libraries.

Using the installed library

The CMake installation functionality is an experimental work in progress and thus not without problems, especially when writing your own program that is trying to use the LAMMPS C++ classes directly.

While there is a well-defined *C-language interface* with the `library.h` header file, there is no equivalent for the C++ interface yet. When installing LAMMPS, only the core header files are copied into the installation folder and thus only high-level access to C++ features is available.

The following is a minimal CMake example file for using the installed LAMMPS package which represents the current state of development:

```
cmake_minimum_required(VERSION 3.20)
project(simpleCC CXX)
# set this to the LAMMPS installation location
if(NOT CMAKE_PREFIX_PATH)
  set(CMAKE_PREFIX_PATH $ENV{HOME}/.local)
endif()
find_package(LAMMPS REQUIRED)
add_executable(simpleCC simple.cpp)
target_link_libraries(simpleCC PRIVATE LAMMPS::LAMMPS)
```

The `CMAKE_PREFIX_PATH` setting tells CMake where to find the generated CMake configuration files for the `find_package()` CMake command. You can also specify a required minimal version or version range. For that a numeric representation in the “YYYY.MM.DD” format has to be used: the 10 September 2025 release thus becomes version 2025.09.10. The include statements in the `simple.cpp` source file have to be prefixed with `lammps/` as follows:

```
#include <lammps/lammps.h>
#include <lammps/input.h>
#include <lammps/atom.h>
#include <lammps/library.h>
```

Using the `LAMMPS::LAMMPS` target imported from the installed LAMMPS CMake configuration files should set up the include and linker flags and folders automatically. Below is the output for an example session (note how it checks for and includes MPI and OpenMP support since that specific LAMMPS library was set up this way):

```
$ cmake -S . -B build -D CMAKE_PREFIX_PATH=$HOME/Downloads/test-install
-- The CXX compiler identification is GNU 15.2.1
-- Detecting CXX compiler ABI info
-- Detecting CXX compiler ABI info - done
-- Check for working CXX compiler: /usr/lib64/ccache/c++ - skipped
-- Detecting CXX compile features
-- Detecting CXX compile features - done
-- Found MPI_CXX: /usr/lib64/mpich/lib/libmpicxx.so (found version "4.1")
-- Found MPI: TRUE (found version "4.1") found components: CXX
-- Found OpenMP_CXX: -fopenmp (found version "4.5")
-- Found OpenMP: TRUE (found version "4.5") found components: CXX
-- Found LAMMPS: /home/akohlmey/Downloads/test-install/lib64/liblammps.so.0

-- Build files have been written to: /home/akohlmey/Downloads/test-simple/build

$ cmake --build build
[ 50%] Building CXX object CMakeFiles/simpleCC.dir/simple.cpp.o
[100%] Linking CXX executable simpleCC
[100%] Built target simpleCC
```

3.2.3 Configuration and build options

The CMake commands have one mandatory argument: a folder containing a file called `CMakeLists.txt` (for LAMMPS it is located in the `cmake` folder, in that case the current working directory becomes the build folder) or a build folder containing a file called `CMakeCache.txt`, which is generated at the end of the CMake configuration step. The cache file contains all current CMake settings. This is a “legacy mode” of running CMake and thus often found when searching the web. We recommend to use the `-S` and `-B` folders to explicitly set the path to the folder containing the `CMakeLists.txt` file and the build folder, respectively.

To modify settings, enable or disable features, you need to set *variables* with either the `-D` command-line flag (`-D VARIABLE1_NAME=value`) or change them in the text mode of the graphical user interface. The `-D` flag can be used several times in one command.

For your convenience, we provide *CMake presets* that combine multiple settings to enable optional LAMMPS packages or use a different compiler tool chain. Those are loaded with the `-C` flag (`-C ../cmake/presets/basic.cmake`). This step would only be needed once, as the settings from the preset files are stored in the `CMakeCache.txt` file. It is also possible to customize the build by adding one or more `-D` flags to the CMake command.

Generating files for alternate build tools (e.g. Ninja) and project files for IDEs like Eclipse, CodeBlocks, or Kate can be selected using the `-G` command-line flag. A list of available generator settings for your specific CMake version is given when running `cmake --help`.

3.2.4 Build targets

The LAMMPS CMake files are set up to have multiple “targets”, one for each component that is set up to be built. If you do not provide an explicit target when building, the target “all” is assumed. This should build all configured targets and include re-running CMake to update the build files when files have changed or new files were added which could require updates in the build process. The most important individual targets are “lammps” to build the LAMMPS library and “lmp” to build the LAMMPS executable. If you want to selectively want to update only one of them you can use the command:

```
cmake --build build --target lmp
```

Especially, when programming LAMMPS and you are making only local changes, or only want to make certain that the code still compiles and links, you may want to skip many of the extra steps that are run by default and then append “/fast” to the target. Example:

```
cmake --build build --target lammps/fast
```

Note that this speeds up the build by avoiding to re-run CMake and skipping a lot of checks for possible dependencies, so you may occasionally need to compile without the “/fast” suffix or use the “all” (= default) target to update everything. This would be *required* when adding new files, additional dependencies, or making changes to the CMake scripts.

Some custom targets, e.g. “install-python” are explicitly excluded from the “all” target and must be built individually.

3.2.5 Multi-configuration build systems

Throughout this manual, it is mostly assumed that LAMMPS is being built on a Unix-like operating system with “make” as the underlying “builder”, since this is the most common case. In this case the build “configuration” is chosen using `-D CMAKE_BUILD_TYPE=<configuration>` with `<configuration>` being one of “Release”, “Debug”, “RelWithDebInfo”, or “MinSizeRel”. Some build tools, however, can also use or even require having a so-called multi-configuration build system setup. For a multi-configuration build, the built type (or configuration) is selected at compile time using the same build files. E.g. with:

```
cmake --build build-multi --config Release
```

In that case the resulting binaries are not in the build folder directly but in subdirectories corresponding to the build type (i.e. Release in the example from above). Similarly, for running unit tests the configuration is selected with the `-C` flag:

```
ctest -C Debug
```

The CMake scripts in LAMMPS have basic support for being compiled using a multi-config build system, but not all of it has been ported. This is in particular applicable to compiling packages that require additional libraries that would be downloaded and compiled by CMake. The `windows.cmake` preset file tries to keep track of which packages can be compiled natively with the MSVC compilers out-of-the box. Not all of the external libraries are portable to Windows, either.

3.2.6 Installing CMake

Check if your machine already has CMake installed:

```
which cmake          # do you have it?
which cmake3          # version 3 may have this name
cmake --version       # what specific version you have
```

On clusters or supercomputers which use environment modules to manage software packages, do this:

```
module list           # is a module for cmake already loaded?
module avail          # is a module for cmake available?
module load cmake     # load cmake module with appropriate name
```

Most Linux distributions offer pre-compiled cmake packages through their package management system. If you do not have CMake or a recent enough version (Note: for CentOS 7.x you need to enable the EPEL repository), you can download the latest version from <https://cmake.org/download/>. Links to more details on CMake can be found [on this page](#).

3.3 Build LAMMPS with make

Warning

The LAMMPS developers plan to retire the legacy build system. Please switch to *using CMake* instead. There is also a detailed discussion of *how to use CMake with LAMMPS* and the [CMake online documentation](#). For the impatient, there is also a quick transition guide below. Contact the the LAMMPS developers at developers@lammeps.org if you have any concerns or questions about this.

3.3.1 Make to CMake quick-start guide

Action	Traditional make command in (src/)	CMake equivalent in (main folder)
Initial Setup	None or Edit Makefile.<machine>	<code>cmake -S cmake -B build</code>
Build	<code>make <machine></code>	<code>cmake --build build</code>
Parallel build	<code>make -j 8 <machine></code>	<code>cmake --build build --parallel 8</code>
Enable package	<code>make yes-<package name></code>	<code>cmake build -D PKG_<PACKAGE_NAME>=yes</code>
Disable package	<code>make no-<package name></code>	<code>cmake build -D PKG_<PACKAGE_NAME>=no</code>
Load a preset configuration	Choose a Makefile.<machine> from MAKE folders	<code>cmake build -C cmake/presets/<preset>.cmake</code>
List enabled packages	<code>make ps</code> (or <code>make package-status</code>)	Check CMake output or use <code>ccmake build</code>
Change configuration settings	Copy Makefile.<machine> to MAKE/MINE and edit	Rerun CMake with changed options
Clean build files	<code>make clean-<machine></code>	<code>cmake --build build --target clean</code>
Full reset	<code>make no-all clean-all purge</code>	<code>rm -rf build</code>
Enable or disable MPI	Use <code>make mpi</code> or <code>make serial</code>	Auto-detected, override with <code>-D BUILD_MPI=no</code>
Enable or disable OpenMP	Edit Makefile.<machine>	Auto-detected, override with <code>-D BUILD_OMP=no</code>
Build LAMMPS shared library	<code>make mode=shared <machine></code>	Use <code>-D BUILD_SHARED_LIBS=yes</code>

Some general CMake tips:

- You can have multiple independent build folders with different configurations (e.g. MPI on/off or different package selections). The convention is that the name starts with “build” (e.g. build-serial)
- To build a LAMMPS executable with defaults and most packages that do not need manual configurations: `cmake -S cmake -B build -C cmake/presets/most.cmake; cmake --build build`
- To make multiple configuration changes interactively use either `ccmake build` or edit build/CMakeCache.txt in a text editor and run `cmake build`

3.3.2 Basics

Building LAMMPS with traditional makefiles requires that you have a Makefile.<machine> file appropriate for your system in either the src/MAKE, src/MAKE/MACHINES, src/MAKE/OPTIONS, or src/MAKE/MINE directory (see below). It can include various options for customizing your LAMMPS build with a number of global compilation options and features.

This build system is slowly being phased out and does no longer support all optional features and packages in LAMMPS. It is recommended to switch to the *CMake based build system*.

3.3.3 Requirements

Those makefiles are written for and tested with GNU make and may not be compatible with other make programs. In most cases, if the “make” program is not GNU make, then there will be a GNU make program available under the name “gmake”. If GNU make or a compatible make is not available, you may have to first install it or switch to building with *CMake*. The makefiles of the traditional make based build process and the scripts they are calling expect a few additional tools to be available and functioning.

- A working C/C++ compiler tool chain supporting the C++17 standard; on Linux, these are often the GNU compilers. Some older compiler versions require adding flags like `-std=c++17` to enable C++17 mode.
- A Bourne shell compatible “Unix” shell program (frequently this is bash)
- A few shell utilities: `ls`, `mv`, `ln`, `rm`, `grep`, `sed`, `tr`, `cat`, `touch`, `diff`, `dirname`
- Python (optional, required for `make lib-<pkg>` in the `src` folder). Python scripts are currently tested with 3.6 to 3.11. The procedure for *building the documentation* requires Python 3.8 or later.

3.3.4 Getting started

To include LAMMPS packages (i.e. optional commands and styles) you must enable (or “install”) them first, as discussed on the *Build package* page. If a package requires (provided or external) libraries, you must configure and build those libraries **before** building LAMMPS itself and especially **before** enabling such a package with `make yes-<package>`. *Building LAMMPS with CMake* can automate much of this for many types of machines, especially workstations, desktops, and laptops, so we suggest you try it first when building LAMMPS in those cases.

The commands below perform a default LAMMPS build, producing the LAMMPS executable `lmp_serial` and `lmp_mpi` in `lammps/src`:

```
cd lammps/src      # change to main LAMMPS source folder
make serial        # build a serial LAMMPS executable using GNU g++
make mpi           # build a parallel LAMMPS executable with MPI
make               # see a variety of make options
```

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with `make -j N` (with `N` being the maximum number of concurrently executed tasks). Installation of the `ccache` (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development, especially when repeatedly switching between branches.

After the initial build, whenever you edit LAMMPS source files, or add or remove new files to the source directory (e.g. by installing or uninstalling packages), you must re-compile and relink the LAMMPS executable with the same `make <machine>` command. The makefile’s dependency tracking should ensure that only the necessary subset of files is re-compiled. If you change settings in the makefile, you have to recompile *everything*. To delete all objects, you can use `make clean-<machine>`.

Note

Before the actual compilation starts, LAMMPS will perform several steps to collect information from the configuration and setup that is then embedded into the executable. When you build LAMMPS for the first time, it will also compile a tool to quickly determine a list of dependencies. Those are required for the make program to correctly detect, which files need to be recompiled or relinked after changes were made to the sources.

3.3.5 Customized builds and alternate makefiles

The `src/MAKE` directory tree contains the `Makefile.<machine>` files included in the LAMMPS distribution. Typing `make example` uses `Makefile.example` from one of those folders, if available. The `make serial` and `make mpi` lines above, for example, use `src/MAKE/Makefile.serial` and `src/MAKE/Makefile.mpi`, respectively. Other makefiles are in these directories:

```
OPTIONS      # Makefiles which enable specific options
MACHINES     # Makefiles for specific machines
MINE         # customized Makefiles you create (you may need to create this folder)
```

Simply typing `make` lists all the available `Makefile.<machine>` files with a single line description toward the end of the output. A file with the same name can appear in multiple folders (not a good idea). The order the directories are searched is as follows: `src/MAKE/MINE`, `src/MAKE`, `src/MAKE/OPTIONS`, `src/MAKE/MACHINES`. This gives preference to a customized file you put in `src/MAKE/MINE`. If you create your own custom makefile under a new name, please edit the first line with the description and machine name, so you will not confuse yourself, when looking at the machine summary.

Makefiles you may wish to try out, include those listed below (some require a package first be installed). Many of these include specific compiler flags for optimized performance. Please note, however, that some of these customized machine Makefile are contributed by users, and thus may have modifications specific to the systems of those users. Since compilers, OS configurations, and LAMMPS itself keep changing, their settings may become outdated, too:

```
make mac      # build serial LAMMPS on macOS
make mac_mpi  # build parallel LAMMPS on macOS
make intel_cpu # build with the INTEL package optimized for CPUs
make opt      # build with the OPT package optimized for CPUs
make omp      # build with the OPENMP package optimized for OpenMP
```

3.4 Link LAMMPS as a library to another code

LAMMPS is designed as a library of C++ objects that can be integrated into other applications, including Python scripts. The files `src/library.cpp` and `src/library.h` define a C-style API for using LAMMPS as a library. See the [Library interface to LAMMPS](#) page for a description of the interface and how to use it for your needs.

The [Basic build options](#) page explains how to build LAMMPS as either a shared or static library. This results in a file in the compilation folder called `liblammps.a` or `liblammps_<name>.a` in case of building a static library. In case of a shared library, the name is the same only that the suffix is going to be either `.so` or `.dylib` or `.dll` instead of `.a` depending on the OS. In some cases, the `.so` file may be a symbolic link to a file with the suffix `.so.0` (or some other number).

Note

Care should be taken to use the same MPI library for the calling code and the LAMMPS library, unless LAMMPS is to be compiled without (real) MPI support using the included STUBS MPI library.

3.4.1 Link with LAMMPS as a static library

The calling application can link to LAMMPS as a static library with compilation and link commands, as in the examples shown below. These are examples for a code written in C in the file `caller.c`. The benefit of linking to a static library is, that the resulting executable is independent of that library since all required executable code from the library is copied into the calling executable.

CMake build

This assumes that LAMMPS has been configured without setting a `LAMMPS_MACHINE` name, installed with `make install`, and the `PKG_CONFIG_PATH` environment variable has been updated to include the `liblammps.pc` file installed into the configured destination folder. The commands to compile and link a coupled executable are then:

```
mpicc -c -O $(pkg-config --cflags liblammps) caller.c
mpicxx -o caller caller.o $(pkg-config --libs liblammps)
```

Traditional make

This assumes that LAMMPS has been compiled in the folder `${HOME}/lammps/src` with “make mpi”. The commands to compile and link a coupled executable are then:

```
mpicc -c -O -I${HOME}/lammps/src caller.c
mpicxx -o caller caller.o -L${HOME}/lammps/src -llammps_mpi
```

The `-I` argument is the path to the location of the `library.h` header file containing the interface to the LAMMPS C-style library interface. The `-L` argument is the path to where the `liblammps_mpi.a` file is located. The `-llammps_mpi` argument is shorthand for telling the compiler to link the file `liblammps_mpi.a`. If LAMMPS has been built as a shared library, then the linker will use `liblammps_mpi.so` instead. If both files are available, the linker will usually prefer the shared library. In case of a shared library, you may need to update the `LD_LIBRARY_PATH` environment variable or running the caller executable will fail since it cannot find the shared library at runtime.

However, it is only as simple as shown above for the case of a plain LAMMPS library without any optional packages that depend on libraries (bundled or external) or when using a shared library. Otherwise, you need to include all flags, libraries, and paths for the coupled executable, that are also required to link the LAMMPS executable.

CMake build

When using CMake, additional libraries with sources in the `lib` folder are built, but not included in `liblammps.a` and (currently) not installed with `make install` and not included in the `pkgconfig` configuration file. They can be found in the top level build folder, but you have to determine the necessary link flags manually. It is therefore recommended to either use the traditional make procedure to build and link with a static library or build and link with a shared library instead.

Traditional make

Changed in version 10Sep2025.

The traditional make build process no longer supports building packages that require extra build steps in the `lib` folder.

3.4.2 Link with LAMMPS as a shared library

When linking to LAMMPS built as a shared library, the situation becomes much simpler, as all dependent libraries and objects are either included in the shared library or registered as a dependent library in the shared library file. Thus, those libraries need not be specified when linking the calling executable. Only the `-I` flags are needed. So the example case from above of the serial version static LAMMPS library with the POEMS package installed becomes:

i CMake build

The commands with a shared LAMMPS library compiled with the CMake build process are the same as for the static library.

```
mpicc -c -O $(pkg-config --cflags liblammps) caller.c
mpicxx -o caller caller.o $(pkg-config --libs liblammps)
```

i Traditional make

The commands with a shared LAMMPS library compiled with the traditional make build using `make mode=shared serial` becomes:

```
gcc -c -O -I${HOME}/lammps/src caller.c
g++ -o caller caller.o -L${HOME}/lammps/src -llammps_serial
```

Locating liblammps.so at runtime

Unlike with a static link, now the `liblammps.so` file is required at runtime and needs to be in a folder, where the shared linker program of the operating system can find it. This would be either a folder like `/usr/local/lib64` or `${HOME}/.local/lib64` or a folder pointed to by the `LD_LIBRARY_PATH` environment variable. You can type

```
printenv LD_LIBRARY_PATH
```

to see what directories are in that list.

Or you can add the LAMMPS `src` directory or the directory you performed a CMake style build in to your `LD_LIBRARY_PATH` environment variable, so that the current version of the shared library is always available to programs that use it.

For the Bourne or Korn shells (`/bin/sh`, `/bin/ksh`, `/bin/bash` etc.), you would add something like this to your `${HOME}/.profile` file:

```
LD_LIBRARY_PATH=${LD_LIBRARY_PATH:-/usr/lib64}:${HOME}/lammps/src
export LD_LIBRARY_PATH
```

For the `csh` or `tcsh` shells, you would equivalently add something like this to your `${HOME}/.cshrc` file:

```
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

You can verify whether all required shared libraries are found with the `ldd` tool. Example:

```
LD_LIBRARY_PATH=/home/user/lammps/src ldd caller
linux-vdso.so.1 (0x00007ffe729e0000)
liblammps.so => /home/user/lammps/src/liblammps.so (0x00007fc91bb9e000)
libstdc++.so.6 => /lib64/libstdc++.so.6 (0x00007fc91b984000)
libm.so.6 => /lib64/libm.so.6 (0x00007fc91b83e000)
```

(continues on next page)

(continued from previous page)

```
libgcc_s.so.1 => /lib64/libgcc_s.so.1 (0x00007fc91b824000)
libc.so.6 => /lib64/libc.so.6 (0x00007fc91b65b000)
/lib64/ld-linux-x86-64.so.2 (0x00007fc91c094000)
```

If a required library is missing, you would get a ‘not found’ entry:

```
ldd caller
linux-vdso.so.1 (0x00007ffd672fe000)
liblammps.so => not found
libstdc++.so.6 => /usr/lib64/libstdc++.so.6 (0x00007fb7c7e86000)
libm.so.6 => /usr/lib64/libm.so.6 (0x00007fb7c7d40000)
libgcc_s.so.1 => /usr/lib64/libgcc_s.so.1 (0x00007fb7c7d26000)
libc.so.6 => /usr/lib64/libc.so.6 (0x00007fb7c7b5d000)
/lib64/ld-linux-x86-64.so.2 (0x00007fb7c80a2000)
```

3.5 Basic build options

The following topics are covered on this page, for building with both CMake and make:

- *Serial vs parallel build*
- *Choice of compiler and compile/link options*
- *Build the LAMMPS executable and library*
- *Including and removing debug support*
- *Install LAMMPS after a build*

3.5.1 Serial vs parallel build

LAMMPS is written to use the ubiquitous [MPI \(Message Passing Interface\)](#) library API for distributed memory parallel computation. You need to have such a library installed for building and running LAMMPS in parallel using a domain decomposition parallelization. It is compatible with the MPI standard version 2.x and later. LAMMPS can also be built into a “serial” executable for use with a single processor using the bundled MPI STUBS library.

Independent of the distributed memory MPI parallelization, parts of LAMMPS are also written with support for shared memory parallelization using the [OpenMP](#) threading standard. A more detailed discussion of that is below.

CMake build

```
-D BUILD_MPI=value      # yes or no, default is yes if CMake finds MPI
-D BUILD_OMP=value      # yes or no, default is yes if a compatible
                        # compiler is detected
-D LAMMPS_MACHINE=name  # name = mpi, serial, mybox, titan, laptop, etc
                        # no default value
```

The executable created by CMake (after running make) is named `lmp` unless the `LAMMPS_MACHINE` option is set. When setting `LAMMPS_MACHINE=name`, the executable will be called `lmp_name`. Using `BUILD_MPI=no` will enforce building a serial executable using the MPI STUBS library.

i Traditional make

The build with traditional makefiles has to be done inside the source folder `src`.

```
make mpi      # parallel build, produces lmp_mpi using Makefile.mpi
make serial   # serial build, produces lmp_serial using Makefile/serial
make mybox    # uses Makefile.mybox to produce lmp_mybox
```

Any `make machine` command will look up the make settings from a file `Makefile.machine` in the folder `src/MAKE` or one of its subdirectories `MINE`, `MACHINES`, or `OPTIONS`, create a folder `Obj_machine` with all objects and generated files and an executable called `lmp_machine`. The standard parallel build with `make mpi` assumes a standard MPI installation with MPI compiler wrappers where all necessary compiler and linker flags to get access and link with the suitable MPI headers and libraries are set by the wrapper programs. For other cases or the serial build, you have to adjust the make file variables `MPI_INC`, `MPI_PATH`, `MPI_LIB` as well as `CC` and `LINK`. To enable OpenMP threading usually a compiler specific flag needs to be added to the compile and link commands. For the GNU compilers, this is `-fopenmp`, which can be added to the `CC` and `LINK` makefile variables.

For the serial build the following make variables are set (see `src/MAKE/Makefile.serial`):

```
CC =      g++
LINK =    g++
MPI_INC = -I../STUBS
MPI_PATH = -L../STUBS
MPI_LIB = -lmpi_stubs
```

You also need to build the STUBS library for your platform before making LAMMPS itself. A `make serial` build does this for you automatically, otherwise, type `make mpi-stubs` from the `src` directory, or `make` from the `src/STUBS` dir. If the build fails, you may need to edit the `STUBS/Makefile` for your platform. The stubs library does not provide MPI/IO functions required by some LAMMPS packages, e.g. LATBOLTZ, and thus is not compatible with those packages.

i Note

The file `src/STUBS/mpi.cpp` provides a CPU timer function called `MPI_Wtime()` that calls `gettimeofday()`. If your operating system does not support `gettimeofday()`, you will need to insert code to call another timer. Note that the ANSI-standard function `clock()` rolls over after an hour or so, and is therefore insufficient for timing long LAMMPS simulations.

MPI and OpenMP support in LAMMPS

If you are installing MPI yourself to build a parallel LAMMPS executable, we recommend either MPICH or OpenMPI, which are regularly used and tested with LAMMPS by the LAMMPS developers. MPICH can be downloaded from the [MPICH home page](#), and OpenMPI can be downloaded correspondingly from the [OpenMPI home page](#). Other MPI packages should also work. No specific vendor provided and standard compliant MPI library is currently known to be incompatible with LAMMPS. If you are running on a large parallel machine, your system admins or the vendor should have already installed a version of MPI, which is likely to be faster than a self-installed MPICH or OpenMPI, so you should study the provided documentation to find out how to build and link with it.

The majority of OpenMP (threading) support in LAMMPS is provided by the OPENMP package; see the [OPENMP package](#) page for details. The INTEL package also includes OpenMP threading (it is compatible with OPENMP and will usually fall back on styles from that package, if a INTEL does not exist) and adds vectorization support when compiled with compatible compilers, in particular the Intel compilers on top of OpenMP. Also, the KOKKOS package can be compiled to include OpenMP threading.

In addition, there are a few commands in LAMMPS that have native OpenMP support included as well. These are

commands in the ML-SNAP, DIFFRACTION, and DPD-REACT packages. Furthermore, some packages support OpenMP threading indirectly through the libraries they interface to: e.g. KSPACE, and COLVARS. See the [Packages details](#) page for more info on these packages, and the pages for their respective commands for OpenMP threading info.

For CMake, if you use BUILD_OMP=yes, you can use these packages and turn on their native OpenMP support at run time by setting the OMP_NUM_THREADS environment variable before you launch LAMMPS.

When building LAMMPS with conventional make, the CCFLAGS and LINKFLAGS variables in Makefile.machine need to include the compiler flag that enables OpenMP. For the GNU compilers or Clang, it is `-fopenmp`. For (recent) Intel compilers, it is `-qopenmp`. If you are using a different compiler, please refer to its documentation.

OpenMP Compiler compatibility

Some compilers do not fully support the `default(none)` directive and others (e.g. GCC version 9 and beyond, Clang version 10 and later) may implement strict OpenMP 4.0 and later semantics, which are incompatible with the OpenMP 3.1 semantics used in LAMMPS for maximal compatibility with compiler versions in use. If compilation with OpenMP enabled fails because of your compiler requiring strict OpenMP 4.0 semantics, you can change the behavior by adding `-D LAMMPS_OMP_COMPAT=4` to the `LMP_INC` variable in your makefile, or add it to the command-line flags while configuring with CMake. LAMMPS will auto-detect a suitable setting for most GNU, Clang, and Intel compilers.

3.5.2 Choice of compiler and compile/link options

The choice of compiler and compiler flags can be important for maximum performance. Vendor provided compilers for a specific hardware can produce faster code than open-source compilers like the GNU compilers. On the most common x86 hardware, the most popular C++ compilers are quite similar in their ability to optimize regular C/C++ source code at high optimization levels. When using the INTEL package, there is a distinct advantage in using the [Intel C++ compiler](#) due to much improved vectorization through SSE and AVX instructions on compatible hardware. The source code in that package conditionally includes compiler specific directives to enable these high degrees of vectorization. This may change over time as equivalent vectorization directives are included into the OpenMP standard and other compilers adopt them.

On parallel clusters or supercomputers which use “environment modules” for their compile/link environments, you can often access different compilers by simply loading the appropriate module before building LAMMPS.

CMake build

By default CMake will use the compiler it finds according to its internal preferences, and it will add optimization flags appropriate to that compiler and any [accelerator packages](#) you have included in the build. CMake will check if the detected or selected compiler is compatible with the C++ support requirements of LAMMPS and stop with an error, if this is not the case. A C++17 compatible compiler is required.

You can tell CMake to look for a specific compiler with setting CMake variables (listed below) during configuration. For a few common choices, there are also presets in the `cmake/presets` folder. You may also specify the corresponding `CMAKE_*_FLAGS` variables individually, if you want to experiment with alternate optimization flags. You should specify all 3 compilers, so that the (few) LAMMPS source files written in C or Fortran are built with a compiler consistent with the one used for the C++ files:

```
-D CMAKE_CXX_COMPILER=name           # name of C++ compiler
-D CMAKE_C_COMPILER=name             # name of C compiler
-D CMAKE_Fortran_COMPILER=name        # name of Fortran compiler

-D CMAKE_CXX_STANDARD=17             # put compiler in C++17 mode
-D CMAKE_CXX_FLAGS=string             # flags to use with C++ compiler
-D CMAKE_C_FLAGS=string               # flags to use with C compiler
-D CMAKE_Fortran_FLAGS=string         # flags to use with Fortran compiler
```

A few example command lines are:

Building with GNU Compilers:

```
cmake -DCMAKE_C_COMPILER=gcc -DCMAKE_CXX_COMPILER=g++ \
      -DCMAKE_Fortran_COMPILER=gfortran ../cmake
```

Building with Intel Classic Compilers:

```
cmake -DCMAKE_C_COMPILER=icc -DCMAKE_CXX_COMPILER=icpc \
      -DCMAKE_Fortran_COMPILER=ifort ../cmake
```

Building with Intel oneAPI Compilers:

```
cmake -DCMAKE_C_COMPILER=icx -DCMAKE_CXX_COMPILER=icpx \
      -DCMAKE_Fortran_COMPILER=ifx ../cmake
```

Building with LLVM/Clang Compilers:

```
cmake -DCMAKE_C_COMPILER=clang -DCMAKE_CXX_COMPILER=clang++ \
      -DCMAKE_Fortran_COMPILER=flang ../cmake
```

Building with PGI/Nvidia Compilers:

```
cmake -DCMAKE_C_COMPILER=pgcc -DCMAKE_CXX_COMPILER=pgc++ \
      -DCMAKE_Fortran_COMPILER=pgfortran ../cmake
```

Building with the NVHPC Compilers:

```
cmake -DCMAKE_C_COMPILER=nvc -DCMAKE_CXX_COMPILER=nvc++ \
      -DCMAKE_Fortran_COMPILER=nvfortran ../cmake
```

For compiling with the Clang/LLVM compilers a CMake preset is provided that can be loaded with `-C ../cmake/presets/clang.cmake`. Similarly, `-C ../cmake/presets/intel.cmake` should switch the compiler tool chain to the legacy Intel compilers, `-C ../cmake/presets/oneapi.cmake` will switch to the LLVM based oneAPI Intel compilers, `-C ../cmake/presets/pgi.cmake` will switch the compiler to the PGI compilers, and `-C ../cmake/presets/nvhpc.cmake` will switch to the NVHPC compilers.

Note

When the cmake command completes, it prints a summary to the screen which compilers it is using and what flags and settings will be used for the compilation. Note that if the top-level compiler is `mpicxx`, it is simply a wrapper on a real compiler. The underlying compiler info is what CMake will try to determine and report. You should check to confirm you are using the compiler and optimization flags you want.

Makefile.machine settings for traditional make

The “compiler/linker settings” section of a `Makefile.machine` lists compiler and linker settings for your C++ compiler, including optimization flags. For a parallel build it is recommended to use `mpicxx` or `mpiCC`, since these compiler wrappers will include a variety of settings appropriate for your MPI installation and thus avoiding the guesswork of finding the right flags.

Parallel build (see `src/MAKE/Makefile.mpi`):

```
CC =      mpicxx
CFLAGS =  -g -O3
LINK =    mpicxx
LINKFLAGS = -g -O
```

Serial build with GNU gcc (see `src/MAKE/Makefile.serial`):

```
CC =      g++
CCFLAGS = -g -O3
LINK =    g++
LINKFLAGS = -g -O
```

Note

If compilation stops with a message like the following:

```
g++ -g -O3 -DLAMMPS_GZIP -DLAMMPS_MEMALIGN=64 -I../STUBS -c ../
↳main.cpp
In file included from ../pointers.h:24:0,
               from ../input.h:17,
               from ../main.cpp:16:
../lmptype.h:34:2: error: #error LAMMPS requires a C++17 (or later)
↳compliant compiler. Enable C++17 compatibility or upgrade the compiler.
```

then you have either an unsupported (old) compiler or you have to turn on C++17 mode. For those compilers, you need to add the `-std=c++17` flag. If there is no compiler that supports this flag (or equivalent), you would have to install a newer compiler that supports C++17; either as a binary package or through compiling from source.

If you build LAMMPS with any *Accelerator packages* included, there may be specific compiler or linker flags that are either required or recommended to enable required features and to achieve optimal performance. You need to include these in the CCFLAGS and LINKFLAGS settings above. For details, see the documentation for the individual packages listed on the *Accelerator packages* page. Or examine these files in the `src/MAKE/OPTIONS` directory. They correspond to each of the 5 accelerator packages and their hardware variants:

Makefile.opt	# OPT package
Makefile.omp	# OPENMP package
Makefile.intel_cpu	# INTEL package for CPUs
Makefile.gpu	# GPU package

3.5.3 Build the LAMMPS executable and library

LAMMPS is always built as a library of C++ classes plus an executable. The executable is a simple `main()` function that sets up MPI and then creates a LAMMPS class instance from the LAMMPS library, which will then process commands provided via a file or from the console input. The LAMMPS library can also be called from another application or a scripting language. See the *Howto couple* doc page for more info on coupling LAMMPS to other codes. See the *Python* page for more info on wrapping and running LAMMPS from Python via its library interface.

CMake build

For CMake builds, you can select through setting CMake variables between building a shared or a static LAMMPS library and what kind of suffix is added to them (in case you want to concurrently install multiple variants of binaries with different settings). If none are set, defaults are applied.

```
-D BUILD_SHARED_LIBS=value  # yes or no (default)
-D LAMMPS_MACHINE=name     # name = mpi, serial, mybox, titan, laptop, etc
                           # no default value
```

The compilation will always produce a LAMMPS library and an executable linked to it. By default, this will be a static library named `liblammmps.a` and an executable named `lmp`. Setting `BUILD_SHARED_LIBS=yes` will instead produce a shared library called `liblammmps.so` (or `liblammmps.dylib` or `liblammmps.dll` depending on the platform). If `LAMMPS_MACHINE=name` is set in addition, the name of the generated libraries will be changed to either `liblammmps_name.a` or `liblammmps_name.so`, respectively and the executable will be called `lmp_name`.

Traditional make

With the traditional makefile based build process, the choice of the generated executable or library depends on the “mode” setting. Several options are available and `mode=static` is the default.

```
make machine           # build LAMMPS executable lmp_machine
make mode=static machine # same as "make machine"
make mode=shared machine # build LAMMPS shared lib liblammmps_machine.so
                        # instead
```

The “static” build will generate a static library called `liblammmps_machine.a` and an executable named `lmp_machine`, while the “shared” build will generate a shared library `liblammmps_machine.so` instead and `lmp_machine` will be linked to it. The build step will also create generic soft links, named `liblammmps.a` and `liblammmps.so`, which point to the specific `liblammmps_machine.a/so` files.

Additional information

Note that for creating a shared library, all the libraries it depends on must be compiled to be compatible with shared libraries. This should be the case for libraries included with LAMMPS, such as the dummy MPI library in `src/STUBS` or any package libraries in the `lib` directory, since they are always built in a shared library compatible way using the `-fPIC` compiler switch. However, if an auxiliary library (like MPI or FFTW) does not exist as a compatible format, the shared library linking step may generate an error. This means you will need to install a compatible version of the auxiliary library. The build instructions for that library should tell you how to do this.

As an example, here is how to build and install the [MPICH library](#), a popular open-source version of MPI, as a shared library in the default `/usr/local/lib` location:

```
./configure --enable-shared
make
make install
```

You may need to use `sudo make install` in place of the last line if you do not have write privileges for `/usr/local/lib` or use the `--prefix` configuration option to select an installation folder, where you do have write access. The end result should be the file `/usr/local/lib/libmpich.so`. On many Linux installations, the folder `${HOME}/.local` is an alternative to using `/usr/local` and does not require superuser or `sudo` access. In that case the configuration step becomes:

```
./configure --enable-shared --prefix=${HOME}/.local
```

Avoiding the use of “sudo” for custom software installation (i.e. from source and not through a package manager tool provided by the OS) is generally recommended to ensure the integrity of the system software installation.

3.5.4 Including or removing debug support

By default the compilation settings will include the `-g` flag which instructs the compiler to include debug information (e.g. which line of source code a particular instruction correspond to). This can be extremely useful in case LAMMPS crashes and can help to provide crucial information in *tracking down the origin of a crash* and help the LAMMPS developers fix bugs in the source code. However, this increases the storage requirements for object files, libraries, and the executable 3-5 fold.

If this is a concern, you can change the compilation settings or remove the debug information from the LAMMPS executable:

- **Traditional make:** edit your Makefile.<machine> to remove the `-g` flag from the CCFLAGS and LINKFLAGS definitions
 - **CMake:** use `-D CMAKE_BUILD_TYPE=Release` or explicitly reset the applicable compiler flags (best done using the text mode or graphical user interface).
 - **Remove debug info:** If you are only concerned about the executable being too large, you can use the `strip` tool (e.g. `strip lmp_serial`) to remove the debug information from the executable file. Do not strip libraries or object files, as that will render them unusable.
-

3.5.5 Build LAMMPS tools

Some tools described in *Auxiliary tools* can be built directly using CMake or Make.

CMake build

```
-D BUILD_TOOLS=value      # yes or no (default). Build binary2txt,  
                          # chain.x, micelle2d.x, msi2lmp, phana,  
                          # stl_bin2txt  
-D BUILD_LAMMPS_GUI=value # yes or no (default). Build LAMMPS-GUI  
-D BUILD_WHAM=value       # yes (default). Download and build WHAM;  
                          # only available for BUILD_LAMMPS_GUI=yes
```

The generated binaries will also become part of the LAMMPS installation (see below).

Traditional make

```
cd lammps/tools  
make all           # build all binaries of tools  
make binary2txt    # build only binary2txt tool  
make chain         # build only chain tool  
make micelle2d     # build only micelle2d tool
```

Note

Building LAMMPS-GUI *requires* building LAMMPS with CMake.

3.5.6 Install LAMMPS after a build

After building LAMMPS, you may wish to copy the LAMMPS executable or library, along with other LAMMPS files (library header, doc files), to a globally visible place on your system, for others to access. Note that you may need super-user privileges (e.g. `sudo`) if the directory you want to copy files to is protected.

CMake build

```
cmake -D CMAKE_INSTALL_PREFIX=path [options ...] ../cmake
make                                     # perform make after CMake command
make install                           # perform the installation into prefix
```

During the installation process CMake will by default remove any runtime path settings for loading shared libraries. Because of this you may have to set or modify the `LD_LIBRARY_PATH` (or `DYLD_LIBRARY_PATH`) environment variable, if you are installing LAMMPS into a non-system location and/or are linking to libraries in a non-system location that depend on such runtime path settings. As an alternative, you may set the CMake variable `LAMMPS_INSTALL_RPATH` to `on` and then the runtime paths for any linked shared libraries and the library installation folder for the LAMMPS library will be embedded and thus the requirement to set environment variables is avoided. The `off` setting is usually preferred for packaged binaries or when setting up environment modules, the `on` setting is more convenient for installing software into a non-system or personal folder.

Traditional make

There is no “install” option in the `src/Makefile` for LAMMPS. If you wish to do this you will need to first build LAMMPS, then manually copy the desired LAMMPS files to the appropriate system directories.

3.6 Optional build settings

LAMMPS can be built with several optional settings. Each subsection explains how to do this for building both with CMake and make.

- *C++17 standard compliance* when building all of LAMMPS
 - *FFT library* for use with the *kspace_style ppm* command
 - *Size of LAMMPS integer types and size limits*
 - *Read or write compressed files*
 - *Support for downloading files from the input*
 - *Prevent download of large potential files*
 - *Memory allocation alignment*
 - *Workaround for long long integers*
 - *Exception handling when using LAMMPS as a library* to capture errors
-

3.6.1 C++17 standard compliance

Changed in version 10Sep2025.

A C++17 standard compatible compiler is currently the minimum requirement for compiling LAMMPS. LAMMPS version 22 July 2025 is the last version compatible with the C++11 standard for the core code and most packages. Most currently used C++ compilers are compatible with C++17, but some older ones may need extra flags to enable C++17 compliance.

```
CCFLAGS = -g -O3 -std=c++17
```

Individual packages may require compliance with a later C++ standard like C++20. These requirements will be documented with the *individual packages*.

3.6.2 FFT library

When the KSPACE package is included in a LAMMPS build, the *kspace_style ppm* command performs 3d FFTs which require use of an FFT library to compute 1d FFTs. The KISS FFT library is included with LAMMPS, but other libraries can be faster. LAMMPS can use them if they are available on your system.

Added in version 7Feb2024.

Alternatively, LAMMPS can use the *heFFTe* library for the MPI communication algorithms, which comes with many optimizations for special cases, e.g. leveraging available 2D and 3D FFTs in the back end libraries and better pipelining for packing and communication.

CMake build

```
-D FFT=value           # FFTW3 or MKL or NVPL or KISS,  
                        # default is FFTW3 if found, else KISS  
-D FFT_KOKKOS=value    # FFTW3 or MKL or NVPL or KISS or CUFFT  
                        # or HIPFFT or MKL_GPU, default is KISS  
-D FFT_SINGLE=value    # yes or no (default), no = double precision
```

```
-D FFT_PACK=value      # array (default) or pointer or memcpy
-D FFT_USE_HEFFTE=value # yes or no (default), yes links to heFFTe
```

Note

When the Kokkos variant of a package is compiled and selected at run time, the FFT library selected by the FFT_KOKKOS variable applies. Otherwise, the FFT library selected by the FFT variable applies. The same FFT settings apply to both. FFT_KOKKOS must be compatible with the Kokkos back end - for example, when using the CUDA back end of Kokkos, you must use either CUFFT or KISS.

Usually these settings are all that is needed. If FFTW3 is selected, then CMake will try to detect, if threaded FFTW libraries are available and enable them by default. This setting is independent of whether OpenMP threads are enabled and a package like KOKKOS or OPENMP is used. If CMake cannot detect the FFT library, you can set these variables to assist:

```
-D FFTW3_INCLUDE_DIR=path # path to FFTW3 include files
-D FFTW3_LIBRARY=path     # path to FFTW3 libraries
-D FFTW3_OMP_LIBRARY=path # path to FFTW3 OpenMP wrapper libraries
-D FFT_FFTW_THREADS=on    # enable using OpenMP threaded FFTW3 libraries
-D MKL_INCLUDE_DIR=path   # ditto for Intel MKL library
-D FFT_MKL_THREADS=on     # enable using threaded FFTs with MKL libraries
-D MKL_LIBRARY=path       # path to MKL libraries
-D FFT_HEFFTE_BACKEND=value # FFTW or MKL or empty/undefined for the stock
                           # heFFTe back end
-D Heffte_ROOT=path       # path to an existing heFFTe installation
-D nvpl_fft_INCLUDE_DIR=path # path to NVPL FFT include files
-D nvpl_fft_LIBRARY_DIR=path # path to NVPL FFT libraries
```

Note

heFFTe comes with a builtin (= stock) back end for FFTs, i.e. a default internal FFT implementation; however, this stock back end is intended for testing purposes only and is not optimized for production runs.

Traditional make

To change the FFT library to be used and its options, you have to edit your machine Makefile. Below are examples how the makefile variables could be changed.

```
FFT_INC = -DFFT_<NAME>      # where <NAME> is KISS (default), FFTW3,
                           # FFTW (same as FFTW3), NVPL, or MKL
FFT_INC = -DFFT_KOKKOS_<NAME> # where <NAME> is KISS (default), FFTW3,
                           # FFTW (same as FFTW3), NVPL, MKL, CUFFT,
                           # HIPFFT, or MKL_GPU
FFT_INC = -DFFT_SINGLE      # do not specify for double precision
FFT_INC = -DFFT_FFTW_THREADS # enable using threaded FFTW3 libraries
FFT_INC = -DFFT_MKL_THREADS  # enable using threaded FFTs with MKL libraries
FFT_INC = -DFFT_PACK_ARRAY   # or -DFFT_PACK_POINTER or -DFFT_PACK_MEMCPY
                           # default is FFT_PACK_ARRAY if not specified

FFT_INC = -I/usr/local/include
```

```
FFT_PATH = -L/usr/local/lib

# hipFFT either precision
FFT_LIB = -lhipfft

# cuFFT either precision
FFT_LIB = -lcufft

# MKL_GPU either precision
FFT_LIB = -lmkl_sycl_dft -lmkl_intel_ilp64 -lmkl_tbb_thread -lmkl_core -ltbb

# FFTW3 double precision
FFT_LIB = -lfftw3

# FFTW3 double precision with threads (needs -DFFT_FFTW_THREADS)
FFT_LIB = -lfftw3 -lfftw3_omp

# FFTW3 single precision
FFT_LIB = -lfftw3 -lfftw3f

# serial MKL with Intel compiler
FFT_LIB = -lmkl_intel_lp64 -lmkl_sequential -lmkl_core

# serial MKL with GNU compiler
FFT_LIB = -lmkl_gf_lp64 -lmkl_sequential -lmkl_core

# threaded MKL with Intel compiler
FFT_LIB = -lmkl_intel_lp64 -lmkl_intel_thread -lmkl_core

# threaded MKL with GNU compiler
FFT_LIB = -lmkl_gf_lp64 -lmkl_gnu_thread -lmkl_core

# MKL with automatic runtime selection of interface libs
FFT_LIB = -lmkl_rt

# threaded NVPL FFT
FFT_LIB = -lnvpl_fftw
```

As with CMake, you do not need to set paths in `FFT_INC` or `FFT_PATH`, if the compiler can find the FFT header and library files in its default search path. You must specify `FFT_LIB` with the appropriate FFT libraries to include in the link.

Traditional make can also link to heFFTe using an existing installation

```
include <path-to-heffte-installation>/share/heffte/HeffteMakefile.in
FFT_INC = -DFFT_HEFFTE -DFFT_HEFFTE_FFTW $(heffte_include)
FFT_PATH =
FFT_LIB = $(heffte_link) $(heffte_libs)
```

The heFFTe install path will contain `HeffteMakefile.in`, which will define the `heffte_` include variables needed to link to heFFTe from an external project using traditional make. The `-DFFT_HEFFTE` is required to switch to using heFFTe, while the optional `-DFFT_HEFFTE_FFTW` selects the desired heFFTe back end, e.g., `-DFFT_HEFFTE_FFTW` or `-DFFT_HEFFTE_MKL`, omitting the variable will default to the *stock* back end. The heFFTe *stock* back end is intended to be used for testing and debugging,

but is not performance optimized for large scale production runs.

The **KISS FFT library** is included in the LAMMPS distribution. It is portable across all platforms. Depending on the size of the FFTs and the number of processors used, the other libraries listed here can be faster.

However, note that long-range Coulombics are only a portion of the per-timestep CPU cost, FFTs are only a portion of long-range Coulombics, and 1d FFTs are only a portion of the FFT cost (parallel communication can be costly). A breakdown of these timings is printed to the screen at the end of a run when using the *kpspace_style pppm* command. The *Screen and logfile output* page gives more details. A more detailed (and time consuming) report of the FFT performance is generated with the *kpspace_modify fftbench yes* command.

FFTW is a fast, portable FFT library that should also work on any platform and can be faster than the KISS FFT library. You can download it from www.fftw.org. LAMMPS requires version 3.X; the legacy version 2.1.X is no longer supported.

Building FFTW for your box should be as simple as `./configure; make; make install`. The install command typically requires root privileges (e.g. invoke it via `sudo`), unless you specify a local directory with the `--prefix` option of `configure`. Type `./configure --help` to see various options.

The Intel MKL math library is part of the Intel compiler suite. It can be used with the Intel or GNU compiler (see the `FFT_LIB` setting above).

The NVIDIA Performance Libraries (NVPL) FFT library is optimized for NVIDIA Grace Armv9.0 architecture. You can download it from <https://docs.nvidia.com/nvpl/>

The cuFFT and hipFFT FFT libraries are packaged with NVIDIA's CUDA and AMD's HIP installations, respectively. These FFT libraries require the Kokkos acceleration package to be enabled and the Kokkos back end to be GPU-resident (i.e., HIP or CUDA). Similarly, GPU offload of FFTs on Intel GPUs with oneMKL currently requires the Kokkos acceleration package to be enabled with the SYCL back end.

Performing 3d FFTs in parallel can be time-consuming due to data access and required communication. This cost can be reduced by performing single-precision FFTs instead of double precision. Single precision means the real and imaginary parts of a complex datum are 4-byte floats. Double precision means they are 8-byte doubles. Note that Fourier transform and related PPPM operations are somewhat less sensitive to floating point truncation errors, and thus the resulting error is generally less than the difference in precision. Using the `-DFFT_SINGLE` setting trades off a little accuracy for reduced memory use and parallel communication costs for transposing 3d FFT data.

When using `-DFFT_SINGLE` with FFTW3, you may need to ensure that the FFTW3 installation includes support for single-precision.

When compiling FFTW3 from source, you can do the following, which should produce the additional libraries `libfftw3f.a` and `libfftw3f.so`.

```
make clean
./configure --enable-single; make; make install
```

Performing 3d FFTs requires communication to transpose the 3d FFT grid. The data packing/unpacking for this can be done in one of 3 modes (ARRAY, POINTER, MEMCPY) as set by the `FFT_PACK` syntax above. Depending on the machine, the size of the FFT grid, the number of processors used, one option may be slightly faster. The default is ARRAY mode.

When using `-DFFT_HEFFTE` CMake will first look for an existing install with hints provided by `-DHeffte_ROOT`, as recommended by the CMake standard and note that the name is case sensitive. If CMake cannot find a heFFTe installation with the correct back end (e.g., FFTW or MKL), it will attempt to download and build the library automatically. In this case, LAMMPS CMake will also accept all heFFTe specific variables listed in the [heFFTe documentation](#) and those variables will be passed into the heFFTe build.

3.6.3 Size of LAMMPS integer types and size limits

LAMMPS uses a few custom integer data types, which can be defined as either 4-byte (= 32-bit) or 8-byte (= 64-bit) integers at compile time. This has an impact on the size of a system that can be simulated, or how large counters can become before “rolling over”. The default setting of “smallbig” is almost always adequate.

i CMake build

With CMake the choice of integer types is made via setting a variable during configuration.

```
-D LAMMPS_SIZES=value    # smallbig (default) or bigbig
```

If the variable is not set explicitly, “smallbig” is used.

i Traditional build

If you want a setting different from the default, you need to edit the LMP_INC variable setting your machine Makefile.

```
LMP_INC = -DLAMMPS_SMALLBIG    # or -DLAMMPS_BIGBIG
```

The default setting is -DLAMMPS_SMALLBIG if nothing is specified

LAMMPS system size restrictions

	smallbig	bigbig
Total atom count	2^{63} atoms ($= 9.223 \cdot 10^{18}$)	2^{63} atoms ($= 9.223 \cdot 10^{18}$)
Total timesteps	2^{63} steps ($= 9.223 \cdot 10^{18}$)	2^{63} steps ($= 9.223 \cdot 10^{18}$)
Atom ID values	$1 \leq i \leq 2^{31}$ ($= 2.147 \cdot 10^9$)	$1 \leq i \leq 2^{63}$ ($= 9.223 \cdot 10^{18}$)
Image flag values	$-512 \leq i \leq 511$	$-1\,048\,576 \leq i \leq 1\,048\,575$

The “bigbig” setting increases the size of image flags and atom IDs over the default “smallbig” setting.

These are limits for the core of the LAMMPS code, specific features or some styles may impose additional limits. Also, there are limitations when using the library interface where some functions with known issues have been replaced by dummy calls printing a corresponding error message rather than crashing randomly or corrupting data.

Atom IDs are not required for atomic systems which do not store bond topology information, though IDs are enabled by default. The *atom_modify id no* command will turn them off. Atom IDs are required for molecular systems with bond topology (bonds, angles, dihedrals, etc). Similarly, some force or compute or fix styles require atom IDs. Thus, if you model a molecular system or use one of those styles with more than 2 billion atoms, you need the “bigbig” setting.

Regardless of the total system size limits, the maximum number of atoms per MPI rank (local + ghost atoms) is limited to 2 billion for atomic systems and 500 million for systems with bonds (the additional restriction is due to using the 2 upper bits of the local atom index in neighbor lists for storing special bonds info).

Image flags store 3 values per atom in a single integer, which count the number of times an atom has moved through the periodic box in each dimension. See the *dump* manual page for a discussion. If an atom moves through the periodic box more than this limit, the value will “roll over”, e.g. from 511 to -512, which can cause diagnostics like the mean-squared displacement, as calculated by the *compute msd* command, to be faulty.

Also note that the GPU package requires its lib/gpu library to be compiled with the same size setting, or the link will fail. A CMake build does this automatically. When building with make, the setting in whichever lib/gpu/Makefile is used must be the same as above.

3.6.4 Read or write compressed files

Changed in version 11Feb2026: Added support for brotli and 7-zip

If this option is enabled, large files can be read or written with compression by `gzip` or similar tools by several LAMMPS commands, including `read_data`, `write_data`, `rerun`, `dump`, and `write_dump`. Supported compression tools and algorithms are currently `gzip`, `bzip2`, `zstd`, `xz`, `lz4`, `lzma` (via `xz`), `brotli`, and `7-zip` (via `7z`). LAMMPS checks at runtime, which compression commands are available and adjusts the check for supported suffixes accordingly. The list of available compression formats and suffixes is shown when running LAMMPS with the *-help or -h command_line flag*.

i CMake build

```
-D WITH_GZIP=value    # yes or no
                     # default is yes if CMake can find the gzip program
```

i Traditional make

```
LMP_INC = -DLAMMPS_GZIP  <other LMP_INC settings>
```

This option requires that your operating system fully supports the “`popen()`” function in the standard runtime library and that a `gzip` or other executable can be found by LAMMPS in the standard search path during a run.

i Note

On clusters with high-speed networks, using the “`fork()`” library call (required by “`popen()`”) can interfere with the fast communication library and lead to simulations using compressed output or input to hang or crash. For selected operations, compressed file I/O is also available using a compression library instead, which is what the *COMPRESS package* provides.

3.6.5 Support for downloading files from the input

Added in version 29Aug2024.

The *geturl command* uses the *libcurl library* to download files. This requires that LAMMPS is compiled accordingly which needs the following settings:

i CMake build

```
-D WITH_CURL=value    # yes or no
                     # default = yes if CMake finds CURL development_
→files, else no
```

Usually these settings are all that is needed. If CMake cannot find the graphics header, library, executable files, you can set these variables:

```
-D CURL_INCLUDE_DIR=path  # path to folder which contains curl.h header_
→file
-D CURL_LIBRARY=path     # path to libcurls.a (.so) file
```

i Traditional make

```
LMP_INC = -DLAMMPS_CURL <other LMP_INC settings>

CURL_INC = -I/usr/local/include # path to curl folder with curl.h
CURL_PATH = -L/usr/lib         # paths to libcurl.a(.so) if make cannot
→ find it
CURL_LIB = -lcurl              # library names
```

As with CMake, you do not need to set CURL_INC or CURL_PATH, if make can find the libcurl header and library files in their default system locations. You must specify CURL_LIB with a paths or linker flags to link to libcurl.

3.6.6 Prevent download of large potential files

Added in version 8Feb2023.

LAMMPS bundles a selection of potential files in the `potentials` folder as examples of how those kinds of potential files look like and for use with the provided input examples in the `examples` tree. To keep the size of the distributed LAMMPS source package small, very large potential files (> 5 MBytes) are not bundled, but only downloaded on demand when the *corresponding package* is installed. This automatic download can be prevented when *building LAMMPS with CMake* by adding the setting `-D DOWNLOAD_POTENTIALS=off` when configuring.

3.6.7 Memory allocation alignment

This setting enables the use of the `posix_memalign()` call instead of `malloc()` when LAMMPS allocates large chunks of memory. Vector instructions on CPUs may become more efficient, if dynamically allocated memory is aligned on larger-than-default byte boundaries. On most current operating systems, the `malloc()` implementation returns pointers that are aligned to 16-byte boundaries. Using SSE vector instructions efficiently, however, requires memory blocks being aligned on 64-byte boundaries.

i CMake build

```
-D LAMMPS_MEMALIGN=value # 0, 8, 16, 32, 64 (default)
```

Use a LAMMPS_MEMALIGN value of 0 to disable using `posix_memalign()` and revert to using the `malloc()` C-library function instead. When compiling LAMMPS for Windows systems, `malloc()` will always be used and this setting is ignored.

i Traditional make

```
LMP_INC = -DLAMMPS_MEMALIGN=value # 8, 16, 32, 64
```

Do not set `-DLAMMPS_MEMALIGN`, if you want to have memory allocated with the `malloc()` function call instead. `-DLAMMPS_MEMALIGN` **cannot** be used on Windows, as Windows different function calls with different semantics for allocating aligned memory, that are not compatible with how LAMMPS manages its dynamical memory.

3.6.8 Workaround for long long integers

If your system or MPI version does not recognize “long long” data types, the following setting will be needed. It converts “long long” to a “long” data type, which should be the desired 8-byte integer on those systems:

i CMake build

```
-D LAMMPS_LONGLONG_TO_LONG=value      # yes or no (default)
```

i Traditional make

```
LMP_INC = -DLAMMPS_LONGLONG_TO_LONG <other LMP_INC settings>
```

3.6.9 Exception handling when using LAMMPS as a library

LAMMPS errors do not kill the calling code, but throw an exception. In the C-library interface, the call stack is unwound and control returns to the caller, e.g. to Python or a code that is coupled to LAMMPS. The error status can then be queried. When using C++ directly, the calling code has to be set up to *catch* exceptions thrown from within LAMMPS.

i Note

When LAMMPS is running in parallel, it is not always possible to cleanly recover from an exception since not all parallel ranks may throw an exception and thus other MPI ranks may get stuck waiting for messages from the ones with errors.

3.7 Include packages in build

In LAMMPS, a package is a group of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. In the src directory, each package is a subdirectory with the package name in capital letters.

An overview of packages is given on the [Packages](#) doc page. Brief overviews of each package are on the [Packages details](#) page.

When building LAMMPS, you can choose to include or exclude each package. Generally, there is no need to include a package if you never plan to use its features.

If you get a run-time error that a LAMMPS command or style is “unknown”, it is often because the command is contained in a package, and your build did not include that package. If the command or style *is* available in a package included in the LAMMPS distribution, the error message will indicate which package would be needed. Running LAMMPS with the *-h command-line switch* will print *all* optional commands and packages that were enabled when building that executable.

For the majority of packages, if you follow the single step below to include it, you can then build LAMMPS exactly the same as you would without any packages installed. A few packages may require additional steps, as explained on the [Build extras](#) page.

These links take you to the extra instructions for those select packages:

<i>ADIOS</i>	<i>APIP</i>	<i>COLVARS</i>	<i>COMPRESS</i>	<i>ELECTRODE</i>	<i>GPU</i>
<i>H5MD</i>	<i>INTEL</i>	<i>KIM</i>	<i>KOKKOS</i>	<i>LEPTON</i>	<i>MACHDYN</i>
<i>MDI</i>	<i>MISC</i>	<i>ML-HDNNP</i>	<i>ML-IAP</i>	<i>ML-PACE</i>	<i>ML-POD</i>
<i>ML-QUIP</i>	<i>ML-RUNNER</i>	<i>MOLFILE</i>	<i>NETCDF</i>	<i>OPENMP</i>	<i>OPT</i>
<i>PLUMED</i>	<i>PYTHON</i>	<i>QMMM</i>	<i>RHEO</i>	<i>SCAFACOS</i>	<i>VORONOI</i>
<i>VTk</i>					

The mechanism for including packages is simple but different for the CMake build system in comparison to the traditional make build.

i CMake build

```
-D PKG_NAME=value           # yes or no (default)
```

Examples:

```
-D PKG_MANYBODY=yes
-D PKG_INTEL=yes
```

All packages are included the same way. See the shortcut section below for how to install many packages at once with CMake.

i Note

If you switch between building with CMake and make builds, no packages in the src directory can be installed when you invoke cmake. CMake will give an error if that is not the case, indicating how you can uninstall all packages in the src dir.

i Traditional make

```
cd lammps/src
make ps           # check which packages are currently installed
make yes-name     # install a package with name
make no-name      # uninstall a package with name
make mpi          # build LAMMPS with whatever packages are now installed
```

Examples:

```
make no-rigid
make yes-intel
```

All packages are included the same way. See the shortcut section below for how to install many packages at once with make.

i Note

You must always re-build LAMMPS (via make) after installing or uninstalling a package, for the action to take effect. The included dependency tracking will make certain only files that are required to be rebuilt are recompiled.

Note

You cannot install or uninstall packages and build LAMMPS in a single make command with multiple targets, e.g. `make yes-colloid mpi`. This is because the make procedure creates a list of source files that will be out-of-date for the build if the package configuration changes within the same command. You can include or exclude multiple packages in a single make command, e.g. `make yes-colloid no-manybody`.

3.7.1 Information for both build systems

Almost all packages can be included or excluded in a LAMMPS build, independent of the other packages. However, some packages include files derived from files in other packages. LAMMPS checks for this and does the right thing. Individual files are only included if their dependencies are already included. Likewise, if a package is excluded, other files dependent on that package are also excluded.

Note

By default **no** packages are installed. Prior to August 2018, however, if you downloaded a tarball, 3 packages (KSPACE, MANYBODY, MOLECULE) were pre-installed via the traditional make procedure in the `src` directory. That is no longer the case, so that CMake will build as-is without needing to first uninstall those packages. You can quickly include those packages (plus RIGID and GRAPHICS) by using the “basic” preset with CMake or make `yes-basic` with traditional make as discussed below.

3.7.2 CMake presets for installing many packages

Instead of specifying all the CMake options via the command-line, CMake allows initializing its settings cache using script files. These are regular CMake files which can manipulate and set CMake variables (which represent selected options), and can also contain control flow constructs for more complex operations.

LAMMPS includes several of these files to define configuration “presets”, similar to the options that exist for the Make based system. Using these files, you can enable/disable portions of the available packages in LAMMPS. If you need a custom preset, you can make a copy of one of them and modify it to suit your needs.

```
# enable just a few core packages (MOLECULE, KSPACE, MANYBODY, RIGID, GRAPHICS)
cmake -C ../cmake/presets/basic.cmake [OPTIONS] ../cmake

# enable most packages
cmake -C ../cmake/presets/most.cmake [OPTIONS] ../cmake

# enable packages which download sources or potential files
cmake -C ../cmake/presets/download.cmake [OPTIONS] ../cmake

# disable packages that do require extra libraries or tools
cmake -C ../cmake/presets/nolib.cmake [OPTIONS] ../cmake

# change settings to use the Clang compilers by default
cmake -C ../cmake/presets/clang.cmake [OPTIONS] ../cmake

# change settings to use the GNU compilers by default
```

(continues on next page)

(continued from previous page)

```

cmake -C ../cmake/presets/gcc.cmake      [OPTIONS] ../cmake

# change settings to use the Intel compilers by default
cmake -C ../cmake/presets/intel.cmake    [OPTIONS] ../cmake

# change settings to use the PGI compilers by default
cmake -C ../cmake/presets/pgi.cmake      [OPTIONS] ../cmake

# enable all packages
cmake -C ../cmake/presets/all_on.cmake   [OPTIONS] ../cmake

# disable all packages
cmake -C ../cmake/presets/all_off.cmake  [OPTIONS] ../cmake

# compile with MinGW cross-compilers
mingw64-cmake -C ../cmake/presets/mingw-cross.cmake [OPTIONS] ../cmake

# compile serial multi-arch binaries on macOS
cmake -C ../cmake/presets/macos-multiarch.cmake [OPTIONS] ../cmake

```

Presets that have names starting with “windows” are specifically for compiling LAMMPS *natively on Windows* and presets that have names starting with “kokkos” are specifically for selecting configurations for compiling LAMMPS with *KOKKOS*.

Note

Running cmake this way manipulates the CMake settings cache in your current build directory. You can combine multiple presets and options in a single cmake run, or change settings incrementally by running cmake with new flags. If you use a preset for selecting a set of compilers, it will reset all settings from previous CMake runs.

Example

```

# build LAMMPS with most commonly used packages, but then remove
# those requiring additional library or tools, but still enable
# GPU package and configure it for using CUDA. You can run.
mkdir build
cd build
cmake -C ../cmake/presets/most.cmake -C ../cmake/presets/nolib.cmake \
      -D PKG_GPU=on -D GPU_API=cuda ../cmake

# to add another package, say BODY to the previous configuration you can run:
cmake -D PKG_BODY=on .

# to reset the package selection from above to the default of no packages
# but leaving all other settings untouched. You can run:
cmake -C ../cmake/presets/all_off.cmake .

```

3.7.3 Make shortcuts for installing many packages

The following commands are useful for managing package source files and their installation when building LAMMPS via traditional make. Just type make in lammps/src to see a one-line summary.

These commands install/uninstall sets of packages:

```
make yes-all           # install all packages
make no-all           # check for changes and uninstall all packages
make no-installed      # only check and uninstall installed packages
make yes-basic         # install a few commonly used packages'
make no-basic         # remove a few commonly used packages'
make yes-most         # install most packages w/o libs'
make no-most         # remove most packages w/o libs'
```

which install/uninstall various sets of packages. Typing make package will list all the these commands.

Note

Installing or uninstalling a package for the make based build process works by simply copying files back and forth between the main source directory src and the subdirectories with the package name (e.g. src/KSPACE, src/MANYBODY), so that the files are included or excluded when LAMMPS is built. Only source files in the src folder will be compiled.

The following make commands help manage files that exist in both the src directory and in package subdirectories. You do not normally need to use these commands unless you are editing LAMMPS files or are updating LAMMPS via git.

Type make package-status or make ps to show which packages are currently installed. For those that are installed, it will list any files that are different in the src directory and package subdirectory.

Type make package-installed or make pi to show which packages are currently installed, without listing the status of packages that are not installed.

Type make package-update or make pu to overwrite src files with files from the package subdirectories if the package is installed. It should be used after the checkout has been *updated or changed with git*, this will only update the files in the package subdirectories, but not the copies in the src folder.

Type make package-overwrite to overwrite files in the package subdirectories with src files.

Type make package-diff to list all differences between pairs of files in both the source directory and the package directory.

3.8 Packages with extra build options

When building with some packages, additional steps may be required, in addition to

CMake build	Traditional make
<code>cmake -D PKG_NAME=yes</code>	<code>make yes-name</code>

as described on the [Build_package](#) page.

For a CMake build there may be additional optional or required variables to set.

Changed in version 10Sep2025.

The traditional build system with GNU make no longer supports packages that require extra steps in the `lammmps/lib` directory.

This is the list of packages that may require additional steps.

<i>ADIOS</i>	<i>APIP</i>	<i>COLVARS</i>	<i>COMPRESS</i>	<i>ELECTRODE</i>	<i>GRAPHICS</i>
<i>GPU</i>	<i>H5MD</i>	<i>INTEL</i>	<i>KIM</i>	<i>KOKKOS</i>	<i>LEPTON</i>
<i>MACHDYN</i>	<i>MBX</i>	<i>MDI</i>	<i>MISC</i>	<i>ML-HDNNP</i>	<i>ML-IAP</i>
<i>ML-PACE</i>	<i>ML-POD</i>	<i>ML-QUIP</i>	<i>ML-RUNNER</i>	<i>MOLFILE</i>	<i>NETCDF</i>
<i>OPENMP</i>	<i>OPT</i>	<i>PLUMED</i>	<i>PYTHON</i>	<i>QMMM</i>	<i>RHEO</i>
<i>SCAFACOS</i>	<i>VORONOI</i>	<i>VTK</i>			

3.8.1 COMPRESS package

To build with this package you must have the [zlib compression library](#) available on your system to build dump styles with a `/gz` suffix. There are also styles using the [Zstandard](#) library which have a `'/zstd'` suffix. The zstd library version must be at least 1.4. Older versions use an incompatible API and thus LAMMPS will fail to compile.

i CMake build

If CMake cannot find the zlib library or include files, you can set these variables:

```
-D ZLIB_INCLUDE_DIR=path      # path to zlib.h header file
-D ZLIB_LIBRARY=path          # path to libz.a (.so) file
```

Support for Zstandard compression is auto-detected and for that CMake depends on the [pkg-config](#) tool to identify the necessary flags to compile with this library, so the corresponding `libzstandard.pc` file must be in a folder where `pkg-config` can find it, which may require adding it to the `PKG_CONFIG_PATH` environment variable.

i Traditional make

Changed in version 10Sep2025.

The COMPRESS package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.2 GRAPHICS package

Added in version 11Feb2026: `dump image`, `dump movie` and supporting classes were moved to form the new GRAPHICS package together with several `fix graphics/...` styles.

The `dump image` command has options to output JPEG or PNG image files in addition to the default PPM format, and the `fix graphics/labels` can read images in JPEG or PNG format in addition to PPM format files. Likewise, the `dump movie` command outputs movie files in a variety of movie formats. Using these additional options requires the following settings:

i CMake build

```

-D WITH_JPEG=value      # yes or no
                        # default = yes if CMake finds JPEG development files,
                        →else no
-D WITH_PNG=value       # yes or no
                        # default = yes if CMake finds PNG and ZLIB
                        →development files,
                        # else no
-D WITH_FFMPEG=value    # yes or no
                        # default = yes if CMake can find ffmpeg, else no

```

Usually these settings are all that is needed. If CMake cannot find the graphics header, library, executable files, you can set these variables:

```

-D JPEG_INCLUDE_DIR=path # path to jpeglib.h header file
-D JPEG_LIBRARY=path     # path to libjpeg.a (.so) file
-D PNG_INCLUDE_DIR=path  # path to png.h header file
-D PNG_LIBRARY=path      # path to libpng.a (.so) file
-D ZLIB_INCLUDE_DIR=path # path to zlib.h header file
-D ZLIB_LIBRARY=path     # path to libz.a (.so) file
-D FFMPEG_EXECUTABLE=path # path to ffmpeg executable

```

i Traditional make

```

LMP_INC = -DLAMMPS_JPEG -DLAMMPS_PNG -DLAMMPS_FFMPEG <other LMP_INC_
→settings>

JPG_INC = -I/usr/local/include # path to jpeglib.h, png.h, zlib.h headers
                                # if make cannot find them
JPG_PATH = -L/usr/lib          # paths to libjpeg.a, libpng.a, libz.a (.so)
                                # files if make cannot find them
JPG_LIB = -ljpeg -lpng -lz     # library names

```

As with CMake, you do not need to set JPG_INC or JPG_PATH, if make can find the graphics header and library files in their default system locations. You must specify JPG_LIB with a list of graphics libraries to include in the link. You must make certain that the ffmpeg executable (or ffmpeg.exe on Windows) is in a directory where LAMMPS can find it at runtime; that is usually a directory list in your PATH environment variable.

Using ffmpeg to output movie files requires that your machine supports the “popen” function in the standard runtime library.

i Note

On some clusters with high-speed networks, using the fork() library call (required by popen()) can interfere with the fast communication library and lead to simulations using ffmpeg to hang or crash.

3.8.3 GPU package

To build with this package, you must choose options for precision and which GPU hardware to build for. The GPU package currently supports three different types of back ends: OpenCL, CUDA and HIP.

CMake build

```
-D GPU_API=value           # value = opencl (default) or cuda or hip
-D GPU_PREC=value         # precision setting
                           # value = double or mixed (default) or single
-D GPU_ARCH=value         # primary GPU hardware choice for all GPU_API back ends
                           # value = sm_XX for cuda and hip/nvcc (see below),
                           # gfx<XXX> for hip/amd, or spirv for hip/spirv
                           # defaults: sm_75 (cuda, hip/nvcc), gfx906 (hip/amd),
                           # spirv (hip/spirv)
-D GPU_DEBUG=value        # enable debug code in the GPU package library,
                           # mostly useful for developers
                           # value = yes or no (default)
-D HIP_PATH=value         # value = path to HIP installation. Must be set if
                           # GPU_API=HIP
-D HIP_ARCH=value         # deprecated, use GPU_ARCH instead (still accepted,
                           # but prints a deprecation warning)
-D HIP_USE_DEVICE_SORT=value # enables GPU sorting
                           # value = yes (default) or no
-D CUDPP_OPT=value        # use GPU binning with CUDA (should be off for modern GPUs)
                           # enables CUDA Performance Primitives, must be "no" for
                           # CUDA_MPS_SUPPORT=yes
                           # value = yes or no (default)
-D CUDA_MPS_SUPPORT=value # enables some tweaks required to run with active
                           # nvidia-cuda-mps daemon
                           # value = yes or no (default)
-D CUDA_BUILD_MULTIARCH=value # enables building CUDA kernels for all supported GPU
                           # architectures
                           # value = yes (default) or no
-D USE_STATIC_OPENCL_LOADER=value # downloads/includes OpenCL ICD loader library,
                                   # no local OpenCL headers/libs needed
                                   # value = yes (default) or no
```

The GPU package supports 3 precision modes: single, double, and mixed, with the latter being the default. In the double precision mode, atom positions, forces and energies are stored, computed and accumulated in double precision. In the mixed precision mode, forces and energies are accumulated in double precision while atom coordinates are stored and arithmetic operations are performed in single precision. In the single precision mode, all are stored, executed and accumulated in single precision.

To specify the precision mode (output to the screen before LAMMPS runs for verification), set GPU_PREC to one of single, double, or mixed.

Some accelerators or OpenCL implementations only support single precision. This mode should be used with care and appropriate validation as the errors can scale with system size in this implementation. This can be useful for accelerating test runs when setting up a simulation for production runs on another machine. In the case where only single precision is supported, either LAMMPS must be compiled with -DFFT_SINGLE to use PPPM with GPU acceleration or GPU acceleration should be disabled for PPPM (e.g. suffix off or pair/only as described in the LAMMPS documentation).

Changed in version 4Jul2026.

GPU_ARCH is the canonical architecture setting for all GPU_API back ends. The back end specific HIP_ARCH (for

GPU_API=hip) variable is still accepted for backward compatibility, but its use is deprecated and prints a warning.

For GPU_API=cuda and GPU_API=hip with HIP_PLATFORM=nvcc, the GPU_ARCH settings for different GPU hardware are as follows:

- sm_30 for Kepler (supported since CUDA 5 and until CUDA 10.x)
- sm_35 or sm_37 for Kepler (supported since CUDA 5 and until CUDA 11.x)
- sm_50 or sm_52 for Maxwell (supported since CUDA 6)
- sm_60 or sm_61 for Pascal (supported since CUDA 8)
- sm_70 for Volta (supported since CUDA 9)
- sm_75 for Turing (supported since CUDA 10)
- sm_80 or sm_86 for Ampere (supported since CUDA 11, sm_86 since CUDA 11.1)
- sm_89 for Lovelace (supported since CUDA 11.8)
- sm_90 or sm_90a for Hopper (supported since CUDA 12.0)
- sm_100 or sm_103 for Blackwell B100/B200/B300 (supported since CUDA 12.8)
- sm_120 for Blackwell B20x/B40 (supported since CUDA 12.8)
- sm_121 for Blackwell (supported since CUDA 12.9)

A more detailed list can be found, for example, at [Wikipedia's CUDA article](#)

CMake can detect which version of the CUDA toolkit is used and thus will try to include support for **all** major GPU architectures supported by this toolkit. Thus the GPU_ARCH setting is merely an optimization, to have code for the preferred GPU architecture directly included rather than having to wait for the JIT compiler of the CUDA driver to translate it. This behavior can be turned off (e.g. to speed up compilation) by setting CUDA_ENABLE_MULTIARCH to no.

When compiling for CUDA or HIP with CUDA, version 8.0 or later of the CUDA toolkit is required and a GPU architecture of Kepler or later, which must *also* be supported by the CUDA toolkit in use **and** the CUDA driver in use. When compiling for OpenCL, OpenCL version 1.2 or later is required and the GPU must be supported by the GPU driver and OpenCL runtime bundled with the driver.

Please note that the GPU library accesses the CUDA driver library directly, so it needs to be linked with the CUDA driver library (libcudart.so) that ships with the Nvidia driver. If you are compiling LAMMPS on the head node of a GPU cluster, this library may not be installed, so you may need to copy it over from one of the compute nodes (best into this directory). Recent versions of the CUDA toolkit starting from CUDA 9 provide a dummy libcudart.so library (typically under \$(CUDA_HOME)/lib64/stubs), that can be used for linking. If you are compiling LAMMPS with the -D BUILD_SHARED_LIBS=ON setting, you may get to see ld: warning: libcudart.so.1, needed by liblammps.so.0, not found. This may be worked around by also setting: -DCMAKE_EXE_LINKER_FLAGS=-Wl, --unresolved-symbols=ignore-in-shared-libs.

To support the CUDA multi-process server (MPS) you can set the define -DCUDA_MPS_SUPPORT. Please note that in this case you must **not** use the CUDA performance primitives and thus set the variable CUDPP_OPT to empty.

If you are compiling for OpenCL, the default setting is to download, build, and link with a static OpenCL ICD loader library and standard OpenCL headers. This way no local OpenCL development headers or library needs to be present and only OpenCL compatible drivers need to be installed to use OpenCL. If this is not desired, you can set USE_STATIC_OPENCL_LOADER to no.

If GERYON_NUMA_FISSION is defined at build time (-DGPU_DEBUG=no), LAMMPS will consider separate NUMA nodes on GPUs or accelerators as separate devices. For example, a 2-socket CPU would appear as two separate devices for OpenCL (and LAMMPS would require two MPI processes to use both sockets with the GPU library - each with its own device ID as output by ocl_get_devices). OpenCL version 1.2 or later is required.

If you are compiling with HIP, note that before running CMake you will have to set appropriate environment variables. Some variables such as `HCC_AMDGPU_TARGET` (for ROCm <= 4.0) or `CUDA_PATH` are necessary for `hipcc` and the linker to work correctly.

When compiling for HIP ROCm, GPU sorting with `-D HIP_USE_DEVICE_SORT=on` requires installing the `hipcub` library (<https://github.com/ROCmSoftwarePlatform/hipCUB>). Setting `-DDOWNLOAD_CUB=yes` will download and compile CUB.

The GPU library has some multi-thread support using OpenMP. If LAMMPS is built with `-D BUILD_OMP=on` this will also be enabled.

Note

Some Clang-based tool chains - in particular `hipcc` from ROCm - do not ship the `omp.h` header in the compiler's own resource directory. When building with `-D BUILD_OMP=on` and such a compiler, host code that includes `<omp.h>` would fail to compile even though the `-fopenmp` flag is accepted. CMake detects this case and adds the `omp.h` from a matching version of the system Clang installation as a fallback include path (using `-idirafter` so it does not shadow other headers). If no matching `omp.h` can be found automatically, you may need to add the directory containing it yourself, for example with `-D CMAKE_CXX_FLAGS=-idirafter/usr/lib/clang/<version>/include`.

For a debug build, set `GPU_DEBUG` to be yes.

Added in version 3Aug2022.

Using the CHIP-SPV implementation of HIP is supported. It allows one to run HIP code on Intel GPUs via the OpenCL or Level Zero back ends. To use CHIP-SPV, you must set `-DHIP_USE_DEVICE_SORT=OFF` in your CMake command-line as CHIP-SPV does not yet support `hipCUB`. As of Summer 2022, the use of HIP for Intel GPUs is experimental. You should only use this option in preparations to run on Aurora system at Argonne.

```
# AMDGPU target (ROCm <= 4.0)
export HIP_PLATFORM=hcc
export HIP_PATH=/path/to/HIP/install
export HCC_AMDGPU_TARGET=gfx906
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_COMPILER=hipcc ..
make -j 4
```

```
# AMDGPU target (ROCm >= 4.1)
export HIP_PLATFORM=amd
export HIP_PATH=/path/to/HIP/install
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_COMPILER=hipcc ..
make -j 4
```

```
# CUDA target (not recommended, use GPU_API=cuda)
# !!! DO NOT set CMAKE_CXX_COMPILER !!!
export HIP_PLATFORM=nvcc
export HIP_PATH=/path/to/HIP/install
export CUDA_PATH=/usr/local/cuda
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=sm_70 ..
make -j 4
```

```
# SPIR-V target (Intel GPUs)
export HIP_PLATFORM=spirv
export HIP_PATH=/path/to/HIP/install
```

(continues on next page)

(continued from previous page)

```
export CMAKE_CXX_COMPILER=<hipcc/clang++>
cmake -D PKG_GPU=on -D GPU_API=HIP ..
make -j 4
```

3.8.4 KIM package

To build with this package, the KIM API v2.0+ must be downloaded and built on your system. See [Obtaining KIM Models](#) to learn how to install the KIM API, as well as how to install any models you wish to use afterward. See the list of all KIM models here: <https://openkim.org/browse/models>

If you would like to use the *kim query* command, you also need to have libcurl installed with the matching development headers and the curl-config tool.

If you would like to use the *kim property* command, you need to build LAMMPS with the PYTHON package installed and linked to Python 3.6 or later. See the *PYTHON package build info* for more details on this. After successfully building LAMMPS with Python, you also need to install the *kim-property* Python package, which can be easily done using *pip* as `pip install kim-property`, or from the *conda-forge* channel as `conda install kim-property` if LAMMPS is built in Conda. More detailed information is available at: [kim-property installation](#).

CMake build

```
-D DOWNLOAD_KIM=value           # download OpenKIM API v2 for build
                                # value = no (default) or yes
-D LMP_DEBUG_CURL=value         # set libcurl verbose mode on/off
                                # value = off (default) or on
-D LMP_NO_SSL_CHECK=value       # tell libcurl to not verify the peer
                                # value = no (default) or yes
-D KIM_EXTRA_UNITTESTS=value    # enables extra unit tests
                                # value = no (default) or yes
```

If `DOWNLOAD_KIM` is set to `yes` (or `on`), the KIM API library will be downloaded and built inside the CMake build directory. Note that in most cases it is recommended that you do not use this option, and instead provide a KIM API installation yourself before building LAMMPS. If the KIM library is already installed on your system (in a location where CMake cannot find it), you may need to set the `PKG_CONFIG_PATH` environment variable so that `libkim-api` can be found, or run the command `source kim-api-activate`. If CMake cannot find the KIM API when configuring for the first time (or after clearing the CMake cache), the default value of the `DOWNLOAD_KIM` option will be `yes`.

Extra unit tests can only be available if they are explicitly requested (`KIM_EXTRA_UNITTESTS` is set to `yes` (or `on`)) and the prerequisites are met. See *KIM Extra unit tests* for more details on this.

i Traditional make

Changed in version 10Sep2025.

The KIM package no longer supports the traditional make build. You need to build LAMMPS with CMake.

Debugging OpenKIM web queries in LAMMPS

If `LMP_DEBUG_CURL` is set, the libcurl verbose mode will be turned on, and any libcurl calls within the KIM web query display a lot of information about libcurl operations. You hardly ever want this set in production use, you will almost always want this when you debug or report problems.

The libcurl library performs peer SSL certificate verification by default. This verification is done using a CA certificate store that the SSL library can use to make sure the peer's server certificate is valid. If SSL reports an error ("certificate verify failed") during the handshake and thus refuses further communicate with that server, you can set `LMP_NO_SSL_CHECK` to override that behavior. When LAMMPS is compiled with `LMP_NO_SSL_CHECK` set, libcurl does not verify the peer and connection attempts will succeed regardless of the names in the certificate. This option is insecure. As an alternative, you can specify your own CA cert path by setting the environment variable `CURL_CA_BUNDLE` to the path of your choice. A call to the KIM web query would get this value from the environment variable.

KIM Extra unit tests (CMake only)

During development, testing, or debugging, if *unit testing* is enabled in LAMMPS, one can also enable extra tests on *KIM commands* by setting the `KIM_EXTRA_UNITTESTS` to yes (or on).

Enabling the extra unit tests have some requirements,

- It requires to have internet access.
- It requires to have libcurl installed with the matching development headers and the curl-config tool.
- It requires to build LAMMPS with the PYTHON package installed and linked to Python 3.6 or later. See the *PYTHON package build info* for more details on this.
- It requires to have kim-property Python package installed, which can be easily done using *pip* as `pip install kim-property`, or from the *conda-forge* channel as `conda install kim-property` if LAMMPS is built in Conda. More detailed information is available at: [kim-property installation](#).
- It is also necessary to install the following KIM models:
 - `EAM_Dynamo_MendeleevAckland_2007v3_Zr__MO_004835508849_001`
 - `EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_006`
 - `LennardJones612_UniversalShifted__MO_959249795837_003` (this model is an example model automatically built with the API unless explicitly disabled)

See [Obtaining KIM Models](#) to learn how to install a pre-built binary of the OpenKIM Repository of Models or see [Installing KIM Models](#) to learn how to install the specific KIM models.

3.8.5 KOKKOS package

Using the KOKKOS package requires choosing several settings. You have to select whether you want to compile with parallelization on the host and whether you want to include offloading of calculations to a device (e.g. a GPU). The default setting is to have no host parallelization and no device offloading. In addition, you can select the hardware architecture to select the instruction set. Since most hardware is backward compatible, you may choose settings for an older architecture to have an executable that will run on this and newer architectures.

Note

If you run Kokkos on a different GPU architecture than what LAMMPS was compiled with, there will be a delay during device initialization while the just-in-time compiler is recompiling all GPU kernels for the new hardware. This is, however, only supported for GPUs of the **same** major hardware version and different minor hardware versions, e.g. 5.0 and 5.2 but not 5.2 and 6.0. LAMMPS will abort with an error message indicating a mismatch, if the major version differs.

The settings discussed below have been tested with LAMMPS and are confirmed to work. Kokkos is an active project with ongoing improvements and projects working on including support for additional architectures. More information on Kokkos can be found on the [Kokkos GitHub project](#).

Available Architecture settings

These are the possible choices for the Kokkos architecture ID. They must be specified in uppercase.

Arch-ID	HOST or GPU	Description
NATIVE	HOST	Local machine
AMDAVX	HOST	AMD chip
ARMV80	HOST	ARMv8.0 Compatible CPU
ARMV81	HOST	ARMv8.1 Compatible CPU
ARMV84	HOST	ARMv8.4 Compatible CPU
ARMV84_SVE	HOST	Generic ARMv8.4 with SVE support (-march=armv8.4-a+sve)
ARMV8_THUNDERX	HOST	ARMv8 Cavium ThunderX CPU
ARMV8_THUNDERX2	HOST	ARMv8 Cavium ThunderX2 CPU
A64FX	HOST	ARMv8.2 with SVE Support
ARMV9_GRACE	HOST	ARMv9 NVIDIA Grace CPU
SNB	HOST	Intel Sandy/Ivy Bridge CPUs
HSW	HOST	Intel Haswell CPUs
BDW	HOST	Intel Broadwell Xeon E-class CPUs
ICL	HOST	Intel Ice Lake Client CPUs (AVX512)
ICX	HOST	Intel Ice Lake Xeon Server CPUs (AVX512)
SKL	HOST	Intel Skylake Client CPUs
SKX	HOST	Intel Skylake Xeon Server CPUs (AVX512)
KNC	HOST	Intel Knights Corner Xeon Phi
KNL	HOST	Intel Knights Landing Xeon Phi
SPR	HOST	Intel Sapphire Rapids Xeon Server CPUs (AVX512)
POWER8	HOST	IBM POWER8 CPUs
POWER9	HOST	IBM POWER9 CPUs
ZEN	HOST	AMD Zen architecture
ZEN2	HOST	AMD Zen2 architecture
ZEN3	HOST	AMD Zen3 architecture
ZEN4	HOST	AMD Zen4 architecture
ZEN5	HOST	AMD Zen5 architecture
RISCV_SG2042	HOST	SG2042 (RISC-V) CPUs
RISCV_RVA22V	HOST	RVA22V (RISC-V) CPUs
RISCV_U74MC	HOST	U74MC (RISC-V) CPUs

INTEL_XEHP	GPU	Intel GPU Xe-HP
INTEL_PVC	GPU	Intel GPU Ponte Vecchio
INTEL_DG2	GPU	Intel GPU DG2

This list was last updated for version 5.1.0 of the Kokkos library.

Basic CMake build settings

For multicore CPUs using OpenMP, set these 2 variables.

```
-D Kokkos_ARCH_HOSTARCH=yes # HOSTARCH = HOST from list above
-D Kokkos_ENABLE_OPENMP=yes
-D BUILD_OMP=yes
```

Please note that enabling OpenMP for KOKKOS requires that OpenMP is also *enabled for the rest of LAMMPS*.

For Intel KNLs using OpenMP, set these variables:

```
-D Kokkos_ARCH_KNL=yes
-D Kokkos_ENABLE_OPENMP=yes
```

For NVIDIA GPUs using CUDA, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes # GPUARCH = GPU from list above
-D Kokkos_ENABLE_CUDA=yes
-D Kokkos_ENABLE_OPENMP=yes
```

This will also enable executing FFTs on the GPU, either via the internal KISSFFT library, or - by preference - with the cuFFT library bundled with the CUDA toolkit, depending on whether CMake can identify its location.

For AMD or NVIDIA GPUs using HIP, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes # GPUARCH = GPU from list above
-D Kokkos_ENABLE_HIP=yes
-D Kokkos_ENABLE_OPENMP=yes
```

This will enable FFTs on the GPU, either by the internal KISSFFT library or with the hipFFT wrapper library, which will call out to the platform-appropriate vendor library: rocFFT on AMD GPUs or cuFFT on NVIDIA GPUs.

For Intel GPUs using SYCL, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes # GPUARCH = GPU from list above
-D Kokkos_ENABLE_SYCL=yes
-D Kokkos_ENABLE_OPENMP=yes
-D FFT_KOKKOS=MKL_GPU
```

This will enable FFTs on the GPU using the oneMKL library.

To simplify compilation, seven preset files are included in the `cmake/presets` folder, `kokkos-serial.cmake`, `kokkos-openmp.cmake`, `kokkos-cuda.cmake`, `kokkos-cuda-nowrapper.cmake`, `kokkos-hip.cmake`, `kokkos-sycl-nvidia.cmake`, and `kokkos-sycl-intel.cmake`. They will enable the KOKKOS package and enable some hardware choices. For GPU support those preset files may need to be customized to match the hardware used. For some platforms, e.g. CUDA, the Kokkos library will try to auto-detect a suitable configuration. So to compile with CUDA device parallelization with some common packages enabled, you can do the following:

```
mkdir build-kokkos-cuda
cd build-kokkos-cuda
cmake -C ../cmake/presets/basic.cmake \
      -C ../cmake/presets/kokkos-cuda-nowrapper.cmake ../cmake
cmake --build .
```

The `kokkos-openmp.cmake` preset can be combined with any of the others, but it is not possible to combine multiple GPU acceleration settings (CUDA, HIP, SYCL) into a single executable.

Basic traditional make settings

Changed in version 11Feb2026.

The KOKKOS package no longer supports the traditional make build. You need to build LAMMPS with CMake.

Advanced KOKKOS compilation settings

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. Below are some examples that may be useful in combination with LAMMPS. For the full list (which keeps changing as the Kokkos package itself evolves), please consult the Kokkos library documentation.

As alternative to using multi-threading via OpenMP (`-DKokkos_ENABLE_OPENMP=on`) it is also possible to use Posix threads directly (`-DKokkos_ENABLE_PTHREAD=on`). While binding of threads to individual or groups of CPU cores is managed in OpenMP with environment variables, you need assistance from either the “hwloc” or “libnuma” library for the Pthread thread parallelization option. To enable use with CMake: `-DKokkos_ENABLE_HWLOC=on` or `-DKokkos_ENABLE_LIBNUMA=on`.

The CMake option `-DKokkos_ENABLE_LIBRT=on` enables the use of a more accurate timer mechanism on many Unix-like platforms for internal profiling.

The CMake option `-DKokkos_ENABLE_DEBUG=on` enables printing of run-time debugging information that can be useful. It also enables runtime bounds checking on Kokkos data structures. As to be expected, enabling this option will negatively impact the performance and thus is only recommended when developing a Kokkos-enabled style in LAMMPS.

The CMake option `-DKokkos_ENABLE_CUDA_UVM=on` enables the use of CUDA “Unified Virtual Memory” (UVM) in Kokkos. UVM allows to transparently use RAM on the host to supplement the memory used on the GPU (with some performance penalty) and thus enables running larger problems that would otherwise not fit into the RAM on the GPU.

Added in version 10Sep2025.

The CMake option `-D KOKKOS_PREC=value` sets the floating point precision of the calculations, where `value` can be one of: `double` (FP64, default) or `mixed` (FP64 for accumulation of forces, energy, and virial, FP32 otherwise) or `single` (FP32). When using reduced precision (single or mixed), the simulation and its results should be carefully checked to ensure it is stable and that, for example, energy is sufficiently well conserved. Using a lower floating point precision works best when simulating homogeneous bulk systems because those have the best error cancellation. Using `mixed` precision provides most of the performance advantages of using single precision while performing the steps most relevant for accuracy in double precision.

Added in version 10Sep2025.

The CMake option `-D KOKKOS_LAYOUT=value` sets the array layout of Kokkos views (e.g. forces, velocities, etc.) on GPUs, where `value` can be one of: `legacy` (mostly `LayoutRight`, default) or `default` (mostly `LayoutLeft`). Using the default layout (`LayoutLeft`) can give speedup on GPUs for some models, but a slowdown for others. `LayoutRight` is always used for positions on GPUs since it has been found to be faster, and when compiling exclusively for CPUs.

3.8.6 LEPTON package

To build with this package, you must build the Lepton library which is included in the LAMMPS source distribution in the `lib/lepton` folder.

i CMake build

This is the recommended build procedure for using Lepton in LAMMPS. No additional settings are normally needed besides `-D PKG_LEPTON=yes`.

On x86 hardware the Lepton library will also include a just-in-time compiler for faster execution. This is auto detected but can be explicitly disabled by setting `-D LEPTON_ENABLE_JIT=no` (or enabled by setting it to yes).

i Traditional make

Changed in version 10Sep2025.

The LEPTON package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.7 MACHDYN package

To build with this package, you must download the Eigen3 library. Eigen3 is a template library, so you do not need to build it.

i CMake build

```
-D DOWNLOAD_EIGEN3           # download Eigen3, value = no (default) or yes
-D EIGEN3_INCLUDE_DIR=path   # path to Eigen library (only needed if a
                              # custom location)
```

If `DOWNLOAD_EIGEN3` is set, the Eigen3 library will be downloaded and inside the CMake build directory. If the Eigen3 library is already on your system (in a location where CMake cannot find it), set `EIGEN3_INCLUDE_DIR` to the directory the Eigen3 include file is in.

i Traditional make

Changed in version 10Sep2025.

The MACHDYN package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.8 ML-IAP package

Building the ML-IAP package requires including the *ML-SNAP* package. There will be an error message if this requirement is not satisfied. Using the *mliappy* model also requires enabling Python support, which in turn requires to include the *PYTHON* package **and** requires to have the *cython* software installed and with it a working *cythonize* command. This feature requires compiling LAMMPS with Python version 3.6 or later.

i CMake build

```
-D MLIAP_ENABLE_PYTHON=value    # enable mliappy model (default is autodetect)
```

Without this setting, CMake will check whether it can find a suitable Python version and the `cythonize` command and choose the default accordingly. During the build procedure the provided .pyx file(s) will be automatically translated to C++ code and compiled. Please do **not** run `cythonize` manually in the `src/ML-IAP` folder, as that can lead to compilation errors if Python support is not enabled. If you did it by accident, please remove the generated .cpp and .h files.

i Traditional make

The build uses the `lib/python/Makefile.mliap_python` file in the compile/link process to add a rule to update the files generated by the `cythonize` command in case the corresponding .pyx file(s) were modified. You may need to modify `lib/python/Makefile.lammps` if the LAMMPS build fails.

To enable building the ML-IAP package with Python support enabled, you need to add `-DMLIAP_PYTHON` to the `LMP_INC` variable in your machine makefile. You may have to manually run the `cythonize` command on .pyx file(s) in the `src` folder, if this is not automatically done during installing the ML-IAP package. Please do **not** run `cythonize` in the `src/ML-IAP` folder, as that can lead to compilation errors if Python support is not enabled. If you did this by accident, please remove the generated .cpp and .h files.

3.8.9 OPT package

i CMake build

No additional settings are needed besides `-D PKG_OPT=yes`

i Traditional make

The compiler flag `-restrict` must be used to build LAMMPS with the OPT package when using Intel compilers. It should be added to the `CCFLAGS` line of your `Makefile.machine`. See `src/MAKE/OPTIONS/Makefile.opt` for an example.

3.8.10 PYTHON package

Building with the PYTHON package requires you have a the Python development headers and library available on your system, which needs to be Python version 3.6 or later. See `lib/python/README` for additional details.

i CMake build

```
-D Python_EXECUTABLE=path    # path to Python executable to use
```

Without this setting, CMake will guess the default Python version on your system. To use a different Python version, you can either create a virtualenv, activate it and then run `cmake`. Or you can set the `PYTHON_EXECUTABLE` variable to specify which Python interpreter should be used. Note note that you will also need to have the development headers installed for this version, e.g. `python3-devel`.

Traditional make

Changed in version 10Sep2025.

The PYTHON package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.11 VORONOI package

To build with this package, you must download and build the [Voro++ library](#) or install a binary package provided by your operating system.

CMake build

```
-D DOWNLOAD_VORO=value      # download Voro++ for build
                             # value = no (default) or yes
-D VORO_LIBRARY=path        # Voro++ library file
                             # (only needed if at custom location)
-D VORO_INCLUDE_DIR=path    # Voro++ include directory
                             # (only needed if at custom location)
```

If `DOWNLOAD_VORO` is set, the Voro++ library will be downloaded and built inside the CMake build directory. If the Voro++ library is already on your system (in a location CMake cannot find it), `VORO_LIBRARY` is the filename (plus path) of the Voro++ library file, not the directory the library file is in. `VORO_INCLUDE_DIR` is the directory the Voro++ include file is in.

Traditional make

Changed in version 10Sep2025.

The VORONOI package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.12 ADIOS package

The ADIOS package requires the [ADIOS I/O library](#), version 2.3.1 or newer. Make sure that you have ADIOS built either with or without MPI to match if you build LAMMPS with or without MPI. ADIOS compilation settings for LAMMPS are automatically detected, if the `PATH` and `LD_LIBRARY_PATH` environment variables have been updated for the local ADIOS installation and the instructions below are followed for the respective build systems.

i CMake build

```
-D ADIOS2_DIR=path          # path is where ADIOS 2.x is installed
-D PKG_ADIOS=yes
```

i Traditional make

Turn on the ADIOS package before building LAMMPS. If the ADIOS 2.x software is installed in PATH, there is nothing else to do:

```
make yes-adios
```

otherwise, set ADIOS2_DIR environment variable when turning on the package:

```
ADIOS2_DIR=path make yes-adios    # path is where ADIOS 2.x is installed
```

3.8.13 APIP package

The APIP package depends on the library of the *ML-PACE* package. The code for the library can be found at: <https://github.com/ICAMS/lammps-user-pace/>

i CMake build

No additional settings are needed besides `-D PKG_APIP=yes` and `-D PKG_ML-PACE=yes`. One can use a local version of the ML-PACE library instead of automatically downloading the library as described [here](#).

i Traditional make

Changed in version 10Sep2025.

The APIP package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.14 COLVARS package

This package enables the use of the *Colvars* module included in the LAMMPS source distribution.

i CMake build

This is the recommended build procedure for using Colvars in LAMMPS. No additional settings are normally needed besides `-D PKG_COLVARS=yes`. The following CMake variables are available.

```
-D PKG_COLVARS=yes          # enable the package itself
-D COLVARS_LEPTON=yes       # use the Lepton library for custom expression
→ (on by default)
```

```
-D COLVARS_DEBUG=no           # enable debugging message (verbose, off by default)
```

i Traditional make

Changed in version 10Sep2025.

The COLVARS package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.15 ELECTRODE package

This package depends on the KSPACE package.

i CMake build

```
-D PKG_ELECTRODE=yes          # enable the package itself
-D PKG_KSPACE=yes             # the ELECTRODE package requires KSPACE
-D USE_INTERNAL_LINALG=value  #
```

Features in the ELECTRODE package are dependent on code in the KSPACE package so the latter one *must* be enabled.

The ELECTRODE package also requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the ELECTRODE build script. But on some systems this may cause problems when linking or the dependency is not desired. Try enabling USE_INTERNAL_LINALG in those cases to use the bundled linear algebra library and work around the limitation.

i Traditional make

The ELECTRODE package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.16 MBX package

Added in version 11Feb2026.

This package requires the MBX library that can be downloaded and built either before LAMMPS is built or as part of the LAMMPS compilation. The code for the library can be found at: <https://github.com/paesanilab/MBX/>

Instead of including the MBX package directly into LAMMPS, it is also possible to skip this step and build the MBX package as a plugin using the CMake script files in the `examples/PACKAGE/mbx/plugin` folder and then load this plugin at runtime with the *plugin command*.

i CMake build

Changed in version 30Mar2026: Replaced MD5 checksums with SHA-256

By default the MBX library will be downloaded from the git repository and built automatically when the MBX package is enabled with `-D PKG_MBX=yes`. The location for the sources may be customized by setting the variable `MBXLIB_URL` when configuring with CMake (e.g. to use a local archive on machines without internet access). Since CMake checks the validity of the archive using a SHA-256 checksum you may also need to set the `MBXLIB_SHA256` variable to the corresponding checksum (e.g. computed with `sha256sum`) if you provide a different library version than what is downloaded automatically.

i Traditional make

The MBX package does not support the traditional make build. You need to build LAMMPS with CMake to use it.

3.8.17 ML-PACE package

This package requires a library that can be downloaded and built in `lib/pace` or somewhere else, which must be done before building LAMMPS with this package. The code for the library can be found at: <https://github.com/ICAMS/lammps-user-pace/>

Instead of including the ML-PACE package directly into LAMMPS, it is also possible to skip this step and build the ML-PACE package as a plugin using the CMake script files in the `examples/PACKAGE/pace/plugin` folder and then load this plugin at runtime with the *plugin command*.

i CMake build

Changed in version 30Mar2026: Replaced MD5 checksums with SHA-256

By default the library will be downloaded from the git repository and built automatically when the ML-PACE package is enabled with `-D PKG_ML-PACE=yes`. The location for the sources may be customized by setting the variable `PACELIB_URL` when configuring with CMake (e.g. to use a local archive on machines without internet access). Since CMake checks the validity of the archive using a SHA-256 checksum you may also need to set the `PACELIB_SHA256` variable to the corresponding checksum (e.g. computed with `sha256sum`) if you provide a different library version than what is downloaded automatically.

i Traditional make

Changed in version 10Sep2025.

The ML-PACE package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.18 ML-POD package

i CMake build

No additional settings are needed besides `-D PKG_ML-POD=yes`.

i Traditional make

Changed in version 10Sep2025.

The ML-POD package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.19 ML-QUIP package

To build with this package, you must download and build the QUIP library. It can be obtained from GitHub. For support of GAP potentials, additional files with specific licensing conditions need to be downloaded and configured. The automatic download will from within CMake will download the non-commercial use version.

i CMake build

```
-D DOWNLOAD_QUIP=value      # download QUIP library for build
                             # value = no (default) or yes
-D QUIP_LIBRARY=path        # path to libquip.a
                             # (only needed if a custom location)
-D USE_INTERNAL_LINALG=value # Use the internal linear algebra library
                             # instead of LAPACK
                             # value = no (default) or yes
```

CMake will try to download and build the QUIP library from GitHub, if it is not found on the local machine. This requires to have git installed. It will use the same compilers and flags as used for compiling LAMMPS. Currently this is only supported for the GNU and the Intel compilers. Set the QUIP_LIBRARY variable if you want to use a previously compiled and installed QUIP library and CMake cannot find it.

The QUIP library requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the QUIP build script. But on some systems this triggers a (current) limitation of CMake and the configuration will fail. Try enabling USE_INTERNAL_LINALG in those cases to use the bundled linear algebra library and work around the limitation.

i Traditional make

Changed in version 10Sep2025.

The ML-QUIP package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.20 PLUMED package

Before building LAMMPS with this package, you must first build PLUMED. PLUMED can be built as part of the LAMMPS build or installed separately from LAMMPS using the generic [PLUMED installation instructions](#). The PLUMED package has been tested to work with Plumed versions 2.4.x, to 2.9.x and will error out, when trying to run calculations with a different version of the Plumed kernel.

PLUMED can be linked into MD codes in three different modes: static, shared, and runtime. With the “static” mode, all the code that PLUMED requires is linked statically into LAMMPS. LAMMPS is then fully independent from the PLUMED installation, but you have to rebuild/relink it in order to update the PLUMED code inside it. With the “shared” linkage mode, LAMMPS is linked to a shared library that contains the PLUMED code. This library should preferably be installed in a globally accessible location. When PLUMED is linked in this way the same library can be used by multiple MD packages. Furthermore, the PLUMED library LAMMPS uses can be updated without the need for a recompile of LAMMPS for as long as the shared PLUMED library is ABI-compatible.

The third linkage mode is “runtime” which allows the user to specify which PLUMED kernel should be used at runtime by using the PLUMED_KERNEL environment variable. This variable should point to the location of the libplumed-Kernel.so dynamical shared object, which is then loaded at runtime. This mode of linking is particularly convenient for doing PLUMED development and comparing multiple PLUMED versions as these sorts of comparisons can be done without recompiling the hosting MD code. All three linkage modes are supported by LAMMPS on selected operating systems (e.g. Linux) and using either CMake or traditional make build. The “static” mode should be the most portable, while the “runtime” mode support in LAMMPS makes the most assumptions about operating system and compiler environment. If one mode does not work, try a different one, switch to a different build system, consider a global PLUMED installation or consider downloading PLUMED during the LAMMPS build.

Instead of including the PLUMED package directly into LAMMPS, it is also possible to skip this step and build the PLUMED package as a plugin using the CMake script files in the `examples/PACKAGE/plumed/plugin` folder and then load this plugin at runtime with the [plugin command](#).

CMake build

When the `-D PKG_PLUMED=yes` flag is included in the cmake command you must ensure that *the GNU Scientific Library (GSL)* <<https://www.gnu.org/software/gsl/>> is installed in locations that are accessible in your environment. There are then two additional variables that control the manner in which PLUMED is obtained and linked into LAMMPS.

```
-D DOWNLOAD_PLUMED=value    # download PLUMED for build
                             # value = no (default) or yes
-D PLUMED_MODE=value        # Linkage mode for PLUMED
                             # value = static (default), shared,
                             #           or runtime
```

If `DOWNLOAD_PLUMED` is set to yes, the PLUMED library will be downloaded (the version of PLUMED that will be downloaded is hard-coded to a vetted version of PLUMED, usually a recent stable release version) and built inside the CMake build directory. If `DOWNLOAD_PLUMED` is set to “no” (the default), CMake will try to detect and link to an installed version of PLUMED. For this to work, the PLUMED library has to be installed into a location where the `pkg-config` tool can find it or the `PKG_CONFIG_PATH` environment variable has to be set up accordingly. PLUMED should be installed in such a location if you compile it using the default make; make install commands.

The `PLUMED_MODE` setting determines the linkage mode for the PLUMED library. The allowed values for this flag are “static” (default), “shared”, or “runtime”. If you want to switch the linkage mode, just re-run CMake with a different setting. For a discussion of PLUMED linkage modes, please see above. When `DOWNLOAD_PLUMED` is enabled the static linkage mode is recommended.

i Traditional make

Changed in version 10Sep2025.

The PLUMED package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.21 H5MD package

To build with this package you must have the HDF5 software package installed on your system, which should include the h5cc compiler and the HDF5 library.

i CMake build

No additional settings are needed besides `-D PKG_H5MD=yes`.

This should auto-detect the H5MD library on your system. Several advanced CMake H5MD options exist if you need to specify where it is installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

i Traditional make

Changed in version 10Sep2025.

The H5MD package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.22 ML-HDNNP package

To build with the ML-HDNNP package it is required to download and build the external `n2p2` library v2.1.4 (or higher). The LAMMPS build process offers an automatic download and compilation of `n2p2` or allows you to choose the installation directory of `n2p2` manually. Please see the boxes below for the CMake and traditional build system for detailed information.

In case of a manual installation of `n2p2` you only need to build the `n2p2` core library `libnnp` and interface library `libnnpif`. When using GCC it should suffice to execute `make libnnpif` in the `n2p2` src directory. For more details please see `lib/hdnnp/README` and the [n2p2 build documentation](#).

i CMake build

```
-D DOWNLOAD_N2P2=value      # download n2p2 for build
                             # value = no (default) or yes
-D N2P2_DIR=path            # n2p2 base directory
                             # (only needed if a custom location)
```

If `DOWNLOAD_N2P2` is set, the `n2p2` library will be downloaded and built inside the CMake build directory. If the `n2p2` library is already on your system (in a location CMake cannot find it), set the `N2P2_DIR` to path where `n2p2` is located. If `n2p2` is located directly in `lib/hdnnp/n2p2` it will be automatically found by CMake.

i Failure to build n2p2 due to git branch names

Some script code inside the *n2p2* library build processes the current branch name used by git and that will fail for LAMMPS repository branch names containing the forward slash '/' character, for example: `user/update-n2p2`. The workaround is to change the (local) branch name, e.g. for the given example with: `git branch -m user/update-n2p2 user_update-n2p2`

i Traditional make

Changed in version 10Sep2025.

The ML-HDNNP package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.23 ML-RUNNER package

The ML-RUNNER package provides an interface to the [RuNNer](#) (Ruhr University Neural Network Energy Representation) library for high-dimensional neural network potentials (HDNNP).

Prerequisites

- **Fortran Compiler:** Since the RuNNer library is written in Fortran, a working Fortran compiler must be available on your system and detectable by CMake.
- **BLAS/LAPACK:** RuNNer requires BLAS and LAPACK libraries for linear algebra operations.
- **FFT Library:** RuNNer uses an FFT library for electrostatic calculations (3G/4G). It can use either MKL or FFTW3 and the choice is imported from the KSPACE package configuration. When using FFTW3 also FFTW3 threading (`-DFFT_FFTW_THREADING=ON`) needs to be enabled which is usually auto-detected. These restrictions are needed so that LAMMPS and RuNNer use the same FFT library settings and link to the same library. In both cases the Fortran 03 wrapper file `fftw3.f03` must be in the Fortran compiler include path.

Building RuNNer

By default, the LAMMPS build process automatically downloads and compiles the RuNNer library as a static library. Alternatively, you can point LAMMPS to a pre-compiled version already present on your system.

i CMake build

Basic Options:

```
-D PKG_ML-RUNNER=yes      # yes (default): Download and build RuNNer
→ automatically.
-D DOWNLOAD_RUNNER=yes    # yes (default): clone the stable version of the
→ official RuNNer repo.
                          # no: Use a pre-compiled RuNNer library.
-D RUNNER_SHARED_LIB=yes  # no: (default): Look for static library (.a).
                          # yes: Look for shared library (.so).
```

Manual Library Configuration (if `DOWNLOAD_RUNNER=no`):

```
-D RUNNER_LIB_DIR=path    # Directory containing the RuNNer library.
                          # (default: $HOME/.local/lib)
-D RUNNER_LIB_NAME=name   # Filename of the library (without extension).
                          # (default: libRuNNer_mpi)
```

FFT Library Selection:

The build system uses the FFT selection from the KSPACE package. Only MKL and FFTW3 are currently supported

```
-D FFT=value           # FFTW3 or MKL
-D FFT_MKL_THREADS=yes # required with MKL (default)
-D FFT_FFTW_THREADS=yes # required with FFTW3 (default)
```

i Traditional make

The ML-RUNNER package does not support the traditional make build system. You must build LAMMPS with CMake.

Detailed Option Table

Option	Description	Default
DOWNLOAD_RUNNER	Download and build RuNNer from source	yes
RUNNER_LIB_DIR	Path to a pre-installed RuNNer library	\$HOME/.local/lib
RUNNER_LIB_NAME	Name of the RuNNer library file without extension	libRuNNer_mpi
RUNNER_SHARED_LIB	Link against a shared RuNNer library	yes
FFT	FFT library to use (FFTW3 or MKL)	auto-detected
FFT_MKL_THREADS	Use multi-threaded MKL FFT	yes
FFT_FFTW_THREADS	Use multi-threaded FFTW	yes

3.8.24 INTEL package

This package optimizes styles for x86 CPUs. You should also typically *install the OPENMP package*, as it can be used in tandem with the INTEL package to good effect, as explained on the *INTEL package* page.

When using Intel compilers version 16.0 or later is required. You can also use the GNU or Clang compilers and they will provide performance improvements over regular styles and OPENMP styles, but less so than with the Intel compilers. Please also note, that some compilers have been found to apply memory alignment constraints incompletely or incorrectly and thus can cause segmentation faults in otherwise correct code when using features from the INTEL package.

i CMake build

```
-D INTEL_LRT_MODE=value # value = threads, none, or c++17
```

i Traditional make

Choose compiler flags in Makefile.machine via the following settings. See src/MAKE/OPTIONS/Makefile.intel_cpu* files for examples and src/INTEL/README for additional information.

```
OPTFLAGS = -xHost -O2 -fp-model fast=2 -no-prec-div -qoverride-limits -qopt-
→ zmm-usage=high
```

```
CCFLAGS = -g -qopenmp -DLAMMPS_MEMALIGN=64 -fno-alias -ansi-alias -  
→restrict $(OPTFLAGS)  
LINKFLAGS = -g -qopenmp $(OPTFLAGS)  
LIB = -ltbbmalloc
```

In Long-range thread mode (LRT) a modified verlet style is used, that operates the Kspace calculation in a separate thread concurrently to other calculations. This has to be enabled in the *package intel* command at runtime. With the setting “threads” it used the pthreads library, while “c++17” will use the built-in thread support of C++17 compilers. The option “none” skips compilation of this feature. The default is to use “threads” if pthreads is available and otherwise “none”.

Best performance is achieved with Intel hardware, Intel compilers, as well as the Intel TBB and MKL libraries. However, the code also compiles, links, and runs with other compilers / hardware and without TBB and MKL.

3.8.25 MDI package

CMake build

```
-D DOWNLOAD_MDI=value    # download MDI Library for build  
                        # value = no (default) or yes
```

Traditional make

Changed in version 10Sep2025.

The MDI package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.26 MISC package

The *fix imd* style in this package can be run either synchronously (communication with IMD clients is done in the main process) or asynchronously (the fix spawns a separate thread that can communicate with IMD clients concurrently to the LAMMPS execution).

CMake build

```
-D LAMMPS_ASYNC_IMD=value # Run IMD server asynchronously  
                        # value = no (default) or yes
```

i Traditional make

To enable asynchronous mode the `-DLAMMPS_ASYNC_IMD` define needs to be added to the `LMP_INC` variable in the `Makefile.machine` you are using. For example:

```
LMP_INC = -DLAMMPS_ASYNC_IMD -DLAMMPS_MEMALIGN=64
```

3.8.27 MOLFILE package

i CMake build

```
-D MOLFILE_INCLUDE_DIR=path  # (optional) path where VMD molfile
                             # plugin headers are installed
-D PKG_MOLFILE=yes
```

Using `-D PKG_MOLFILE=yes` enables the package, and setting `-D MOLFILE_INCLUDE_DIR` allows to provide a custom location for the molfile plugin header files. These should match the ABI of the plugin files used, and thus one typically sets them to include folder of the local VMD installation in use. LAMMPS ships with a couple of default header files that correspond to a popular VMD version, usually the latest release.

i Traditional make

Changed in version 10Sep2025.

The MOLFILE package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.28 NETCDF package

To build with this package you must have the NetCDF library installed on your system.

i CMake build

No additional settings are needed besides `-D PKG_NETCDF=yes`.

This should auto-detect the NETCDF library if it is installed on your system at standard locations. Several advanced CMake NETCDF options exist if you need to specify where it was installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

i Traditional make

Changed in version 10Sep2025.

The NETCDF package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.29 OPENMP package

i CMake build

No additional settings are required besides `-D PKG_OPENMP=yes`. If CMake detects OpenMP compiler support, the OPENMP code will be compiled with multi-threading support enabled, otherwise as optimized serial code.

i Traditional make

To enable multi-threading support in the OPENMP package (and other styles supporting OpenMP) the following compile and link flags must be added to your Makefile.machine file. See `src/MAKE/OPTIONS/Makefile.omp` for an example.

```
CCFLAGS: -fopenmp           # for GNU and Clang Compilers
CCFLAGS: -qopenmp -restrict  # for Intel compilers on Linux
LINKFLAGS: -fopenmp         # for GNU and Clang Compilers
LINKFLAGS: -qopenmp         # for Intel compilers on Linux
```

For other platforms and compilers, please consult the documentation about OpenMP support for your compiler.

i Adding OpenMP support on macOS

Apple offers the [Xcode package and IDE](#) for compiling software on macOS, so you have likely installed it to compile LAMMPS. Their compiler is based on [Clang](#), but while it is capable of processing OpenMP directives, the necessary header files and OpenMP runtime library are missing. The [R developers](#) have figured out a way to build those in a compatible fashion. One can download them from <https://mac.r-project.org/openmp/>. Simply adding those files as instructed enables the Xcode C++ compiler to compile LAMMPS with `-D BUILD_OMP=yes`.

3.8.30 QMMM package

For using LAMMPS to do QM/MM simulations via the QMMM package you need to build LAMMPS as a library. A LAMMPS executable with *fix qmmm* included can be built, but will not be able to do a QM/MM simulation on as such. You must also build a QM code - currently only Quantum ESPRESSO (QE) is supported - and create a new executable which links LAMMPS and the QM code together. Details are given in the `lib/qmmm/README` file. It is also recommended to read the instructions for [linking with LAMMPS as a library](#) for background information. This requires compatible Quantum Espresso and LAMMPS versions. The current interface and makefiles have last been verified to work in February 2020 with Quantum Espresso versions 6.3 to 6.5.

i CMake build

When using CMake, building a LAMMPS library is required and it is recommended to build a shared library, since any libraries built from the sources in the `lib` folder (including the essential `libqmmm.a`) are not included in the static LAMMPS library and are (currently) not installed, while their code is included in the shared LAMMPS library. Thus a typical command to configure building LAMMPS for QMMM would be:

```
cmake -C ../cmake/presets/basic.cmake -D PKG_QMMM=yes \
      -D BUILD_LIB=yes -DBUILD_SHARED_LIBS=yes ../cmake
```

After completing the LAMMPS build and also configuring and compiling Quantum ESPRESSO with external library support (via “make couple”), go back to the `lib/qmmm` folder and follow the instructions on the README file to build the combined LAMMPS/QE QM/MM executable (`pwqmmm.x`) in the `lib/qmmm` folder.

i Traditional make

Changed in version 10Sep2025.

The QMMM package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.31 RHEO package

This package depends on the BPM package.

i CMake build

```
-D PKG_RHEO=yes           # enable the package itself
-D PKG_BPM=yes           # the RHEO package requires BPM
-D USE_INTERNAL_LINALG=value # prefer internal LAPACK if true
```

Some features in the RHEO package are dependent on code in the BPM package so the latter one *must* be enabled as well.

The RHEO package also requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the RHEO build script. But on some systems this may cause problems when linking or the dependency is not desired. By using the setting `-D USE_INTERNAL_LINALG=yes` when running the CMake configuration, you will select compiling and linking the bundled linear algebra library and work around the limitations.

i Traditional make

Changed in version 10Sep2025.

The RHEO package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.32 SCAFACOS package

To build with this package, you must download and build the ScaFaCoS Coulomb solver library

CMake build

```
-D DOWNLOAD_SCAFACOS=value      # download ScaFaCoS for build, value = no,
→ (default) or yes
-D SCAFACOS_LIBRARY=path        # ScaFaCos library file (only needed if at,
→ custom location)
-D SCAFACOS_INCLUDE_DIR=path    # ScaFaCoS include directory (only needed if,
→ at custom location)
```

If DOWNLOAD_SCAFACOS is set, the ScaFaCoS library will be downloaded and built inside the CMake build directory. If the ScaFaCoS library is already on your system (in a location CMake cannot find it), SCAFACOS_LIBRARY is the filename (plus path) of the ScaFaCoS library file, not the directory the library file is in. SCAFACOS_INCLUDE_DIR is the directory the ScaFaCoS include file is in.

Traditional make

Changed in version 10Sep2025.

The SCAFACOS package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.8.33 VTK package

To build with this package you must have the VTK library installed on your system.

CMake build

No additional settings are needed besides `-D PKG_VTK=yes`.

This should auto-detect the VTK library if it is installed on your system at standard locations. Several advanced VTK options exist if you need to specify where it was installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

i Traditional make

Changed in version 10Sep2025.

The VTK package no longer supports the traditional make build. You need to build LAMMPS with CMake.

3.9 Build the LAMMPS documentation

Depending on how you obtained LAMMPS and whether you have built the manual yourself, this directory has a number of subdirectories and files. Here is a list with descriptions:

```

README           # brief info about the documentation
src              # content files for LAMMPS documentation
html            # HTML version of the LAMMPS manual (see html/Manual.html)
utils           # tools and settings for building the documentation
lammmps.1       # man page for the lammmps command
msi2lmp.1       # man page for the msi2lmp command
Manual.pdf      # large PDF version of entire manual
LAMMPS.epub     # Manual in ePUB e-book format
LAMMPS.mobi     # Manual in MOBI e-book format
docenv          # virtualenv folder for processing the manual sources
doctrees        # temporary data from processing the manual
doxygen         # doxygen configuration and output
.gitignore      # list of files and folders to be ignored by git
doxygen-warn.log # logfile with warnings from running doxygen
github-development-workflow.md # notes on the LAMMPS development workflow

```

If you downloaded LAMMPS as a tarball from [the LAMMPS website](https://docs.lammps.org/), the html folder and the PDF files should be included.

If you downloaded LAMMPS from the public git repository, then the HTML and PDF files are not included. You can build the HTML or PDF files yourself, by typing `make html` or `make pdf` in the doc folder. This requires various tools and files. Some of them have to be installed (see below). For the rest the build process will attempt to download and install them into a python virtual environment and local folders.

A current version of the manual (latest feature release, that is the state of the *release* branch) is available online at: <https://docs.lammps.org/>. A version of the manual corresponding to the ongoing development (that is the state of the *develop* branch) is available online at: <https://docs.lammps.org/latest/>. A version of the manual corresponding to the latest stable LAMMPS release (that is the state of the *stable* branch) is available online at: <https://docs.lammps.org/stable/>.

3.9.1 Build using GNU make

The LAMMPS manual is written in `reStructuredText` format which can be translated to different output format using the `Sphinx` document generator tool. It also incorporates programmer documentation extracted from the LAMMPS C++ sources through the `Doxygen` program. Currently the translation to HTML, PDF (via LaTeX), ePUB (for many e-book readers) and MOBI (for Amazon Kindle readers) are supported. For that to work a Python interpreter version 3.8 or later, the `doxygen` tools and internet access to download additional files and tools are required. This download is usually only required once or after the documentation folder is returned to a pristine state with `make clean-all`. You can also upgrade those packages to their latest available versions with `make upgrade`.

For the documentation build a python virtual environment is set up in the folder `doc/docenv` and various python packages are installed into that virtual environment via the `pip` tool. For rendering embedded LaTeX code also the `MathJax` JavaScript engine needs to be downloaded. If you need to pass additional options to the `pip` commands to work

(e.g. to use a web proxy or to point to additional SSL certificates) you can set them via the PIP_OPTIONS environment variable or uncomment and edit the PIP_OPTIONS setting at beginning of the makefile.

The actual translation is then done via make commands in the doc folder. The following make commands are available:

```
make html          # generate HTML in html dir using Sphinx
make pdf           # generate PDF as Manual.pdf using Sphinx and PDFLaTeX
make epub          # generate LAMMPS.epub in ePUB format using Sphinx
make mobi          # generate LAMMPS.mobi in MOBI format using ebook-convert

make fasthtml      # generate approximate HTML in fasthtml dir using pandoc

make upgrade       # upgrade sphinx, extensions, and dependencies to latest supported
→versions
make clean         # remove intermediate RST files created by HTML build
make clean-all    # remove entire build folder and any cached data
make upgrade       # upgrade the python packages in the virtual environment

make check         # run all checks listed in this block
make anchor_check  # check for duplicate anchor labels
make style_check   # check for complete and consistent style lists
make package_check # check for complete and consistent package lists
make char_check    # check for non-ASCII characters
make role_check    # check for misformatted role keywords

make link_check    # check for broken external URLs
make spelling      # spell-check the manual
```

3.9.2 Build using CMake

It is also possible to create the HTML version (and **only** the HTML version) of the manual within the *CMake build directory*. The reason for this option is to include the installation of the HTML manual pages into the “install” step when installing LAMMPS after the CMake build via `cmake --build . --target install`. The documentation build is included in the default build target, but can also be requested independently with `cmake --build . --target doc`. If you need to pass additional options to the pip commands to work (e.g. to use a web proxy or to point to additional SSL certificates) you can set them via the PIP_OPTIONS environment variable.

```
-D BUILD_DOC=value      # yes or no (default)
```

3.9.3 Prerequisites for HTML

To run the HTML documentation build tool chain, Python 3.8 or later, git, doxygen, and virtualenv have to be installed locally. Here are instructions for common setups:

Ubuntu

```
sudo apt-get install git doxygen
```

i Fedora or RHEL/AlmaLinux/RockyLinux (8.x or later)

```
sudo dnf install git doxygen
```

i macOS*Python 3*

If Python 3 is not available on your macOS system, you can download the latest Python 3 macOS package from <https://www.python.org> and install it. This will install both Python 3 and pip3.

3.9.4 Prerequisites for PDF

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with support for PDFLaTeX and a selection of LaTeX styles/packages are required. Apart from LaTeX packages that are usually installed by default, the following packages are required:

ams-math	any-size	babel	capt-of	cmap	dvipng	ellipse	fncy-chap	fontawesome	framed	geome-try
gyre	hyper-ref	hyp-cap	needspace	pict2e	times	tabu-lary	titlesec	upquote	wrap-fig	xindy

To run the PDFLaTeX translation the `latexmk` script needs to be installed as well.

3.9.5 Prerequisites for ePUB and MOBI

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with a few add-on LaTeX packages as well as the `dvipng` tool are required to convert embedded math expressions transparently into embedded images.

For converting the generated ePUB file to a MOBI format file (for e-book readers, like Kindle, that cannot read ePUB), you also need to have the `ebook-convert` tool from the “calibre” software installed. <https://calibre-ebook.com/> Typing `make mobi` will first create the ePUB file and then convert it. On the Kindle readers in particular, you also have support for PDF files, so you could download and view the PDF version as an alternative.

3.9.6 Instructions for Developers

When adding new styles or options to the LAMMPS code, corresponding documentation is required and either existing files in the `src` folder need to be updated or new files added. These files are written in `reStructuredText` markup for translation with the Sphinx tool.

Testing your contribution

Before contributing any documentation, please check that both the HTML and the PDF format documentation can translate without errors and that there are no spelling issues. This is done with `make html`, `make pdf`, and `make spelling`, respectively.

Fast and approximate translation to HTML

Translating the full manual to HTML or PDF can take a long time. Thus there is a fast and approximate way to translate the reStructuredText to HTML as a quick-n-dirty way of checking your manual page.

This translation uses [Pandoc](#) instead of Sphinx and thus all special Sphinx features (cross-references, advanced tables, embedding of Python docstrings or doxygen documentation, and so on) will not render correctly. Most embedded math should render correctly. This is a **very fast** way to check the syntax and layout of a documentation file translated to HTML while writing or updating it.

To translate **all** manual pages, you can type `make fasthtml` at the command line. The translated HTML files are then in the `fasthtml` folder. All subsequent `make fasthtml` commands will only translate `.rst` files that have been changed. The `make fasthtml` command can be parallelized with `make` using the `-j` flag. You can also directly translate only individual pages: e.g. to translate only the `doc/src/pair_lj.rst` page type `make fasthtml/pair_lj.html`

After writing the documentation is completed, you will still need to verify with `make html` and `make pdf` that it translates correctly in both formats.

Tests for consistency, completeness, and other known issues

Please also check the output to the console for any warnings or problems. There will be multiple tests run automatically:

- A test for correctness of all anchor labels and their references
- A test that all LAMMPS packages (= folders with sources in `lammps/src`) are documented and listed. A typical warning shows the name of the folder with the suspected new package code and the documentation files where they need to be listed:

```
Found 88 packages
Package NEWPACKAGE missing in Packages_list.rst
Package NEWPACKAGE missing in Packages_details.rst
```

- A test that only standard, printable ASCII text characters are used. This runs the command `env LC_ALL=C grep -n '[^ ~]' src/*.rst` and thus prints all offending lines with filename and line number prepended to the screen. Special characters like Greek letters (α σ ϵ), super- or subscripts (x^2 U_{LJ}), mathematical expressions ($\frac{1}{2}N$ $x \rightarrow \infty$), or the Angstrom symbol ($\text{\AA}$) should be typeset with embedded LaTeX (like this `:math:\alpha` `\sigma` `\epsilon`, `:math:x^2` `\mathrm{E}_{LJ}`, `:math:\frac{1}{2}` `\mathrm{N}` `x\to\infty`, or `:math:\text{\AA}`).
- Embedded LaTeX is rendered in HTML output with [MathJax](#) and in PDF output by passing the embedded text to LaTeX. Some care has to be taken, though, since there are limitations which macros and features can be used in either mode, so it is recommended to always check whether any new or changed documentation does translate and render correctly with either output.
- A test whether all styles are documented and listed in their respective overview pages. A typical output with warnings looks like this:

```
Parsed style names w/o suffixes from C++ tree in ../src:
Angle styles:      21      Atom styles:      24
Body styles:       3      Bond styles:      17
Command styles:    41      Compute styles:   143
Dihedral styles:   16      Dump styles:     26
Fix styles:        223     Improper styles:  13
Integrate styles:  4      Kspace styles:   15
Minimize styles:   9      Pair styles:     234
Reader styles:     4      Region styles:    8
Compute style entry newcomp is missing or incomplete in Commands_compute.rst
Compute style entry newcomp is missing or incomplete in compute.rst
```

(continues on next page)

(continued from previous page)

```
Fix style entry newfix is missing or incomplete in Commands_fix.rst
Fix style entry newfix is missing or incomplete in fix.rst
Pair style entry new is missing or incomplete in Commands_pair.rst
Pair style entry new is missing or incomplete in pair_style.rst
Found 6 issue(s) with style lists
```

In addition, there is the option to run a spellcheck on the entire manual with `make spelling`. This requires a library called `enchant`. To avoid printing out *false positives* (e.g. keywords, names, abbreviations) those can be added to the file `lammps/doc/utils/sphinx-config/false_positives.txt`.

3.10 Notes for building LAMMPS on Windows

- *General remarks*
 - *Running Linux on Windows*
 - *Using GNU GCC ported to Windows*
 - *Using Visual Studio*
 - *Using Intel oneAPI compilers and libraries*
 - *Using a cross-compiler*
-

3.10.1 General remarks

LAMMPS is developed and tested primarily on Linux machines. The vast majority of HPC clusters and supercomputers today run on Linux as well. While portability to other platforms is desired, it is not always achieved. That is sometimes due to non-portable code in LAMMPS itself, but more often due to portability limitations of external libraries and tools required to build a specific feature or package. The LAMMPS developers are dependent on LAMMPS users giving feedback and providing assistance in resolving portability issues. This is particularly true for compiling LAMMPS on Windows, since this platform has significant differences in some low-level functionality. As of LAMMPS version 14 December 2021, large parts of LAMMPS can be compiled natively with the Microsoft Visual C++ Compilers. As of LAMMPS version 31 May 2022, also the Intel oneAPI compilers can compile large parts of LAMMPS natively on Windows. This is mostly facilitated by using the *Platform abstraction functions* in the `platform` namespace and CMake.

Before trying to build LAMMPS on Windows yourself, please consider the [pre-compiled Windows installer packages](#) and see if they are sufficient for your needs.

3.10.2 Running Linux on Windows

If it is necessary for you to compile LAMMPS on a Windows machine (e.g. because it is your main desktop), please also consider using a virtual machine software and compile and run LAMMPS in a Linux virtual machine, or - if you have a sufficiently up-to-date Windows 10 or Windows 11 installation - consider using the Windows subsystem for Linux. This optional Windows feature allows you to run the bash shell of a Linux system (Ubuntu by default) from within Windows and from there on, you can pretty much use that shell like you are running on a regular Ubuntu Linux machine (e.g. installing software via `apt-get` and more). For more details on that, please see [this tutorial](#).

3.10.3 Using a GNU GCC ported to Windows

One option for compiling LAMMPS on Windows natively is to install a Bash shell, Unix shell utilities, Perl, Python, GNU make, and a GNU compiler ported to Windows. The Cygwin package provides a unix/linux interface to low-level Windows functions, so LAMMPS can be compiled on Windows. The necessary (minor) modifications to LAMMPS are included, but may not always up-to-date for recently added functionality and the corresponding new code. A machine makefile for using cygwin for the old build system is provided. Using CMake for this mode of compilation is untested and not likely to work.

When compiling for Windows do **not** set the `-DLAMMPS_MEMALIGN` define in the `LMP_INC` makefile variable and add `-lwsck32 -lpsapi` to the linker flags in `LIB` makefile variable. Try adding `-static-libgcc` or `-static` or both to the linker flags when your resulting LAMMPS Windows executable complains about missing .dll files. The CMake configuration should set this up automatically, but is untested.

In case of problems, you are recommended to contact somebody with experience in using Cygwin. If you do come across portability problems requiring changes to the LAMMPS source code, or figure out corrections yourself, please report them on the [LAMMPS forum at MatSci](#), or file them as an issue or pull request on the LAMMPS GitHub project.

3.10.4 Using Microsoft Visual Studio

Following the integration of the *platform namespace* into the LAMMPS code base, portability of LAMMPS for native compilation on Windows using Visual Studio has been significantly improved. This has been tested with Visual Studio 2019 (aka version 16) and Visual Studio 2022 (aka version 17). We strongly recommend using Visual Studio 2022 version 17.1 or later. Not all features and packages in LAMMPS are currently supported out of the box, but a preset `cmake/presets/windows.cmake` is provided that contains the packages that have been compiled successfully so far. You **must** use the CMake based build procedure, since there is no support for GNU make or the Unix shell utilities required for the GNU make build procedure.

It is possible to use both the integrated CMake support of the Visual Studio IDE or use an external CMake installation (e.g. downloaded from [cmake.org](#)) to create build files and compile LAMMPS from the command-line.

Compilation via command-line and unit tests are checked automatically for the LAMMPS development branch through [GitHub Actions](#).

Note

Versions of Visual Studio before version 17.1 may scan the entire LAMMPS source tree and likely miss the correct master `CMakeLists.txt` and get confused since there are multiple files of that name in different folders but none in top level folder.

Please note, that for either approach CMake will create a so-called “*multi-configuration*” *build environment*, and the commands for building and testing LAMMPS must be adjusted accordingly.

The LAMMPS `cmake` folder contains a `CMakeSettings.json` file with build configurations for MSVC compilers and the MS provided Clang compiler package in Debug and Release mode.

To support running in parallel you can compile with OpenMP enabled using the OPENMP package or install Microsoft MPI (including the SDK) and compile LAMMPS with MPI enabled.

Note

This is work in progress and you should contact the LAMMPS developers via GitHub or the [LAMMPS forum at MatSci](#), if you have questions or LAMMPS specific problems.

3.10.5 Using Intel oneAPI Compilers and Libraries

Added in version 31May2022.

After installing the [Intel oneAPI](#) base toolkit and the HPC toolkit, it is also possible to compile large parts of LAMMPS natively on Windows using Intel compilers. The HPC toolkit provides two sets of C/C++ and Fortran compilers: the so-called “classic” compilers (`icl.exe` and `ifort.exe`) and newer, LLVM based compilers (`icx.exe` and `ifx.exe`). In addition to the compilers and their dependent modules, also the thread building blocks (TBB) and the math kernel library (MKL) need to be installed. Two presets (`cmake/presets/windows-intel-llvm.cmake` and `cmake/presets/windows-intel-classic.cmake`) are provided for selecting the LLVM based or classic compilers, respectively. The preset `cmake/presets/windows.cmake` enables compatible packages that are not dependent on additional features or libraries. You **must** use the CMake based build procedure and use Ninja as build tool. For compiling from the command prompt, thus both [CMake](#) and [Ninja-build](#) binaries must be installed. It is also possible to use Visual Studio, if it is started (`devenv.exe`) from a command prompt that has the Intel oneAPI compilers enabled. The Visual Studio settings file in the `cmake` folder contains configurations for both compiler variants in debug and release settings. Those will use the CMake and Ninja binaries bundled with Visual Studio, thus a separate installation is not required.

Known Limitations

In addition to portability issues with several packages and external libraries, the classic Intel compilers are currently not able to compile the googletest libraries and thus enabling the `-DENABLE_TESTING` option will result in compilation failure. The LLVM based compilers are compatible.

Note

This is work in progress and you should contact the LAMMPS developers via [GitHub](#) or the [LAMMPS forum at MatSci](#), if you have questions or LAMMPS specific problems.

3.10.6 Using a cross-compiler

If you need to provide custom LAMMPS binaries for Windows, but do not need to do the compilation on Windows, please consider using a Linux to Windows cross-compiler. This is how currently the Windows binary packages are created by the LAMMPS developers. Because of that, this is probably the currently best tested and supported way to build LAMMPS executables for Windows. A CMake preset selecting all packages compatible with this cross-compilation build is provided. The GPU package can only be compiled with OpenCL support. To compile with MPI support, a pre-compiled library and the corresponding header files are required. When building with CMake the matching package will be downloaded automatically, but MPI support has to be explicitly enabled with `-DBUILD_MPI=on`.

Please keep in mind, though, that this only applies to **compiling** LAMMPS. Whether the resulting binaries do work correctly is rarely tested by the LAMMPS developers. We instead rely on the feedback of the users of these pre-compiled LAMMPS packages for Windows. We will try to resolve issues to the best of our abilities if we become aware of them. However this is subject to time constraints and focus on HPC platforms.

3.11 Notes for saving disk space when building LAMMPS from source

LAMMPS is a large software project with a large number of source files, extensive documentation, and a large collection of example files. When downloading LAMMPS by cloning the [git repository from GitHub](#) this will by default also download the entire commit history since September 2006. Compiling LAMMPS will add the storage requirements of the compiled object files and libraries to the tally.

In a user account on an HPC cluster with filesystem quotas or in other environments with restricted disk space capacity it may be needed to reduce the storage requirements. Here are some suggestions:

- Create a so-called shallow repository by cloning only the last commit instead of the full project history by using `git clone git@github.com:lammps/lammps --depth=1 --branch=develop`. This reduces the downloaded size to about half. With `--depth=1` it is not possible to check out different versions/branches of LAMMPS, using `--depth=1000` will make multiple recent versions available at little extra storage needs (the entire git history had nearly 30,000 commits in fall 2021).
- Download a tar archive from either the [download section on the LAMMPS homepage](#) or from the [LAMMPS releases page on GitHub](#) these will not contain the git history at all.
- Build LAMMPS without the debug flag (remove `-g` from the machine makefile or use `-DCMAKE_BUILD_TYPE=Release`) or use the `strip` command on the LAMMPS executable when no more debugging would be needed. The `strip` command may also be applied to the LAMMPS shared library. The static library may be deleted entirely.
- Delete compiled object files and libraries after copying the LAMMPS executable to a permanent location. When using the traditional build process, one may use `make clean-<machine>` or `make clean-all` to delete object files in the `src` folder. For CMake based builds, one may use `make clean` or just delete the entire build folder.
- The folders containing the documentation tree (`doc`), the examples (`examples`) are not needed to build and run LAMMPS and can be safely deleted. Some files in the `potentials` folder are large and may be deleted, if not needed. The largest of those files (occupying about 120 MBytes combined) will only be downloaded on demand, when the corresponding package is installed.
- When using the CMake build procedure, the compilation can be done on a (local) scratch storage that will not count toward the quota. A local scratch file system may offer the additional benefit of speeding up creating object files and linking with libraries compared to a networked file system. Also with CMake (and unlike with the traditional `make`) it is possible to compile LAMMPS executables with different settings and packages included from the same source tree since all the configuration information is stored in the build folder. So it is not necessary to have multiple copies of LAMMPS.

3.12 Development build options

The build procedures in LAMMPS offers a few extra options which are useful during development, testing or debugging.

- *Monitor compilation flags (CMake only)*
- *Report missing and unneeded '#include' statements (CMake only)*
- *Address, Leak, Undefined Behavior, and Thread Sanitizer Support (CMake only)*
- *Code Coverage and Unit Testing (CMake only)*
 - *Unit tests for force styles*
 - *Unit tests for timestepping related fixes*
 - *Use custom linker for faster link times when `ENABLE_TESTING` is active*
 - *Tests for other components and utility functions*
 - *Collect and visualize code coverage metrics*
- *Coding style utilities*
- *Clang-format support*

- [GitHub command-line interface](#)

3.12.1 Monitor compilation flags (CMake only)

Sometimes it is necessary to verify the complete sequence of compilation flags generated by the CMake build. To enable a more verbose output during compilation you can use the following option.

```
-D CMAKE_VERBOSE_MAKEFILE=value    # value = no (default) or yes
```

Another way of doing this without reconfiguration is calling make with variable VERBOSE set to 1:

```
make VERBOSE=1
```

3.12.2 Report missing and unneeded '#include' statements (CMake only)

The conventions for how and when to use and order include statements in LAMMPS are documented in [LAMMPS programming style](#). To assist with following these conventions one can use the [Include What You Use](#) tool. This tool is still under development and for large and complex projects like LAMMPS there are some false positives, so suggested changes need to be verified manually. It is recommended to use at least version 0.16, which has much fewer incorrect reports than earlier versions. To install the IWYU toolkit, you need to have the clang compiler **and** its development package installed. Download the IWYU version that matches the version of the clang compiler, configure, build, and install it.

The necessary steps to generate the report can be enabled via a CMake variable during CMake configuration.

```
-D ENABLE_IWYU=value    # value = no (default) or yes
```

This will check if the required binary (include-what-you-use or iwyu) and python script (iwyu-tool or iwyu_tool or iwyu_tool.py) can be found in the path. The analysis can then be started with:

```
make iwyu
```

This may first run some compilation, as the analysis is dependent on recording all commands required to do the compilation.

3.12.3 Address, Leak, Undefined Behavior, and Thread Sanitizer Support (CMake only)

Compilers such as GCC and Clang support generating instrumented binaries which use different sanitizer libraries to detect problems in the code during run-time. They can detect issues like:

- [memory leaks](#)
- [undefined behavior](#)
- [data races](#)

Please note that this kind of instrumentation usually comes with a performance hit (but much less than using tools like [Valgrind](#) with a more low level approach). To enable these features, additional compiler flags need to be added to the compilation and linking stages. This is done through setting the ENABLE_SANITIZER variable during configuration. Examples:

```
-D ENABLE_SANITIZER=none      # no sanitizer active (default)
-D ENABLE_SANITIZER=address   # enable address sanitizer / memory leak checker
-D ENABLE_SANITIZER=hwaddress # enable hardware assisted address sanitizer / memory_
→leak checker
-D ENABLE_SANITIZER=leak      # enable memory leak checker (only)
-D ENABLE_SANITIZER=undefined # enable undefined behavior sanitizer
-D ENABLE_SANITIZER=thread    # enable thread sanitizer
```

3.12.4 Code Coverage and Unit Testing (CMake only)

The LAMMPS code is subject to multiple levels of automated testing when pull requests are submitted to [the LAMMPS repository on GitHub](#):

- Coding style compliance (see *Coding style utilities*)
- Integration testing (i.e. whether the code compiles on multiple platforms and with a variety of compilers and settings),
- Unit testing (i.e. whether certain functions or classes of the code produce the expected results for given inputs),
- Run testing (i.e. whether selected input decks can run to completion without crashing for multiple configurations),
- Regression testing (i.e. whether selected input examples reproduce the same results over a given number of steps and operations within a given error margin).

The tests are currently run as GitHub Actions and their configuration files are in the `.github/workflows/` folder of the LAMMPS git tree. The test status of these tests is reported with the corresponding pull request and the pull request *cannot* be merged without all tests passing.

In addition, there is a nightly test run using the `develop` branch to generate code coverage data for the included tests (see below), provided there have been changes to that tree. The results of this test run can be currently viewed at <https://download.lammps.org/coverage/tests.html>

Regression tests can also be performed locally with the *regression tester tool*. The tool checks if a given LAMMPS binary, when run with selected input examples produces, thermo output that is consistent with the provided log files. The script can be run in one pass over all available input files, but it can also first create multiple lists of inputs or folders that can then be run with multiple workers concurrently to speed things up. Another mode allows to do a quick check of inputs that contain commands that have changes in the current checkout branch relative to a git branch. This works similar to the two pass mode, but will select only shorter runs and no more than 100 inputs that are chosen randomly. This ensures that the quick test runs significantly faster compared to the full test run. These test runs can also be performed with instrumented LAMMPS binaries (see previous section).

The unit testing facility is integrated into the CMake build process of the LAMMPS source code distribution itself. It can be enabled by setting `-D ENABLE_TESTING=on` during the CMake configuration step. It requires the [YAML](#) library and matching development headers to compile (if those are not found locally a recent version of that library will be downloaded and compiled along with LAMMPS and the test programs) and will download and compile a specific version of the [GoogleTest](#) C++ test framework that is used to implement the tests. Those unit tests may be combined with memory access and leak checking with `valgrind` (see below for how to enable it). In that case, running so-called death tests will create a lot of false positives and thus they can be disabled by configuring compilation with the additional setting `-D SKIP_DEATH_TESTS=on`.

After compilation is complete, the unit testing is started in the build folder using the `ctest` command, which is part of the CMake software. The number of available tests will depend on the LAMMPS versions, installed LAMMPS packages, configuration settings, development environment, and operating system.

The output of the plain `ctest` command looks something like the following:

```

$ ctest
Test project /home/akohlmeier/compile/lammps/build-testing
Start 1: RunLammps
1/563 Test #1: RunLammps ..... Passed 0.28 sec
Start 2: HelpMessage
2/563 Test #2: HelpMessage ..... Passed 0.06 sec
Start 3: InvalidFlag
3/563 Test #3: InvalidFlag ..... Passed 0.06 sec
Start 4: Tokenizer
4/563 Test #4: Tokenizer ..... Passed 0.05 sec
Start 5: MemPool
5/563 Test #5: MemPool ..... Passed 0.05 sec
Start 6: ArgUtils
6/563 Test #6: ArgUtils ..... Passed 0.05 sec
[...]
Start 561: ImproperStyle:zero
561/563 Test #561: ImproperStyle:zero ..... Passed 0.07 sec
Start 562: TestMliapPyUnified
562/563 Test #562: TestMliapPyUnified ..... Passed 0.16 sec
Start 563: TestPairList
563/563 Test #563: TestPairList ..... Passed 0.06 sec

100% tests passed, 0 tests failed out of 563

Label Time Summary:
generated      = 0.85 sec*proc (3 tests)
noWindows      = 4.16 sec*proc (2 tests)
slow           = 78.33 sec*proc (67 tests)
unstable       = 28.23 sec*proc (34 tests)

Total Test time (real) = 132.34 sec

```

The `ctest` command has many options, the most important ones are:

Option	Function
<code>-V</code>	verbose output: display output of individual test runs
<code>-j <num></code>	parallel run: run <num> tests in parallel
<code>--test-dir <path></code>	provide path to the CMake build folder. By default <code>ctest</code> uses <code>.</code>
<code>-R <regex></code>	run subset of tests matching the regular expression <regex>
<code>-E <regex></code>	exclude subset of tests matching the regular expression <regex>
<code>-L <regex></code>	run subset of tests with a label matching the regular expression <regex>
<code>-LE <regex></code>	exclude subset of tests with a label matching the regular expression <regex>
<code>-N</code>	dry-run: display list of tests without running them
<code>-T memcheck</code>	run tests with valgrind memory checker (if available)

In its full implementation, the unit test framework will consist of multiple kinds of tests implemented in different programming languages (C++, C, Python, Fortran) and testing different aspects of the LAMMPS software and its features. The tests will adapt to the compilation settings of LAMMPS, so that tests will be skipped if prerequisite features are not available in LAMMPS.

i Work in Progress

The unit test framework was added in spring 2020 and is under active development. The coverage is not complete and will be expanded over time. Preference was given to test parts of the code base that are easy to test or commonly used.

Tests as shown by the `ctest` program are commands defined in the `CMakeLists.txt` files in the `unittest` directory tree. A few tests simply execute LAMMPS with specific command-line flags and check the output to the screen for expected content. A large number of unit tests are special tests programs using the [GoogleTest framework](#) and linked to the LAMMPS library that test individual functions or create a LAMMPS class instance, execute one or more commands and check data inside the LAMMPS class hierarchy. There are also tests for the C-library, Fortran, and Python module interfaces to LAMMPS. The Python tests use the Python “unittest” module in a similar fashion than the others use *GoogleTest*. These special test programs are structured to perform multiple individual tests internally and each of those contains several checks (aka assertions) for internal data being changed as expected.

Tests for force computing or modifying styles (e.g. styles for non-bonded and bonded interactions and selected fixes) are run by using a more generic test program that reads its input from files in YAML format. The YAML file provides the information on how to customized the test program to test a specific style and - if needed - with specific settings. To add a test for another, similar style (e.g. a new pair style) it is usually sufficient to add a suitable YAML file. [Detailed instructions for adding tests](#) are provided in the Programmer Guide part of the manual. A description of what happens during these tests is given below.

Unit tests for force styles

A large part of LAMMPS are different “styles” for computing non-bonded and bonded interactions selected through the *pair_style command*, *bond_style command*, *angle_style command*, *dihedral_style command*, *improper_style command*, and *kpace_style command* commands. Since these styles all share common interfaces, it is possible to write generic test programs that will assemble LAMMPS inputs from templates with different settings and call those common interfaces for small test systems with less than 100 atoms and compare the results with pre-recorded reference results. A test run is then a collection of multiple individual test runs, each with many comparisons to reference results based on template input files, individual command settings, relative error margins, and reference data stored in a YAML format file with `.yaml` suffix. Currently the programs `test_pair_style`, `test_bond_style`, `test_angle_style`, `test_dihedral_style`, and `test_improper_style` are implemented. They will compare forces, energies and (global) stress for all atoms after a run 0 calculation and after a few steps of MD with *fix nve*, each in multiple variants with different settings and also for multiple accelerated styles. If a prerequisite style or package is missing, the individual tests are skipped. All force style tests will be executed on a single MPI process, so using the CMake option `-D BUILD_MPI=off` can significantly speed up testing, since this will skip the MPI initialization for each test run.

Below is an example command and output for running a single test named `MolPairStyle:lj_cut` (argument to the `-R` option which selects tests by regular expression) and printing detailed output (the `-V` flag):

```
$ ctest -R MolPairStyle:lj_cut$ -V

[...]

    Start 199: MolPairStyle:lj_cut

199: Test command: /home/akohlmey/compile/lammps/build-test/test_pair_style "/home/
→ akohlmey/compile/lammps/unittest/force-styles/tests/mol-pair-lj_cut.yaml"

199: [=====] 9 tests from 1 test suite ran. (37 ms total)
199: [ PASSED  ] 8 tests.
199: [ SKIPPED ] 1 test, listed below:
199: [ SKIPPED ] PairStyle.gpu
1/1 Test #199: MolPairStyle:lj_cut ..... Passed    0.75 sec

The following tests passed:
    MolPairStyle:lj_cut

100% tests passed, 0 tests failed out of 1

Total Test time (real) =  0.76 sec

```

In this particular case, 8 out of 9 sets of tests were conducted, the tests for the `lj/cut/gpu` pair style were skipped, since the LAMMPS library linked to the test executable did not include the GPU package. To learn what individual tests are performed, you (currently) need to read the source code. You can use code coverage recording (see next section) to confirm how well the tests cover the code paths in the individual source files.

The force style test programs have a common set of options:

Option	Function
-g <newfile>	regenerate reference data in new YAML file
-u	update reference data in the original YAML file
-s	print error statistics for each group of comparisons
-v	verbose output: also print the executed LAMMPS commands

Since the `ctest` tool has no mechanism to directly pass flags to the individual test programs, a workaround has been implemented where these flags can be set in an environment variable `TEST_ARGS`. Example:

```
env TEST_ARGS=-s ctest -V -R BondStyle
```

This adds output with statistics for the computed error of the various tests relative to the reference (e.g. the per-atom force components).

To add a test for a style that is not yet covered, it is usually best to copy a YAML file for a similar style to a new file, edit the details of the style (how to call it, how to set its coefficients) and then run test command with either the `-g` and the replace the initial test file with the regenerated one or the `-u` option. The `-u` option will destroy the original file, if the generation run does not complete, so using `-g` is recommended unless the YAML file is fully tested and working. To have the new test file recognized by `ctest`, you need to re-run `cmake`. You can verify that the new test is available by checking the output of `ctest -N`.

Some of the force style tests are rather slow to run and some are very sensitive to small differences like CPU architecture, compiler tool chain, compiler optimization. Those tests are flagged with a “slow” and/or “unstable” label, and thus those tests can be selectively excluded with the `-LE` flag to `ctest` (see description of the most commonly used `ctest` flags) or specifically selected using the `-L` flag.

Recommendations and notes for YAML files

- The reference results should be recorded without any code optimization or related compiler flags enabled.
- The `epsilon` parameter defines the relative precision with which the reference results must be met. The test geometries often have high and low energy parts and thus a significant impact from floating-point math truncation errors is to be expected. Some functional forms and potentials are more noisy than others, so this parameter needs to be adjusted. Typically a value around $1.0\text{e-}13$ can be used, but it may need to be as large as $1.0\text{e-}8$ in some cases.
- The tests for pair styles from OPT, OPENMP and INTEL are performed with automatically rescaled epsilon to account for additional loss of precision from code optimizations and different summation orders.
- When compiling with (aggressive) compiler optimization, some tests are likely to fail. It is recommended to inspect the individual tests in detail to decide, whether the specific error for a specific property is acceptable (it often is), or this may be an indication of mis-compiled code (or an undesired large loss of precision due to significant reordering of operations and thus less error cancellation).

Unit tests for timestepping related fixes

A substantial subset of *fix styles* are invoked regularly during MD timestepping and manipulate per-atom properties like positions, velocities, and forces. For those fix styles, testing can be done in a very similar fashion as for force fields and thus there is a test program `test_fix_timestep` that shares a lot of code, properties, and command-line flags with the force field style testers described in the previous section.

This tester will set up a small molecular system run with verlet run style for 4 MD steps, then write a binary restart and continue for another 4 MD steps. At this point coordinates and velocities are recorded and compared to reference data. Then the system is cleared, restarted and running the second 4 MD steps again and the data is compared to the same reference. That is followed by another restart after which per atom type masses are replaced with per-atom masses and

the second 4 MD steps are repeated again and compared to the same reference. Also global scalar and vector data of the fix is recorded and compared. If the fix is a thermostat and thus the internal property `t_target` can be extracted, then this is compared to the reference data. The tests are repeated with the `respa` run style.

If the fix has a multi-threaded version in the OPENMP package, then the entire set of tests is repeated for that version as well.

For this to work, some additional conditions have to be met by the YAML format test inputs.

- The fix to be tested (and only this fix), should be listed in the `prerequisites:` section
- The fix to be tested must be specified in the `post_commands:` section with the fix-ID `test`. This section may contain other commands and other fixes (e.g. an instance of `fix nve` for testing a thermostat or force manipulation fix)
- For fixes that can tally contributions to the global virial, the line `fix_modify test virial yes` should be included in the `post_commands:` section of the test input.
- For thermostat fixes the target temperature should be ramped from an arbitrary value (e.g. 50K) to a pre-defined target temperature entered as `${t_target}`.
- For fixes that have thermostating support included, but do not have it enabled in the input (e.g. `fix rigid` with default settings), the `post_commands:` section should contain the line `variable t_target delete` to disable the target temperature ramp check to avoid false positives.

Use custom linker for faster link times when `ENABLE_TESTING` is active

When compiling LAMMPS with testing enabled, most test executables will need to be linked against the LAMMPS library and re-linked whenever there is a change to LAMMPS. Since this can be a very large library with many C++ objects when many packages are enabled, link times can become very long on machines that use the GNU BFD linker (e.g. Linux systems). Alternative linker programs like the `gold` linker, the `lld` linker of the LLVM project, or the `gold` linker available with GNU binutils can speed up this step substantially (in this order). CMake will by default test if any of the three can be enabled and use it when `ENABLE_TESTING` is active. The linker can also be selected manually through the `LAMMPS_CUSTOM_LINKER` CMake variable. Allowed values are `gold`, `lld`, `gold`, `bfd`, or `default`. The `default` option will use the system default linker otherwise, the linker is chosen explicitly. This option is only available for the GNU or Clang C++ compilers.

A small additional improvement can be obtained by building LAMMPS as a shared library with `-D BUILD_SHARED_LIBS=on`. But this is a small improvement due to reducing file I/O. Using an alternate linker has an algorithmic improvement through using symbol resolution algorithms with lower algorithmic complexity.

Tests for other components and utility functions

Additional tests that validate utility functions or specific components of LAMMPS are implemented as standalone executable which may, or may not require creating a suitable LAMMPS instance. These tests are more specific and do not require YAML format input files. To add a test, either an existing source file needs to be extended or a new file added, which in turn requires additions to the `CMakeLists.txt` file in the source folder.

Collect and visualize code coverage metrics

You can also collect code coverage metrics while running LAMMPS or the tests by enabling code coverage support during the CMake configuration:

```
-D ENABLE_COVERAGE=on # enable coverage measurements (off by default)
```

This will instrument all object files to write information about which lines of code were accessed during execution in files next to the corresponding object files. These can be post-processed to visually show the degree of coverage and which code paths are accessed and which are not taken. When working on unit tests (see above), this can be extremely

helpful to determine which parts of the code are not executed and thus what kind of tests are still missing. The coverage data is cumulative, i.e. new data is added with each new run.

Enabling code coverage will also add the following build targets to generate coverage reports after running the LAMMPS executable or the unit tests:

```
make gen_coverage_html # generate coverage report in HTML format
make gen_coverage_xml  # generate coverage report in XML format
make clean_coverage_html # delete folder with HTML format coverage report
make reset_coverage    # delete all collected coverage data and HTML output
```

These reports require GCOVR to be installed. The easiest way to do this to install it via pip:

```
python3 -m pip install gcovr
```

After post-processing with `gen_coverage_html` the results are in a folder `coverage_html` and can be viewed with a web browser. The images below illustrate how the data is presented. The coverage data for testing the current develop branch is generated nightly and currently available at: <https://download.lammps.org/coverage/>

Fig. 1: Top of the overview page

3.12.5 Coding style utilities

To aid with enforcing some of the coding style conventions in LAMMPS some additional build targets have been added. These require Python 3.5 or later and will only work properly on Unix-like operating and file systems.

The following options are available.

```
make check-whitespace # search for files with whitespace issues
make fix-whitespace   # correct whitespace issues in files
make check-homepage   # search for files with old LAMMPS homepage URLs
make fix-homepage      # correct LAMMPS homepage URLs in files
make check-errordocs   # search for deprecated error docs in header files
make fix-errordocs     # remove error docs in header files
make check-permissions # search for files with permissions issues
make fix-permissions   # correct permissions issues in files
make check-docs        # search for several issues in the manual
```

(continues on next page)

Fig. 2: Styles with good coverage

Fig. 3: Top of individual source page

```

515 // .....
516 init for one type pair i,j and corresponding j,i
517 .....
518
519 1000 double PairLJClass2::init_one(int i, int j)
520 {
521   // always mix epsilon,sigma via sixthpower rules
522   // mix distance via user-defined rule
523
524   // 1000 if (setflag[i][j] == 0) {
525   1000   epsilon[i][j] = 2.0 * sqrt(epsilon[i][i]*epsilon[j][j]) *
526   1000   pow(sigma[i][i],3.0) * pow(sigma[j][j],3.0) /
527   1000   (pow(sigma[i][i],6.0) + pow(sigma[j][j],6.0));
528   1000   sigma[i][j] =
529   1000   pow(0.5 * (pow(sigma[i][i],6.0) + pow(sigma[j][j],6.0)),1.0/6.0);
530   1000   cut[i][j] = mix_distance(cut[i][i],cut[j][j]);
531   }
532
533   1000   lj1[i][j] = 18.0 * epsilon[i][j] * pow(sigma[i][j],9.0);
534   1000   lj2[i][j] = 18.0 * epsilon[i][j] * pow(sigma[i][j],6.0);
535   1000   lj3[i][j] = 2.0 * epsilon[i][j] * pow(sigma[i][j],9.0);
536   1000   lj4[i][j] = 3.0 * epsilon[i][j] * pow(sigma[i][j],6.0);
537
538   // 1000 if (offset_flag && (cut[i][j] > 0.0)) {
539   1000   double ratio = sigma[i][j] / cut[i][j];
540   1000   offset[i][j] = epsilon[i][j] * (2.0*pow(ratio,9.0) - 3.0*pow(ratio,6.0));
541   } else offset[i][j] = 0.0;
542
543   1000   lj1[i][i] = lj1[i][j];
544   1000   lj2[i][i] = lj2[i][j];
545   1000   lj3[i][i] = lj3[i][j];
546   1000   lj4[i][i] = lj4[i][j];
547   1000   offset[i][i] = offset[i][j];
548
549   // check interior rRESPA cutoff
550
551   // 1000 if (cut_respa && cut[i][j] < cut_respa[3])
552   error->all(FLError,"Pair cutoff < Respa interior cutoff");
553
554   // compute i,j contribution to long-range tail correction
555   // count total # of atoms of type i and j via Allreduce
556
557   // 1000 if (tail_flag) {
558   int type = atom->type;
559   int nlocal = atom->nlocal;
560
561   double count[2],all[2];
562   count[0] = count[1] = 0.0;
563   for (int k = 0; k < nlocal; k++) {
564     if (type[k] == i) count[0] += 1.0;
565     if (type[k] == j) count[1] += 1.0;
566   }
567   MPI_Allreduce(count,all,2,MPI_DOUBLE,MPI_SUM,world);
568

```

Fig. 4: Source page with branches

(continued from previous page)

```

make check-version      # list files with pending release version tags
make check              # run all check targets from above

```

These should help to make source and documentation files conforming to some the coding style preferences of the LAMMPS developers.

3.12.6 Clang-format support

For the code in the `unittest` and `src` trees we are transitioning to use the *clang-format* tool to assist with having a consistent source code formatting style. The *clang-format* command bundled with Clang version 8.0 or later is required. The configuration is in files called `.clang-format` in the respective folders. Since the modifications from *clang-format* can be significant and - especially for “legacy style code” - they are not always improving readability, a large number of files currently have a `// clang-format off` at the top, which will disable the processing. As of fall 2021 all files have been either “protected” this way or are enabled for full or partial *clang-format* processing. Over time, the “protected” files will be refactored and updated so that *clang-format* may be applied to them as well.

It is recommended for all newly contributed files to use the clang-format processing while writing the code or do the coding style processing (including the scripts mentioned in the previous paragraph)

If *clang-format* is available, files can be updated individually with commands like the following:

```
clang-format -i some_file.cpp
```

3.12.7 GitHub command-line interface

GitHub has developed a [command-line tool](#) to interact with the GitHub website via a command called `gh`. This is extremely convenient when working with a Git repository hosted on GitHub (like LAMMPS). It is thus highly recommended to install it when doing LAMMPS development. To use `gh` you must be within a git checkout of a repository and you must obtain an authentication token to connect your checkout with a GitHub user. This is done with the command: `gh auth login` where you then have to follow the prompts. Here are some examples:

Command	Description
<code>gh pr list</code>	List currently open pull requests
<code>gh pr checks 404</code>	Shows the status of all checks for pull request #404
<code>gh pr view 404</code>	Shows the description and recent comments for pull request #404
<code>gh co 404</code>	Check out the branch from pull request #404; set up for pushing changes
<code>gh issue list</code>	List currently open issues
<code>gh issue view 430 --comments</code>	Shows the description and all comments for issue #430

The capabilities of the `gh` command are continually expanding, so for more details please see the documentation at <https://cli.github.com/manual/> or use `gh --help` or `gh <command> --help` for embedded help.

RUN LAMMPS

These pages explain how to run LAMMPS once you have *installed an executable* or *downloaded the source code and built an executable*. The *Commands* doc page describes how input scripts are structured and the commands they can contain.

4.1 Basics of running LAMMPS

LAMMPS is run from the command-line, reading commands from a file via the `-in` command-line flag, or from standard input. Using the `-in in.file` variant is recommended (see note below). The name of the LAMMPS executable is either `lmp` or `lmp_<machine>` with *<machine>* being the machine string used when compiling LAMMPS. This is required when compiling LAMMPS with the traditional build system (e.g. with `make mpi`), but optional when using CMake to configure and build LAMMPS:

```
lmp_serial -in in.file
lmp_serial < in.file
lmp -in in.file
lmp < in.file
/path/to/lammps/src/lmp_serial -i in.file
mpirun -np 4 lmp_mpi -in in.file
mpiexec -np 4 lmp -in in.file
mpirun -np 8 /path/to/lammps/src/lmp_mpi -in in.file
mpiexec -n 6 /usr/local/bin/lmp -in in.file
```

You normally run the LAMMPS command in the directory where your input script is located. That is also where output files are produced by default, unless you provide specific other paths in your input script or on the command-line. As in some of the examples above, the LAMMPS executable itself can be placed elsewhere.

Note

The redirection operator “<” will not always work when running in parallel with `mpirun` or `mpiexec`; for those systems the `-in` form is required.

As LAMMPS runs it prints info to the screen and a logfile named `log.lammps`. More info about output is given on the *screen and logfile output* page.

If LAMMPS encounters errors in the input script or while running a simulation it will print an ERROR message and stop or a WARNING message and continue. See the *Common Problems* page for a discussion of the various kinds of errors LAMMPS can or can’t detect, a list of all ERROR and WARNING messages, and what to do about them.

LAMMPS can run the same problem on any number of processors, including a single processor. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off due to using floating-point math can cause slight differences and an eventual divergence of molecular dynamics trajectories. See the [Errors common](#) page for discussion of this.

LAMMPS can run as large a problem as will fit in the physical memory of one or more processors. If you run out of memory, you must run on more processors or define a smaller problem. The amount of memory needed and how well it can be distributed across processors may vary based on the models and settings and commands used.

If you run LAMMPS in parallel via `mpirun`, you should be aware of the [processors](#) command, which controls how MPI tasks are mapped to the simulation box, as well as `mpirun` options that control how MPI tasks are assigned to physical cores of the node(s) of the machine you are running on. These settings can improve performance, though the defaults are often adequate.

For example, it is often important to bind MPI tasks (processes) to physical cores (processor affinity), so that the operating system does not migrate them during a simulation. If this is not the default behavior on your machine, the `mpirun` option `--bind-to core` (OpenMPI) or `-bind-to core` (MPICH) can be used.

If the LAMMPS command(s) you are using support multi-threading, you can set the number of threads per MPI task via the environment variable `OMP_NUM_THREADS`, before you launch LAMMPS:

```
export OMP_NUM_THREADS=2      # bash
setenv OMP_NUM_THREADS 2      # csh or tcsh
```

This can also be done via the [package](#) command or via the [-pk command-line switch](#) which invokes the package command. See the [package](#) command or [Speed](#) doc pages for more details about which accelerator packages and which commands support multi-threading.

You can experiment with running LAMMPS using any of the input scripts provided in the `examples` or `bench` directory. Input scripts are named `in.*` and sample outputs are named `log.*.P` where `P` is the number of processors it was run on.

Some of the examples or benchmarks require LAMMPS to be built with optional packages.

4.2 Command-line options

At run time, LAMMPS recognizes several optional command-line switches which may be used in any order. Either the full word or a one or two letter abbreviation can be used:

- `-e` or `-echo`
- `-h` or `-help`
- `-i` or `-in`
- `-k` or `-kokkos`
- `-l` or `-log`
- `-mdi`
- `-m` or `-mpicolor`
- `-c` or `-cite`
- `-nc` or `-nocite`
- `-nb` or `-nonbuf`
- `-pk` or `-package`

- *-p or -partition*
- *-pl or -plog*
- *-ps or -pscreen*
- *-ro or -reorder*
- *-r2data or -restart2data*
- *-r2dump or -restart2dump*
- *-r2info or -restart2info*
- *-sc or -screen*
- *-sr or skiprun*
- *-sf or -suffix*
- *-v or -var*

For example, the `lmp_mpi` executable might be launched as follows:

```
mpirun -np 16 lmp_mpi -v f tmp.out -l my.log -sc none -i in.alloy
mpirun -np 16 lmp_mpi -var f tmp.out -log my.log -screen none -in in.alloy
```

-echo style

Set the style of command echoing. The style can be *none* or *screen* or *log* or *both*. Depending on the style, each command read from the input script will be echoed to the screen and/or logfile. This can be useful to figure out which line of your script is causing an input error. The default value is *log*. The echo style can also be set by using the *echo* command in the input script itself.

-help

Print a brief help summary and a list of options compiled into this executable for each LAMMPS style (*atom_style*, *fix*, *compute*, *pair_style*, *bond_style*, etc). This can tell you if the command you want to use was included via the appropriate package at compile time. LAMMPS will print the info and immediately exit if this switch is used.

-in file

Specify a file to use as an input script. This is currently an optional but recommended switch when running LAMMPS in the default one-partition mode. If it is not specified, LAMMPS reads its script from standard input, typically from a script via I/O redirection; e.g. `lmp_linux < in.run`. With many MPI implementations (but not all of them), I/O redirection also works in parallel, but using the `-in` flag will *always* work.

This is a **required** switch when running LAMMPS in multi-partition mode (see below), since multiple pools of MPI processes cannot all read from standard input concurrently. The file name may be “none” for starting multi-partition calculations without reading an initial input file when using the library interface.

-kokkos on/off keyword/value ...

Explicitly enable or disable KOKKOS support, as provided by the KOKKOS package. Even if LAMMPS is built with this package, as described in the [the KOKKOS package page](#), this switch must be set to enable running with KOKKOS-enabled styles the package provides. If the switch is not set (the default), LAMMPS will operate as if the KOKKOS

package were not installed; i.e. you can run standard LAMMPS or with the GPU or OPENMP packages, for testing or benchmarking purposes.

Additional optional keyword/value pairs can be specified which determine how Kokkos will use the underlying hardware on your platform. These settings apply to each MPI task you launch via the `mpirun` or `mpiexec` command. You may choose to run one or more MPI tasks per physical node. Note that if you are running on a desktop machine, you typically have one physical node. On a cluster or supercomputer there may be dozens or 1000s of physical nodes.

Either the full word or an abbreviation can be used for the keywords. Note that the keywords do not use a leading minus sign. I.e. the keyword is “t”, not “-t”. Also note that each of the keywords has a default setting. Examples of when to use these options and what settings to use on different platforms is given on the [KOKKOS package](#) doc page.

- d or device
- g or gpus
- t or threads

device Nd

This option is only relevant if you built LAMMPS with `CUDA=yes`, you have more than one GPU per node, and if you are running with only one MPI task per node. The Nd setting is the ID of the GPU on the node to run on. By default Nd = 0. If you have multiple GPUs per node, they have consecutive IDs numbered as 0,1,2,etc. This setting allows you to launch multiple independent jobs on the node, each with a single MPI task per node, and assign each job to run on a different GPU.

gpus Ng Ns

This option is only relevant if you built LAMMPS with `CUDA=yes`, you have more than one GPU per node, and you are running with multiple MPI tasks per node (up to one per GPU). The Ng setting is how many GPUs you will use. The Ns setting is optional. If set, it is the ID of a GPU to skip when assigning MPI tasks to GPUs. This may be useful if your desktop system reserves one GPU to drive the screen and the rest are intended for computational work like running LAMMPS. By default Ng = 1 and Ns is not set.

Depending on which flavor of MPI you are running, LAMMPS will look for one of these 4 environment variables

SLURM_LOCALID (various MPI variants compiled with SLURM support)
MPT_LRank (HPE MPI)
MV2_COMM_WORLD_LOCAL_RANK (Mvapich)
OMPI_COMM_WORLD_LOCAL_RANK (OpenMPI)

which are initialized by the `srun`, `mpirun`, or `mpiexec` commands. The environment variable setting for each MPI rank is used to assign a unique GPU ID to the MPI task.

threads Nt

This option assigns Nt number of threads to each MPI task for performing work when Kokkos is executing in OpenMP or pthreads mode. The default is Nt = 1, which essentially runs in MPI-only mode. If there are Np MPI tasks per physical node, you generally want $N_p \times N_t$ = the number of physical cores per node, to use your available hardware optimally. This also sets the number of threads used by the host when LAMMPS is compiled with `CUDA=yes`.

Deprecated since version 22Dec2022.

Support for the “numa” or “n” option was removed as its functionality was ignored in Kokkos for some time already.

-log file

Specify a log file for LAMMPS to write status information to. In one-partition mode, if the switch is not used, LAMMPS writes to the file `log.lammps`. If this switch is used, LAMMPS writes to the specified file. In multi-partition mode, if the switch is not used, a `log.lammps` file is created with high-level status information. Each partition also writes to a `log.lammps.N` file where `N` is the partition ID. If the switch is specified in multi-partition mode, the high-level logfile is named “file” and each partition also logs information to a `file.N`. For both one-partition and multi-partition mode, if the specified file is “none”, then no log files are created. Using a *log* command in the input script will override this setting. Option `-plog` will override the name of the partition log files `file.N`.

-mdi ‘multiple flags’

This flag is only recognized and used when LAMMPS has support for the MolSSI Driver Interface (MDI) included as part of the *MDI* package. This flag is specific to the MDI library and controls how LAMMPS interacts with MDI. There are usually multiple flags that have to follow it and those have to be placed in quotation marks. For more information about how to launch LAMMPS in MDI client/server mode please refer to the *MDI Howto*.

-mpicolor color

If used, this must be the first command-line argument after the LAMMPS executable name. It is only used when LAMMPS is launched by an `mpirun` command which also launches another executable(s) at the same time (The other executable could be LAMMPS as well.). The *color* is an integer value which should be different for each executable (another application may set this value in a different way). LAMMPS and the other executable(s) perform an `MPI_Comm_split()` with their own colors to replace the `MPI_COMM_WORLD` communicator with a new communicator using the subset of MPI processes they are actually running on.

-cite style or file name

Select how and where to output a reminder about citing contributions to the LAMMPS code that were used during the run. Available keywords for styles are “both”, “none”, “screen”, or “log”. Any other keyword will be considered a file name to write the detailed citation info to instead of logfile or screen. Default is the “log” style where there is a short summary in the screen output and detailed citations in BibTeX format in the logfile. The option “both” selects the detailed output for both, “none”, the short output for both, and “screen” will write the detailed info to the screen and the short version to the log file. If a dedicated citation info file is requested, the screen and log file output will be in the short format (same as with “none”).

See the *citation page* for more details on how to correctly reference and cite LAMMPS.

-nocite

Disable generating a citation reminder (see above) at all.

-nonbuf

Added in version 15Sep2022.

Turn off buffering for screen and logfile output. For performance reasons, output to the screen and logfile is usually buffered, i.e. output is only written to a file if its buffer - typically 4096 bytes - has been filled. When LAMMPS crashes for some reason, however, that can mean that there is important output missing. With this flag the buffering can be turned off (only for screen and logfile output) and any output will be committed immediately. Note that when running in parallel with MPI, the screen output may still be buffered by the MPI library and this cannot be changed by LAMMPS. This flag should only be used for debugging and not for production simulations as the performance impact can be significant, especially for large parallel runs.

-package style args

Invoke the *package* command with style and args. The syntax is the same as if the command appeared at the top of the input script. For example `-package gpu 2` or `-pk gpu 2` is the same as *package gpu 2* in the input script. The possible styles and args are documented on the *package* doc page. This switch can be used multiple times, e.g. to set options for the INTEL and OPENMP packages which can be used together.

Along with the `-suffix` command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

-partition 8x2 4 5 ...

Invoke LAMMPS in multi-partition mode. When LAMMPS is run on P MPI processes and this switch is not used, LAMMPS runs in *one partition*, i.e. all P MPI processes run a single simulation with the same settings. If this switch *is* used, the P MPI processes are split into separate partitions and each partition runs its own simulation. The arguments to the switch specify the number of MPI processes in each partition. Arguments of the form $M \times N$ mean M partitions, each with N MPI processes. Arguments of the form N mean a single partition with N MPI processes. The sum of MPI processes in all partitions must equal P . Thus the command `-partition 8x2 4 5` has 10 partitions (eight with 2 MPI processes, one with 4 and one with 5) and runs on a total of 25 MPI processes.

Running with multiple partitions can be useful for running *multi-replica simulations*, where each replica runs on one or a few MPI processes.

Note

With MPI installed on a standalone machine (e.g. your desktop or laptop), you can run on more (virtual) MPI processes than you have physical processors (for testing purposes), but some MPI implementations (for instance *OpenMPI*) may require an additional command line flag to enable this so-called oversubscription. You may also have to disable *processor affinity* or else the performance may be exceptionally bad when oversubscribing processors.

To run multiple independent simulations from one input script, using multiple partitions, see the *Howto multiple* page. World- and universe-style *variables* are useful in this context.

-plog file

Specify the base name for the partition log files, so partition N writes log information to `file.N`. If *file* is *none*, then no partition log files are created. This overrides the filename specified in the `-log` command-line option. This option is useful when working with large numbers of partitions, allowing the partition log files to be suppressed (`-plog none`) or placed in a subdirectory (`-plog replica_files/log.lammps`). If this option is not used, the log file for partition N is `log.lammps.N` or whatever is specified by the `-log` command-line option.

-pscreen file

Specify the base name for the partition screen file, so partition N writes screen information to `file.N`. If *file* is *none*, then no partition screen files are created. This overrides the filename specified in the `-screen` command-line option. This option is useful when working with large numbers of partitions, allowing the partition screen files to be suppressed (`-pscreen none`) or placed in a subdirectory (`-pscreen replica_files/screen`). If this option is not used, the screen file for partition N is `screen.N` or whatever is specified by the `-screen` command-line option.

-reorder

This option has 2 forms:

```
-reorder nth N
-reorder custom filename
```

Reorder the ranks in the MPI communicator used to instantiate LAMMPS, in one of several ways. The original MPI communicator ranks all P MPI processes from 0 to $P-1$. The mapping of these ranks to physical processors is done by the MPI library before LAMMPS begins. It may be useful in some cases to alter the order of the ranks, for example to ensure that cores within each node are ranked in a desired order. Or when using the `run_style verlet/split` command with 2 partitions to ensure that a specific Kspace processor (in the second partition) is matched up with a specific set of processors in the first partition. See the [General tips](#) page for more details.

If the keyword `nth` is used with a setting N , then it means every N th processor will be moved to the end of the ranking. This is useful when using the `run_style verlet/split` command with 2 partitions via the `-partition` command-line switch. The first set of processors will be in the first partition, the second set in the second partition. The `-reorder` command-line switch can alter this so that the first N MPI processes in the first partition and one MPI process in the second partition will be ordered consecutively, e.g. as the cores on one physical node. This can boost performance. For example, if you use `-reorder nth 4` and `-partition 9 3` and you are running on 12 processors, the MPI process ranks will be reordered from

```
0 1 2 3 4 5 6 7 8 9 10 11
```

to

```
0 1 2 4 5 6 8 9 10 3 7 11
```

so that the processors in each partition will be

```
0 1 2 4 5 6 8 9 10
3 7 11
```

See the “processors” command for how to ensure processors from each partition could then be grouped optimally for quad-core nodes.

If the keyword is `custom`, then a file that specifies a permutation of the processor ranks is also specified. The format of the reorder file is as follows. Any number of initial blank or comment lines (starting with a “#” character) can be present. These should be followed by P lines of the form:

```
I J
```

where P is the number of processors LAMMPS was launched with. Note that if running in multi-partition mode (see the `-partition` switch above) P is the total number of MPI processes in all partitions. The I and J values describe a permutation of the P MPI process ranks. Every I and J should be values from 0 to $P-1$ inclusive. In the set of P I values, every MPI rank ID should appear exactly once. Ditto for the set of P J values. A single I, J pairing means that the physical processor with MPI rank I in the original MPI communicator will have rank J in the reordered MPI communicator.

Note that rank ordering can also be specified by many MPI implementations, either by environment variables that specify how to order physical processors, or by config files that specify what physical processors to assign to each MPI rank. The `-reorder` switch simply gives you a portable way to do this without relying on MPI itself. See the [processors file](#) command for how to output info on the final assignment of physical processors to the LAMMPS simulation domain.

-restart2data restartfile datafile keyword value ...

Convert the restart file into a data file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile
write_data datafile keyword value ...
```

The specified restartfile and/or datafile name may contain the wild-card character “*”. The restartfile name may also contain the wild-card character “%”. The meaning of these characters is explained on the [read_restart](#) and [write_data](#) doc pages. The use of “%” means that a parallel restart file can be read. Note that a filename such as file.* may need to be enclosed in quotes or the “*” character prefixed with a backslash (“\”) to avoid shell expansion of the “*” character.

The syntax following restartfile, namely

```
datafile keyword value ...
```

is identical to the arguments of the [write_data](#) command. See its documentation page for details. This includes its optional keyword/value settings.

-restart2dump restartfile group-ID dumpstyle dumpfile arg1 arg2 ...

Convert the restart file into a dump file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile
write_dump group-ID dumpstyle dumpfile arg1 arg2 ...
```

Note that the specified restartfile and dumpfile names may contain wild-card characters (“*” or “%”) as explained on the [read_restart](#) and [write_dump](#) doc pages. The use of “%” means that a parallel restart file and/or parallel dump file can be read and/or written. Note that a filename such as file.* may need to be enclosed in quotes or the “*” character prefixed with a backslash (“\”) to avoid shell expansion of the “*” character.

The syntax following restartfile, namely

```
group-ID dumpstyle dumpfile arg1 arg2 ...
```

is identical to the arguments of the [write_dump](#) command. See its documentation page for details. This includes what per-atom fields are written to the dump file and optional dump_modify settings, including ones that affect how parallel dump files are written, e.g. the *nfile* and *fileper* keywords. See the [dump_modify](#) page for details.

-restart2info restartfile keyword ...

Added in version 29Aug2024.

Write out some info about the restart file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile
info system group computes fixes
```

The specified restartfile name may contain the wild-card character “*”. The restartfile name may also contain the wild-card character “%”. The meaning of these characters is explained on the [read_restart](#) documentation. The use of “%” means that a parallel restart file can be read. Note that a filename such as file.* may need to be enclosed in quotes or the “*” character prefixed with a backslash (“\”) to avoid shell expansion of the “*” character.

Optional keywords may follow the `restartfile` argument. These must be valid keywords for the *info command*. The most useful ones - *system*, *group*, *computes*, and *fixes* - are already applied. Appending keywords like *coeffs* or *communication* may provide additional useful information stored in the restart file.

-screen file

Specify a file for LAMMPS to write its screen information to. In one-partition mode, if the switch is not used, LAMMPS writes to the screen. If this switch is used, LAMMPS writes to the specified file instead and you will see no screen output. In multi-partition mode, if the switch is not used, high-level status information is written to the screen. Each partition also writes to a screen.N file where N is the partition ID. If the switch is specified in multi-partition mode, the high-level screen dump is named “file” and each partition also writes screen information to a file.N. For both one-partition and multi-partition mode, if the specified file is “none”, then no screen output is performed. Option `-pscreen` will override the name of the partition screen files file.N.

-skiprun

Insert the command *timer timeout 0 every 1* at the beginning of an input file or after a *clear* command. This has the effect that the entire LAMMPS input script is processed without executing actual *run* or *minimize* and similar commands (their main loops are skipped). This can be helpful and convenient to test input scripts of long running calculations for correctness to avoid having them crash after a long time due to a typo or syntax error in the middle or at the end.

-suffix style args

Use variants of various styles if they exist. The specified style can be *gpu*, *intel*, *kk*, *omp*, *opt*, or *hybrid*. These refer to optional packages that LAMMPS can be built with, as described in *Accelerate performance*. The “gpu” style corresponds to the GPU package, the “intel” style to the INTEL package, the “kk” style to the KOKKOS package, the “opt” style to the OPT package, and the “omp” style to the OPENMP package. The hybrid style is the only style that accepts arguments. It allows for two packages to be specified. The first package specified is the default and will be used if it is available. If no style is available for the first package, the style for the second package will be used if available. For example, `-suffix hybrid intel omp` will use styles from the INTEL package if they are installed and available, but styles for the OPENMP package otherwise.

Along with the `-package` command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

As an example, all of the packages provide a *pair_style lj/cut* variant, with style names *lj/cut/gpu*, *lj/cut/intel*, *lj/cut/kk*, *lj/cut/omp*, and *lj/cut/opt*. A variant style can be specified explicitly in your input script, e.g. *pair_style lj/cut/gpu*. If the `-suffix` switch is used the specified suffix (*gpu*,*intel*,*kk*,*omp*,*opt*) is automatically appended whenever your input script command creates a new *atom style*, *pair style*, *fix*, *compute*, or *run style*. If the variant version does not exist, the standard version is created.

For the GPU package, using this command-line switch also invokes the default GPU settings, as if the command “package gpu 1” were used at the top of your input script. These settings can be changed by using the `-package gpu` command-line switch or the *package gpu* command in your script.

For the INTEL package, using this command-line switch also invokes the default INTEL settings, as if the command “package intel 1” were used at the top of your input script. These settings can be changed by using the `-package intel` command-line switch or the *package intel* command in your script. If the OPENMP package is also installed, the hybrid style with “intel omp” arguments can be used to make the omp suffix a second choice, if a requested style is not available in the INTEL package. It will also invoke the default OPENMP settings, as if the command “package omp 0” were used at the top of your input script. These settings can be changed by using the `-package omp` command-line switch or the *package omp* command in your script.

For the KOKKOS package, using this command-line switch also invokes the default KOKKOS settings, as if the command “package kokkos” were used at the top of your input script. These settings can be changed by using the `-package kokkos` command-line switch or the `package kokkos` command in your script.

For the OMP package, using this command-line switch also invokes the default OMP settings, as if the command “package omp 0” were used at the top of your input script. These settings can be changed by using the `-package omp` command-line switch or the `package omp` command in your script.

The `suffix` command can also be used within an input script to set a suffix, or to turn off or back on any suffix setting made via the command-line.

-var name value1 value2 ...

Specify a variable that will be defined for substitution purposes when the input script is read. This switch can be used multiple times to define multiple variables. “Name” is the variable name which can be a single character (referenced as `$x` in the input script) or a full string (referenced as `${abc}`). An *index-style variable* will be created and populated with the subsequent values, e.g. a set of filenames. Using this command-line option is equivalent to putting the line “variable name index value1 value2 ...” at the beginning of the input script. Defining an index variable as a command-line argument overrides any setting for the same index variable in the input script, since index variables cannot be re-defined.

See the *variable* command for more info on defining index and other kinds of variables and the *Parsing rules* page for more info on using variables in input scripts.

Note

Currently, the command-line parser looks for arguments that start with “-” to indicate new switches. Thus you cannot specify multiple variable values if any of them start with a “-”, e.g. a negative numeric value. It is OK if the first value1 starts with a “-”, since it is automatically skipped.

4.3 Screen and logfile output

As LAMMPS reads an input script, it prints information to both the screen and a log file about significant actions it takes to setup a simulation. When the simulation is ready to begin, LAMMPS performs various initializations, and prints info about the run it is about to perform, including the amount of memory (in MBytes per processor) that the simulation requires. It also prints details of the initial thermodynamic state of the system. During the run itself, thermodynamic information is printed periodically, every few timesteps. When the run concludes, LAMMPS prints the final thermodynamic state and a total run time for the simulation. It also appends statistics about the CPU time and storage requirements for the simulation. An example set of statistics is shown here:

```
Loop time of 0.942801 on 4 procs for 300 steps with 2004 atoms
```

```
Performance: 54.985 ns/day, 0.436 hours/ns, 318.201 timesteps/s, 637.674 katom-step/s
195.2% CPU use with 2 MPI tasks x 2 OpenMP threads
```

MPI task timing breakdown:

Section	min time	avg time	max time	%varavg	%total

Pair	0.61419	0.62872	0.64325	1.8	66.69
Bond	0.0028608	0.0028899	0.002919	0.1	0.31
Kspace	0.12652	0.14048	0.15444	3.7	14.90

Comm	0.026753	0.027593	0.028434	0.5	2.93
Output	0.00018341	0.00030942	0.00043542	0.0	0.03

```

Modify | 0.039117 | 0.039348 | 0.039579 | 0.1 | 4.17
Other  |          | 0.001041 |          |     | 0.11

```

```

Nlocal:          1002 ave          1006 max          998 min
Histogram: 1 0 0 0 0 0 0 0 0 1
Nghost:          8670.5 ave          8691 max          8650 min
Histogram: 1 0 0 0 0 0 0 0 0 1
Neighs:          354010 ave          357257 max          350763 min
Histogram: 1 0 0 0 0 0 0 0 0 1

```

```

Total # of neighbors = 708020
Ave neighs/atom = 353.30339
Ave special neighs/atom = 2.3403194
Neighbor list builds = 26
Dangerous builds = 0

```

The first section provides a global loop timing summary. The *loop time* is the total wall-clock time for the MD steps of the simulation run, excluding the time for initialization and setup (i.e. the parts that may be skipped with *run N pre no*). The *Performance* line is provided for convenience to help predict how long it will take to run a desired physical simulation and to have numbers useful for performance comparison between different simulation settings or system sizes. The *CPU use* line provides the CPU utilization per MPI task; it should be close to 100% times the number of OpenMP threads (or 1 if not using OpenMP). Lower numbers correspond to delays due to file I/O or insufficient thread utilization from parts of the code that have not been multi-threaded.

The *MPI task* section gives the breakdown of the CPU run time (in seconds) into major categories:

- *Pair* = non-bonded force computations
- *Bond* = bonded interactions: bonds, angles, dihedrals, impropers
- *Kspace* = long-range interactions: Ewald, PPPM, MSM
- *Neigh* = neighbor list construction
- *Comm* = inter-processor communication of atoms and their properties
- *Output* = output of thermodynamic info and dump files
- *Modify* = fixes and computes invoked by fixes
- *Other* = all the remaining time

For each category, there is a breakdown of the least, average and most amount of wall time any processor spent on this category of computation. The “%varavg” is the percentage by which the max or min varies from the average. This is an indication of load imbalance. A percentage close to 0 is perfect load balance. A large percentage is imbalance. The final “%total” column is the percentage of the total loop time is spent in this category.

When using the *timer full* setting, an additional column is added that also prints the CPU utilization in percent. In addition, when using *timer full* and the *package omp* command are active, a similar timing summary of time spent in threaded regions to monitor thread utilization and load balance is provided. A new *Thread timings* section is also added, which lists the time spent in reducing the per-thread data elements to the storage for non-threaded computation. These thread timings are measured for the first MPI rank only and thus, because the breakdown for MPI tasks can change from MPI rank to MPI rank, this breakdown can be very different for individual ranks. Here is an example output for this section:

```

Thread timings breakdown (MPI rank 0):
Total threaded time 0.6846 / 90.6%

```

Section	min time	avg time	max time	%varavg	%total
Pair	0.5127	0.5147	0.5167	0.3	75.18
Bond	0.0043139	0.0046779	0.0050418	0.5	0.68
Kspace	0.070572	0.074541	0.07851	1.5	10.89
Neigh	0.084778	0.086969	0.089161	0.7	12.70
Reduce	0.0036485	0.003737	0.0038254	0.1	0.55

The third section above lists the number of owned atoms (Nlocal), ghost atoms (Nghost), and pairwise neighbors stored per processor. The max and min values give the spread of these values across processors with a 10-bin histogram showing the distribution. The total number of histogram counts is equal to the number of processors.

The last section gives aggregate statistics (across all processors) for pairwise neighbors and special neighbors that LAMMPS keeps track of (see the [special_bonds](#) command). This section will not always contain data, for example when there has not been a neighbor rebuild, or the neighbor list was constructed on the GPU or when a hybrid pair style was used and LAMMPS cannot determine a suitable (base) neighbor list to draw the statistics from.

The number of times neighbor lists were rebuilt is tallied, as is the number of potentially *dangerous* rebuilds. If atom movement triggered neighbor list rebuilding (see the [neigh_modify](#) command), then dangerous reneighborings are those that were triggered on the first timestep atom movement was checked for. If this count is non-zero you may wish to reduce the delay factor to ensure no force interactions are missed by atoms moving beyond the neighbor skin distance before a rebuild takes place.

If an energy minimization was performed via the [minimize](#) command, additional information is printed, e.g.

```
Minimization stats:
  Stopping criterion = linesearch alpha is zero
  Energy initial, next-to-last, final =
    -6372.3765206    -8328.46998942    -8328.46998942
  Force two-norm initial, final = 1059.36 5.36874
  Force max component initial, final = 58.6026 1.46872
  Final line search alpha, max atom move = 2.7842e-10 4.0892e-10
  Iterations, force evaluations = 701 1516
```

The first line prints the criterion that determined minimization was converged. The next line lists the initial and final energy, as well as the energy on the next-to-last iteration. The next 2 lines give a measure of the gradient of the energy (force on all atoms). The 2-norm is the “length” of this 3N-component force vector; the largest component (x, y, or z) of force (infinity-norm) is also given. Then information is provided about the line search and statistics on how many iterations and force-evaluations the minimizer required. Multiple force evaluations are typically done at each iteration to perform a 1d line minimization in the search direction. See the [minimize](#) page for more details.

If a [kspace_style](#) long-range Coulombics solver that performs FFTs was used during the run (PPPM, Ewald), then additional information is printed, e.g.

```
FFT time (% of Kspace) = 0.200313 (8.34477)
FFT Gflps 3d 1d-only = 2.31074 9.19989
```

The first line is the time spent doing 3d FFTs (several per timestep) and the fraction it represents of the total KSpace time (listed above). Each 3d FFT requires computation (3 sets of 1d FFTs) and communication (transposes). The total flops performed is $5N\log_2(N)$, where N is the number of points in the 3d grid. The FFTs are timed with and without the communication and a Gflop rate is computed. The 3d rate is with communication; the 1d rate is without (just the 1d FFTs). Thus you can estimate what fraction of your FFT time was spent in communication, roughly 75% in the example above.

4.4 Error message output

Depending on the error function arguments when it is called in the source code, there will be one to four lines of error output.

4.4.1 A single line

The line starts with “ERROR: “, followed by the error message and information about the location in the source where the error function was called in parenthesis on the right (here: line 131 of the file `src/fix_print.cpp`). Example:

```
ERROR: Fix print timestep variable never returned a bad timestep: 9900 (src/fix_print.
→cpp:131)
```

4.4.2 Two lines

In addition to the single line output, also the last line of the input will be repeated. If a command is spread over multiple lines in the input using the continuation character ‘&’, then the error will print the entire concatenated line. For readability all whitespace is compressed to single blanks. Example:

```
ERROR: Unrecognized fix style 'printf' (src/modify.cpp:924)
Last input line: fix 0 all printf v_nevery "Step: $(step) ${step}"
```

4.4.3 Three lines

In addition to the two line output from above, a third line is added that uses caret character markers ‘^’ to indicate which “word” in the input failed. Example:

```
ERROR: Illegal fix print never value -100; must be > 0 (src/fix_print.cpp:41)
Last input line: fix 0 all print -100 "Step: $(step) ${step}"
                   ^ ^ ^ ^
```

4.4.4 Four lines

The three line output is expanded to four lines, if the input is modified through input pre-processing, e.g. when substituting variables. Now the last command is printed once in the original form and a second time after substitutions are applied. The caret character markers ‘^’ are applied to the second version. Example:

```
ERROR: Illegal fix print never value -100; must be > 0 (src/fix_print.cpp:41)
Last input line: fix 0 all print ${nevery} 'Step: $(step) ${step}'
--> parsed line: fix 0 all print -100 "Step: $(step) ${step}"
                   ^ ^ ^ ^
```

4.5 File formats used by LAMMPS

This page provides a general overview of the kinds of files and file formats that LAMMPS is reading and writing.

On this page

- [Character Encoding](#)

- *Restart File*
- *JSON Dump Files*

4.5.1 Character Encoding

For processing text files, the LAMMPS source code assumes [ASCII character encoding](#) which represents the digits 0 to 9, the lower and upper case letters a to z, some common punctuation and other symbols and a few whitespace characters including a regular “space character”, “line feed”, “carriage return”, “tabulator”. These characters are all represented by single bytes with a value smaller than 128 and only 95 of those 128 values represent printable characters. This list is sufficient to represent most English text, but misses accented characters or umlauts or Greek symbols and more.

Modern text often uses [UTF-8 character encoding](#) instead. This encoding is a way to represent many more different characters as defined by the Unicode standard. UTF-8 is compatible with ASCII, since the first 128 values are identical with the ASCII encoding. It is important to note, however, that there are Unicode characters that *look* similar to ASCII characters, but have a different binary representation. As a general rule, these characters may not be correctly recognized by LAMMPS. For some parts of LAMMPS’ text processing, translation tables with known “lookalike” characters are used. The tables are used to substitute non-ASCII characters with their ASCII equivalents. Non-ASCII lookalike characters are often used by web browsers or PDF viewers to improve the readability of text. Thus, when using copy and paste to transfer text from such an application to your input file, you may unintentionally create text that is not exclusively using ASCII encoding and may cause errors when LAMMPS is trying to read it.

Lines with non-printable and non-ASCII characters in text files can be detected for example with a (Linux) command like the following:

```
env LC_ALL=C grep -n '[^ --]' some_file.txt
```

4.5.2 Number Formatting

Different countries and languages have different conventions to format numbers. While in some regions commas are used for fractions and points to indicate thousand, million and so on, this is reversed in other regions. Modern operating systems have facilities to adjust input and output accordingly that are collectively referred to as “native language support” (NLS). The exact rules are often applied according to the value of the `$LANG` environment variable (e.g. “en_US.utf8” for English text in UTF-8 encoding).

For the sake of simplicity of the implementation and transferability of results, LAMMPS does not support this and instead expects numbers being formatted in the generic or “C” locale. The “C” locale has no punctuation for thousand, million and so on and uses a decimal point for fractions. One thousand would be represented as “1000.0” and not as “1,000.0” nor as “1.000,0”. Having native language support enabled for a locale other than “C” will result in different behavior when converting or formatting numbers that can trigger unexpected errors.

LAMMPS also only accepts integer numbers when an integer is required, so using floating point equivalents like “1.0” are not accepted; you *must* use “1” instead.

For floating point numbers in scientific notation, the Fortran double precision notation “1.1d3” is not accepted; you have to use “1100”, “1100.0” or “1.1e3”.

4.5.3 Input File

A LAMMPS input file is a text file with commands. It is read line-by-line and each line is processed *immediately*. Before looking for commands and executing them, there is a pre-processing step where comments (non-quoted text starting with a pound sign ‘#’) are removed, `${variable}` and `$(expression)` constructs are expanded or evaluated, and lines that end in the ampersand character ‘&’ are combined with the next line (similar to Fortran 90 free-format source code). After the pre-processing, lines are split into “words” and evaluated. The first word must be a *command* and all following words are arguments. Below are some example lines:

```
# full line comment

# some global settings
units          lj
atom_style      atomic
# ^^ command   ^^ argument(s)

variable        x index 1      # may be overridden from command line with -var x <value>
variable        xx equal 20*$x  # variable "xx" is always 20 times "x"

lattice          fcc 0.8442

# example of a command written across multiple lines
# the "region" command uses spacing from "lattice" command, unless "units box" is
→specified
region          box block 0.0 ${xx} &
                  0.0 40.0 &
                  0.0 30.0

# create simulation box and fill with atoms according to lattice setting
create_box      1 box
create_atoms    1 box

# set force field and parameters
mass           1 1.0
pair_style      lj/cut 2.5
pair_coeff      1 1 1.0 1.0 2.5

# run simulation
fix            1 all nve
run            1000
```

The pivotal command in this example input is the *create_box* command. It defines the simulation system and many parameters that go with it: units, atom style, number of atom types (and other types) and more. Those settings are *locked in* after the box is created. Commands that change these kind of settings are only allowed **before** a simulation box is created and many other commands are only allowed **after** the simulation box is defined (e.g. *pair_coeff*). Very few commands (e.g. *pair_style*) may be used in either part of the input. The *read_data* and *read_restart* commands also create the system box and thus have a similar pivotal function.

The LAMMPS input syntax has minimal support for conditionals and loops, but if more complex operations are required, it is recommended to use the library interface, e.g. *from Python using the LAMMPS Python module*.

There is a frequent misconception about the *if* command: this is a command for conditional execution **outside** a run or minimization. To trigger actions on specific conditions **during** a run is a non-trivial operation that usually requires adopting one of the available “fix” commands or creating a new “fix” command.

LAMMPS commands change the internal state and thus the order of commands matters and reordering them can produce different results. For example, the region defined by the *region* command in the example above depends on

the *lattice setting* and thus its dimensions will be different depending on the order of the two commands.

Each line must have an “end-of-line” character (line feed or carriage return plus line feed). Some text editors do not automatically insert one which may cause LAMMPS to ignore the last command. It is thus recommended to always have an empty line at the end of an input file.

The specific details describing how LAMMPS input is processed and parsed are explained in *Parsing rules for input scripts*.

4.5.4 Data File

A LAMMPS data file contains a description of a system suitable for reading with the *read_data command*. Data files are commonly used for setting up complex molecular systems that can be difficult to achieve with the commands *create_box* and *create_atoms* alone. Also, data files can be used as a portable alternatives to a *binary restart file*. A restart file can be converted into a data file from the *command line*.

Data files have a header section at the very beginning of the file and multiple titled sections such as “Atoms”, “Masses”, “Pair Coeffs”, and so on. Header keywords can only be used *before* the first title section.

The data file **always** starts with a “title” line, which will be **ignored** by LAMMPS. Omitting the title line can lead to unexpected behavior because a line of the header with an actual setting may be ignored. In this case, the mistakenly ignored line often contains the “atoms” keyword, which results in LAMMPS assuming that there are no atoms in the data file and thus throwing an error on the contents of the “Atoms” section. The title line may contain some keywords that can be used by external programs to convey information about the system (included as comments), that is not required and not read by LAMMPS.

The line following a section title is also **ignored**. An error will occur if an empty line is not placed after a section title. The number of lines in titled sections depends on header keywords, like the number of atom types, the number of atoms, the number of bond types, the number of bonds, and so on. The data in those sections has to be complete. A special case are the “Pair Coeffs” and “PairIJ Coeffs” sections; the former is for force fields and pair styles that use mixing of non-bonded potential parameters, the latter for pair styles and force fields requiring explicit coefficients. Thus with N being the number of atom types, the “Pair Coeffs” section has N entries while “PairIJ Coeffs” has $N \cdot (N - 1)$ entries. Internally, these sections will be converted to *pair_coeff* commands. Thus the corresponding *pair style* must have been set *before* the *read_data command* reads the data file.

Data files may contain comments, which start with the pound sign ‘#’. There must be at least one blank between a valid keyword and the pound sign. Below is a simple example case of a data file for *atom style full*.

```
LAMMPS Title line (ignored)
# full line comment

      10 atoms # comment
      4 atom types

-36.840194 64.211560 xlo xhi

```

The common problem is processing the “Atoms” section, since its format depends on the *atom style* used, and that setting must be done in the input file *before* reading the data file. To assist with detecting incompatible data files, a comment is appended to the “Atoms” title indicating the atom style used (or intended) when *writing* the data file. For example, below is an “Atoms” section for *atom style charge*, which omits the molecule ID column.

```

Atoms # charge

    1      1      0.560  43.99993  58.52678  36.78550
    2      2     -0.270  45.10395  58.23499  35.86693
    3      3     -0.510  43.81519  59.54928  37.43995

    5      4      0.090  45.72261  59.13657  35.67007
    6      4      0.090  44.66624  58.09539  34.85538
    7      3     -0.470  43.28193  57.47427  36.91953
    8      4      0.070  42.07157  57.45486  37.62418
    9      1      0.510  42.19985  57.57789  39.12163
   10      1      0.510  41.88641  58.62251  39.70398
#  ^^atomID ^^type  ^^charge ^^xcoord  ^^ycoord  ^^zcoord

```

Another source of confusion about the “Atoms” section format is the ordering of columns. The three atom style variants *atom_style full*, *atom_style hybrid charge molecular*, and *atom_style hybrid molecular charge* all carry the same per-atom information. However, in data files, the Atoms section has the columns ‘Atom-ID Molecule-ID Atom-type Charge X Y Z’ for atom style full, but for hybrid atom styles the first columns are always ‘Atom-ID Atom-type X Y Z’ followed by any *additional* data added by the hybrid styles, for example, ‘Charge Molecule-ID’ for the first hybrid style and ‘Molecule-ID Charge’ in the second hybrid style variant. Finally, an alternative to a hybrid atom style is to use fix property/atom, e.g. to add molecule IDs to atom style charge. In this case the “Atoms” section is formatted according to atom style charge and a new section, “Molecules” is added that contains lines with ‘Atom-ID Molecule-ID’, one for each atom in the system. For adding charges to atom style molecular with fix property/atom, the “Atoms” section is now formatted according to the atom style and a “Charges” section is added.

4.5.5 Molecule File

Molecule files for use with the *molecule command* look quite similar to data files but they do not have a compatible format, i.e., one cannot use a data file as molecule file and vice versa. Below is a simple example for a water molecule (SPC/E model). Same as a data file, there is an ignored title line and you can use comments. However, there is no information about the number of types or the box dimensions. These parameters are set when the simulation box is created. Thus the header only has the count of atoms, bonds, and so on.

Molecule files have a header followed by sections (just as in data files), but the section names are different than those of a data file. There is no “Atoms” section and the section formats in molecule files is independent of the atom style. Its information is split across multiple sections, like “Coords”, “Types”, and “Charges”. Note that no “Masses” section is needed here. The atom masses are by default tied to the atom type and set with a data file or the *mass command*. A “Masses” section would only be required for atom styles with per-atom masses, e.g. atom style sphere, where in data files you would provide the density and the diameter instead of the mass.

Since the entire file is a ‘molecule’, LAMMPS will assign a new molecule-ID (if supported by the atom style) when atoms are instantiated from a molecule file, e.g. with the *create_atoms command*. It is possible to include a “Molecules” section to indicate that the atoms belong to multiple ‘molecules’. Atom-IDs and molecule-IDs in the molecule file are relative for the file (i.e. starting from 1) and will be translated into actual atom-IDs also when the atoms from the molecule are created.

```
# Water molecule. SPC/E model.
```

```
3 atoms
2 bonds
1 angles
```

Coords

```
1      1.12456    0.09298    1.27452
2      1.53683    0.75606    1.89928
3      0.49482    0.56390    0.65678

```
1      -0.8472
2       0.4236
3       0.4236
```

(continues on next page)

(continued from previous page)

Bonds

```
1  1      1      2
2  1      1      3
```

Angles

```
1  1      2      1      3
```

There are also optional sections, e.g. about *SHAKE* and *special bonds*. Those sections are only needed if the molecule command is issued *before* the simulation box is defined. Otherwise, the molecule command can derive the required settings internally.

4.5.6 Restart File

LAMMPS restart files are binary files and not available in text format. They can be identified by the first few bytes that contain the (C-style) string `Lammps Restart` as *magic string*. This string is followed by a 16-bit integer of the number 1 used for detecting whether the computer writing the restart has the same *endianness* as the computer reading it. If not, the file cannot be read correctly. This integer is followed by a 32-bit integer indicating the file format revision (currently 3), which can be used to implement backward compatibility for reading older revisions.

This information has been added to the *Unix “file” command’s* <https://www.darwinsys.com/file/> “magic” file so that restart files can be identified without opening them. If you have a fairly recent version, it should already be included. If you have an older version, the LAMMPS source package *contains a file with the necessary additions*.

The rest of the file is organized in sections of a 32-bit signed integer constant indicating the kind of content and the corresponding value (or values). If those values are arrays (including C-style strings), then the integer constant is followed by a 32-bit integer indicating the length of the array. This mechanism will read the data regardless of the ordering of the sections. Symbolic names of the section constants are in the `lmprestart.h` header file.

LAMMPS restart files are not expected to be portable between platforms or LAMMPS versions, but changes to the file format are rare.

4.5.7 JSON Dump Files

LAMMPS can print information about molecules and other sets of atoms during a run, in JSON format. Several fixes currently support dumping JSON files in the ‘molecules’ style, including *fix bond/react* and the *delete* keyword of *fix reaxff/species*. The JSON ‘dump molecules’ format lists sets of atoms in the style of the *JSON molecule file*, where more discussion of JSON schema can be found. Here is an generic example of a JSON output file that dumped one water molecule on the first timestep:

```
{
  "application": "LAMMPS",
  "units": "real",
  "format": "dump",
  "style": "molecules",
  "revision": 1,
  "timesteps": [
    {
      "timestep": 1,
      "molecules": [
        {
          "types": {
```

(continues on next page)

(continued from previous page)

```

        "format": ["atom-id", "type"],
        "data": [
            [1368, "H"],
            [1366, "O"],
            [1367, "H"]
        ]
    },
    "coords": {
        "format": ["atom-id", "x", "y", "z"],
        "data": [
            [1368, 26.787767440427466, 29.785528640296768, 25.
→85197353660144],
            [1366, 26.641801222582824, 29.868106247702887, 24.
→91285138212243],
            [1367, 25.69611192416744, 30.093425787807448, 24.
→914380215672846]
        ]
    }
}
]
}
]
}
}

```

The required first-level keys of the JSON format output are “application”, “format”, “style”, “revision”, and “timesteps”, and optional keys are “units” and “title”. The value of the “timesteps” key is an array of objects that contain data for each timestep on which a molecule was dumped, and the other first-level keys identify this JSON schema. The objects in “timesteps” contains two mandatory keys, “timestep” and “molecules”. The “molecules” key is an array of *LAMMPS molecule JSON* objects, and may contain other keys that contain metadata for each molecule. The “format” keys within molecule JSON objects are only printed once per output file, for brevity. The “atom-id” values are atom IDs from the simulation, and the “type” values are atom types. In the above example, the types were reported as strings corresponding to elements using *type labels*.

4.6 Running LAMMPS on Windows

To run a serial (non-MPI) executable, follow these steps:

- Install a LAMMPS installer package from <https://packages.lammps.org/windows.html>
- Open the “Command Prompt” or “Terminal” app.
- Change to the directory where you have your input script, (e.g. by typing: `cd “Documents”`).
- At the command prompt, type `lmp -in in.file.lmp`, where `in.file.lmp` is the name of your LAMMPS input script.

Note that the serial executable includes support for multi-threading parallelization from the styles in the OPENMP and KOKKOS packages. To run with 4 threads, you can type this:

```
lmp -in in.lj.lmp -pk omp 4 -sf omp
lmp -in in.lj.lmp -k on t 4 -sf kk
```

Alternately, you can also install a package with LAMMPS-GUI included and open the LAMMPS-GUI app (the package includes the command-line version of LAMMPS as well) and open the input file in the GUI and run it from there. For details on LAMMPS-GUI, see <https://lammps-gui.lammps.org/>

For the MS-MPI executables, which allow you to run LAMMPS under Windows in parallel using MPI rather than multi-threading, follow these steps.

Download and install the MS-MPI runtime package `mmpisetup.exe` from <https://www.microsoft.com/en-us/download/details.aspx?id=105289> (Note that the `mmpisdk.msi` is **only** required for **compilation** of LAMMPS from source on Windows using Microsoft Visual Studio). After installation of MS-MPI perform a reboot.

Then you can run the executable in serial like in the example above or in parallel using MPI with one of the following commands:

```
mpiexec -localonly 4 lmp -in in.file.lmp
mpiexec -np 4 lmp -in in.file.lmp
```

where `in.file.lmp` is the name of your LAMMPS input script. For the latter case, you may be prompted to enter the password that you set during installation of the MPI library software.

In this mode, output may not immediately show up on the screen, so if your input script takes a long time to execute, you may need to be patient before the output shows up.

Note that the parallel executable also includes OpenMP multi-threading through both the OPENMP and the KOKKOS package, which can be combined with MPI using something like:

```
mpiexec -localonly 2 lmp -in in.lj.lmp -pk omp 2 -sf omp
mpiexec -localonly 2 lmp -in in.lj.lmp -kokkos on t 2 -sf kk
```

MPI parallelization will work for *all* functionality in LAMMPS and in many cases the MPI parallelization is more efficient than multi-threading since LAMMPS was designed from the ground up for MPI parallelization using domain decomposition. Multi-threading is only available for selected styles and implemented on top of the MPI parallelization. Multi-threading is most useful for systems with large load imbalances when using domain decomposition and a smaller number of threads (≤ 8).

ERRORS

These doc pages describe many of the error and warning message you can encounter when using LAMMPS. The common problems include conceptual issues. The messages and warnings doc pages give complete lists of all the messages the code may generate, with additional details for many of them.

5.1 Common issues that are often regarded as bugs

The list below are some random notes on behavior of LAMMPS that is sometimes unexpected or even considered a bug. Most of the time, these are just issues of understanding how LAMMPS is implemented and parallelized. Please also have a look at the [Error details discussions page](#) that contains recommendations for tracking down issues and explanations for error messages that may sometimes be confusing or need additional explanations.

- A LAMMPS simulation typically has two stages, 1) issuing commands and 2) run or minimize. Most LAMMPS errors are detected in stage 1), others at the beginning of stage 2), and finally others like a bond stretching too far may or lost atoms or bonds may not occur until the middle of a run.
- If two LAMMPS runs do not produce the exact same answer on different machines or different numbers of processors, this is typically not a bug. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off can cause slight differences and eventual divergence of molecular dynamics phase space trajectories within a few 100s or few 1000s of timesteps. This can be triggered by different ordering of atoms due to different domain decompositions, but also through different CPU architectures, different operating systems, different compilers or compiler versions, different compiler optimization levels, different FFT libraries. However, the statistical properties of the two runs (e.g. average energy or temperature) should still be the same.
- If the [velocity](#) command is used to set initial atom velocities, a particular atom can be assigned a different velocity when the problem is run on a different number of processors or on different machines. If this happens, the phase space trajectories of the two simulations will rapidly diverge. See the discussion of the [loop](#) option in the [velocity](#) command for details and options that avoid this issue.
- Similarly, the [create_atoms](#) command generates a lattice of atoms. For the same physical system, the ordering and numbering of atoms by atom ID may be different depending on the number of processors.
- Some commands use random number generators which may be setup to produce different random number streams on each processor and hence will produce different effects when run on different numbers of processors. A commonly-used example is the [fix langevin](#) command for thermostating.
- LAMMPS tries to flag errors and print informative error messages so you can fix the problem. For most errors it will also print the last input script command that it was processing or even point to the keyword that is causing troubles. Of course, LAMMPS cannot figure out your physics or numerical mistakes, like choosing too big a timestep, specifying erroneous force field coefficients, or putting 2 atoms on top of each other! Also, LAMMPS does not know what you *intend* to do, but very strictly applies the syntax as described in the documentation. If you run into errors that LAMMPS does not catch that you think it should flag, please send an email to the [developers](#) or create a new topic on the dedicated [MatSci forum section](#).

- If you get an error message about an invalid command in your input script, you can determine what command is causing the problem by looking in the log.lammps file or using the *echo command* to see it on the screen. If you get an error like “Invalid ... style”, with ... being fix, compute, pair, etc, it means that you mistyped the style name or that the command is part of an optional package which was not compiled into your executable. The list of available styles in your executable can be listed by using the *-h command-line switch*. The installation and compilation of optional packages is explained on the *Build packages* doc page.
- For a given command, LAMMPS expects certain arguments in a specified order. If you mess this up, LAMMPS will often flag the error, but it may also simply read a bogus argument and assign a value that is valid, but not what you wanted. E.g. trying to read the string “abc” as an integer value of 0. Careful reading of the associated doc page for the command should allow you to fix these problems. In most cases, where LAMMPS expects to read a number, either integer or floating point, it performs a stringent test on whether the provided input actually is an integer or floating-point number, respectively, and reject the input with an error message (for instance, when an integer is required, but a floating-point number 1.0 is provided):

```
ERROR: Expected integer parameter instead of '1.0' in input script or data file
```

- Some commands allow for using variable references in place of numeric constants so that the value can be evaluated and may change over the course of a run. This is typically done with the syntax *v_name* for a parameter, where name is the name of the variable. On the other hand, immediate variable expansion with the syntax *\${name}* is performed while reading the input and before parsing commands,

Note

Using a variable reference (i.e. *v_name*) is only allowed if the documentation of the corresponding command explicitly says it is. Otherwise, you will receive an error message of this kind:

```
ERROR: Expected floating point parameter instead of 'v_name' in input script or
→data file
```

- Generally, LAMMPS will print a message to the screen and logfile and exit gracefully when it encounters a fatal error. When running in parallel this message may be stuck in an I/O buffer and LAMMPS will be terminated before that buffer is printed. In that case you can try adding the *-nonblock* or *-nb* command-line flag to turn off that buffering. Please note that this should not be used for production runs, since turning off buffering usually has a significant negative impact on performance (even worse than *thermo_modify flush yes*). Sometimes LAMMPS will print a WARNING to the screen and logfile and continue on; you can decide if the WARNING is important or not, but as a general rule do not ignore warnings that you not understand. A WARNING message that is generated in the middle of a run is only printed to the screen, not to the logfile, to avoid cluttering up thermodynamic output. If LAMMPS crashes or hangs without generating an error message first then it could be a bug (see *this section*).
- LAMMPS runs in the available memory a processor allows to be allocated. Most reasonable MD runs are compute limited, not memory limited, so this should not be a bottleneck on most platforms. Almost all large memory allocations in the code are done via C-style malloc’s which will generate an error message if you run out of memory. Smaller chunks of memory are allocated via C++ “new” statements. If you are unlucky you could run out of memory just when one of these small requests is made, in which case the code will crash or hang (in parallel).
- Illegal arithmetic can cause LAMMPS to run slow or crash. This is typically due to invalid physics and numerics that your simulation is computing. If you see wild thermodynamic values or NaN values in your LAMMPS output, something is wrong with your simulation. If you suspect this is happening, it is a good idea to print out thermodynamic info frequently (e.g. every timestep) via the *thermo* so you can monitor what is happening. Visualizing the atom movement is also a good idea to ensure your model is behaving as you expect.
- When running in parallel with MPI, one way LAMMPS can hang is because LAMMPS has come across an error condition, but only on one or a few MPI processes and not all of them. LAMMPS has two different “stop with

an error message” functions and the correct one has to be called or else it will hang.

5.2 Errors and warnings details

Many errors and warnings that LAMMPS outputs are self-explanatory and thus straightforward to resolve. However, there are also cases where there is no single cause or simple explanation that can be provided in a short message printed by LAMMPS. Therefore, more detailed discussions of such scenarios are provided here; first on a more general level and then for specific errors. In the latter cases, LAMMPS will output a short message and then provide a URL that links to a specific section on this page.

5.2.1 General troubleshooting advice

Below are suggestions that can help to understand the causes of problems with simulations leading to errors or unexpected results.

Create a small test system

Debugging problems often requires running a simulation many times with small modifications, thus it can be a huge time saver to first assemble a small test system input that has the same issue, but will take much less time until it triggers the error condition. Also, it will be easier to see what happens when visualizing the system or looking at output files.

Visualize your trajectory

To better understand what is causing problems, it is often very useful to visualize the system close to the point of failure. It may be necessary to have LAMMPS output trajectory frames rather frequently. To avoid gigantic files, you can use [dump_modify delay](#) to delay output until the critical section is reached, and you can use a smaller test system (see above).

Parallel versus serial

Issues where something is “lost” or “missing” often exhibit that issue *only* when running in parallel. That doesn’t mean there is no problem when running in serial, only the symptoms are not triggering an error. This may be because there is no domain decomposition with just one processor and thus all atoms are accessible, or it may be because the problem will manifest faster with smaller subdomains. Correspondingly, errors may be triggered faster with more processors and thus smaller sub-domains.

Segmentation Fault

A segmentation fault is an error reported by the **operating system** and not LAMMPS itself. It happens when a process tries to access a memory address that is not available. This can have **many** reasons: memory has not been allocated, a memory buffer is not large enough, a memory address is computed from an incorrect index, a memory buffer is used after it has been freed, some general memory corruption. When investigating a segmentation fault (aka segfault), it is important to determine which process is causing it; it may not always be LAMMPS. For example, some MPI library implementations report a segmentation fault from their “mpirun” or “mpiexec” command when the application has been terminated unexpectedly.

While a segmentation fault is likely an indication of a bug in LAMMPS, it need not always be; it can also be the consequence of too aggressive simulation settings. For time critical code paths, LAMMPS will assume the user has chosen the settings carefully and will not make any checks to avoid performance penalties.

A crucial step in resolving a segmentation fault is to identify the exact location in the code where it happens. Please see [Debugging crashes](#) for a couple of examples showing how to do this on a Linux machine. With this information – a simple way to reproduce the segmentation fault and the exact [LAMMPS version](#) and platform you are running on – you can contact the LAMMPS developers or post in the LAMMPS forum to get assistance.

Fast moving atoms

Fast moving atoms may be “lost” or “missing” when their velocity becomes so large that they can cross a sub-domain within one timestep. This often happens when atoms are too close, but atoms may also “move” too fast from sub-domain to sub-domain if the box changes rapidly. E.g. when setting a large initial box with [shrink-wrap boundary conditions](#) that collapses on the first step (in this case the solution is often using ‘m’ instead of ‘s’ as a boundary condition).

To reduce the impact of “close contacts”, one can remove those atoms or molecules with something like [delete_atoms overlap 0.1 all all](#). With periodic boundaries, a close contact pair of atoms may be on opposite sides of the simulation box. Another option would be to first run a minimization (aka quench) before starting the MD. Reducing the time step can also help. Many times, one just needs to “ease” the system into a balanced state and can then switch to more aggressive settings.

The speed of atoms during an MD run depends on the steepness of the potential function and their mass. Since the positions and velocities of atoms are computed with finite timesteps, the timestep needs to be small enough for stable numeric integration of the trajectory. If the timestep is too large during initialization (or other instances of extreme dynamics), using [fix nve/limit](#) or [fix dt/reset](#) temporarily can help to avoid too large updates or adapt the timestep according to the displacements.

Ignoring lost atoms

It is tempting to use the *thermo_modify lost ignore* to avoid LAMMPS aborting with an error on lost atoms. This setting should, however, *only* be used when atoms *should* leave the system. In general, ignoring a problem does not solve it.

Pressure, forces, positions becoming NaN or Inf

Some potentials can overflow or have a division by zero with close contacts or bad geometries (for the given force styles in use) leading to forces that can no longer be represented as numbers. Those will show as “NaN” or “Inf”. On most machines, the program will continue, but there is no way to recover from it and those NaN or Inf values will propagate.

If the “NaN” or “Inf” appears in the first simulation step, the most common cause is overlapping atoms. Note that when atoms are *very* close, this cannot be seen when visualizing the geometry, since the atoms are effectively sitting on top of each other. A good test is to insert a command like *delete_atoms 0.1 all all* and then monitor the output to see how many atoms are deleted, if any. A non-zero number would be an indication of overlapping atoms. Note that atoms can also overlap through periodic boundaries when the box dimensions are too small (e.g. determined by min/max position of atoms without padding).

So-called “*soft-core*” potentials or the “*soft*” *repulsive-only pair style* are less prone for this behavior (depending on the settings in use) and can be used at the beginning of a simulation. Also, single precision numbers can overflow much faster, so for the GPU, KOKKOS, or INTEL package it may be beneficial to run with double precision initially before switching to mixed or single precision for faster execution when the system has relaxed.

Communication cutoff

The communication cutoff determines the “overlap” between sub-domains and atoms in these regions are referred to in LAMMPS as “ghost atoms”. This region has to be large enough to contain all atoms of a bond, angle, dihedral, or improper with just one atom in the actual sub-domain. Typically, this cutoff is set to the largest cutoff from the *pair style(s)* plus the *neighbor list skin distance* and will typically be sufficient for all bonded interactions. But if the pair style cutoff is small (e.g. with a repulsive-only Lennard-Jones potential) this may not be enough. It is even worse if there is no pair style defined (or the pair style is set to “none”), since then there will be no ghost atoms created at all.

The communication cutoff can be set or adjusted with *comm_modify cutoff <value>*, but setting this too large will waste CPU time and memory. LAMMPS will print warnings in these cases. For bonds it uses some heuristic based on the equilibrium bond length, but that still may not be sufficient for cases where the force constants are small and thus bonds may be stretched very far.

Neighbor list settings

Every time LAMMPS rebuilds the neighbor lists, LAMMPS will also check for “lost” or “missing” atoms. Thus it can help to use very conservative *neighbor list settings* and then examine the neighbor list statistics if the neighbor list rebuild can be safely delayed. Rebuilding the neighbor list less frequently (i.e. through increasing the *delay* or *every*) setting has diminishing returns and increasing risks.

Units

A frequent cause for a variety of problems is due to using the wrong *units* settings for a particular potentials, especially when reading them from a potential file. Most of the (example) potentials bundled with LAMMPS have a “UNITS:” tag that allows LAMMPS to check if the units are consistent with what is intended, but potential files from publications or potential parameter databases may lack this metadata information and thus will not error out or warn when using the wrong setting. Most potential files usually use “metal” units, but some are parameterized for other settings, most notably *ReaxFF potentials* that use “real” units.

Also, individual parameters for *pair_coeff* commands taken from publications or other MD software may need to be converted and sometimes in unexpected ways. Thus some careful checking is recommended.

No error message printed

In some cases – especially when running in parallel with MPI – LAMMPS may stop without displaying an error. But the fact that nothing was displayed does not mean there was not an error message. Instead it is highly likely that the message was written to a buffer and LAMMPS was aborted before the buffer was output. Usually, output buffers are output for every line of output, but sometimes this is delayed until 4096 or 8192 bytes of output have been accumulated. This buffering for screen and logfile output can be disabled by using the *-nb* or *-nonbuf* command-line flag. This is most often needed when debugging crashing multi-replica calculations.

Errors before or after the simulation box is created

As critical step in a LAMMPS input is when the simulation box is defined, either with a *create_box* command, a *read_data* command, or a *read_restart* command. After this step, certain settings are locked in (e.g. units, or number of atom, bond, angle, dihedral, improper types) and cannot be changed after that. Consequently, commands that change such settings (e.g. *units*) are only allowed before the box is defined. Very few commands can be used before and after, like *pair_style* (but not *pair_coeff*). Most LAMMPS commands must be used after the simulation box is created.

Consequently, LAMMPS will stop with an error, if a command is used in the wrong place. This is not always obvious. So index or string style *variables* can be expanded anywhere in the input, but equal style (or similar) variables can only be expanded before the box is defined if they do not reference anything that cannot be defined before the box (e.g. a compute or fix reference or a thermo keyword).

Illegal ... command

These are catchall error messages that used to be used a *lot* in LAMMPS (also programmers are sometimes lazy). They usually include the name of the source file and the line where the error happened. This can be used to track down what caused the error (most often some form of syntax error) by looking at the source code. However, this has two disadvantages: 1. one has to check the source file from the exact same LAMMPS version, or else the line number would be different or the core may have been rewritten and that specific error does not exist anymore.

The LAMMPS developers are committed to replace these too generic error messages with more descriptive errors, e.g. listing *which* keyword was causing the error, so that it will be much simpler to look up the correct syntax in the manual (and without referring to the source code).

5.2.2 Unknown identifier in data file

This error happens when LAMMPS encounters a line of text with an unexpected keyword while *reading a data file*. This would be either header keywords or section header keywords. This is most commonly due to a mistyped keyword or due to a keyword that is inconsistent with the *atom style* used.

The header section informs LAMMPS how many entries or lines are expected in the various sections (like Atoms, Masses, Pair Coeffs, *etc.*) of the data file. If there is a mismatch, LAMMPS will either keep reading beyond the end of a section or stop reading before the section has ended. In that case the next line will not contain a recognized keyword.

Such a mismatch can also happen when the first line of the data is *not* a comment as required by the format, but a line with a valid header keyword. That would result in LAMMPS expecting, for instance, 0 atoms because the “atoms” header line is the first line and thus treated as a comment.

Another possibility to trigger this error is to have a keyword in the data file that corresponds to a fix (e.g. *fix cmap*) but the *read_data* command is missing the (optional) arguments that identify the fix and its header and section keywords. Alternatively, those arguments are inconsistent with the keywords in the data file.

5.2.3 Incorrect format in ... section of data file

This error happens when LAMMPS reads the contents of a section of a *data file* and the number of parameters in the line differs from what is expected. This most commonly happens when the atom style is different from what is expected for a specific data file since changing the atom style usually changes the format of the line.

This error can also occur when the number of entries indicated in the header of a data file (e.g. the number of atoms) is larger than the number of lines provided (e.g. in the corresponding Atoms section) causing LAMMPS to continue reading into the next section which has a completely different format.

5.2.4 Illegal variable command: expected X arguments but found Y

This error indicates that a variable command has either incorrectly formatted arguments or the wrong number of arguments. A common reason for this is that a variable expression contains whitespace, but is not enclosed in single or double quotes.

To explain, the LAMMPS input parser reads and processes lines. The resulting line is broken down into “words”. Those are usually individual commands, labels, names, and values separated by whitespace (a space or tab character). For “words” that may contain whitespace, they have to be enclosed in single (') or double (") quotes. The parser will then remove the outermost pair of quotes and pass that string as single argument to the variable command.

Thus missing quotes or accidental extra whitespace will trigger this error because the unquoted whitespace will result in the text being broken into more “words” than expected, i.e. the variable expression being split.

5.2.5 Out of range atoms - cannot compute ...

The PPPM (and also PPPMDisp and MSM) methods need to assemble a grid of electron density data derived from the (partial) charges assigned to the atoms. These charges are smeared out across multiple grid points (see *k_{space}_modify order*). When running in parallel with MPI, LAMMPS uses a *domain decomposition scheme* where each processor manages a subset of atoms and thus also a grid representing the density. The processor’s grid covers the actual volume of the sub-domain and some extra space corresponding to the *neighbor list skin*. These are then *combined and redistributed* for parallel processing of the long-range component of the Coulomb interaction.

The *Out of range atoms* error can happen when atoms move too fast, the neighbor list skin is too small, or the neighbor lists are not updated frequently enough. The smeared charges cannot then be fully assigned to the density grid for all atoms. LAMMPS checks for this condition and stops with an error. Most of the time, this is an indication of a system with very high forces, often at the beginning of a simulation or when boundary conditions are changed. The error becomes more likely with more MPI processes.

There are multiple options to explore for avoiding the error. The best choice depends strongly on the individual system, and often a combination of changes is required. For example, more conservative MD parameter settings can be used (larger neighbor skin, shorter time step, more frequent neighbor list updates). Sometimes, it helps to revisit the system generation and avoid close contacts when building it. Otherwise one can use the *delete_atoms overlap* command to delete those close contact atoms or run a minimization before the MD. It can also help to temporarily use a cutoff-Coulomb pair style and no kspace style until the system has somewhat equilibrated and then switch to the long-range solver.

5.2.6 Bond (or angle, dihedral, improper, cmap, or shake) atoms missing

The second atom needed to compute a particular bond (or the third or fourth atom for angle, dihedral, or improper) is missing on the indicated timestep and processor. Typically, this is because the two bonded atoms have become too far apart relative to the communication cutoff distance for ghost atoms. By default, the communication cutoff is set by the pair cutoff. However, to accommodate larger distances between topologically connected atoms, it can be manually adjusted using *comm_modify* at the cost of increased communication and more ghost atoms. However, missing bond atoms may also indicate that there are unstable dynamics which caused the atoms to blow apart. In this scenario, increasing the communication distance will not solve the underlying issue. Rather, see *Fast moving atoms* and *Neighbor list settings* in the general troubleshooting section above for ideas to fix unstable dynamics.

If atoms are intended to be lost during a simulation (e.g. due to open boundary conditions or *fix evaporate*) such that two bonded atoms may be lost at different times from each other, this error can be converted to a warning or turned off using the *lost/bond* keyword in the *thermo_modify* command.

5.2.7 Non-numeric atom coords or pressure or box dimensions - simulation unstable

This error usually occurs due to overly aggressive simulation settings or issues with the system geometry or the potential. See *Pressure, forces, positions becoming NaN or Inf* above in the general troubleshooting section. This error is more likely to happen during equilibration, so it can help to do a minimization before or even add a second or third minimization after running a few equilibration MD steps. It also is more likely when directly using a Nose-Hoover (or other) barostat, and thus it may be advisable to run with only a thermostat for a bit until the potential energy has stabilized.

5.2.8 Fix used in ... not computed at compatible time

Many fix styles are invoked only every *nevery* timesteps, which means their data is only valid on those steps. When data from a fix is used as input for a compute, a dump, another fix, or thermo output, it must read that data at timesteps when the fix in question was invoked, i.e. on timesteps that are multiples of its *nevery* setting. If this is not the case, LAMMPS will stop with an error. To remedy this, it may be required to change the output frequency or the *nevery* setting of the fix.

5.2.9 Lost atoms ...

A simulation stopping with an error due to lost atoms can have multiple causes. By default, LAMMPS checks for whether the total number of atoms is consistent with the sum of atoms “owned” by MPI processors every time that thermodynamic output is written. In the majority of cases, lost atoms are unexpected and a result of extremely high velocities causing instabilities in the system. Such velocities can result from a variety of issues. For ideas on how to track down issues with unexpected lost atoms, see *Fast moving atoms* and *Neighbor list settings* in the general troubleshooting section above. In specific situations however, losing atoms is expected material behavior (e.g. with sputtering and surface evaporation simulations), and an unwanted crash can be avoided by changing the *thermo_modify lost* keyword from the default ‘error’ to ‘warn’ or ‘ignore’ (though heed the advice in *Ignoring lost atoms* above!).

5.2.10 Too many neighbor bins

The simulation box is or has become too large relative to the size of a neighbor bin (which in turn depends on the largest pair-wise cutoff by default) such that LAMMPS is unable to store the needed number of bins. This typically implies the simulation box has expanded too far. That can occur when some atoms move rapidly apart with shrink-wrap boundaries or when a fix (like fix deform or a barostat) excessively grows the simulation box. This can also happen if the largest pair-wise cutoff is small. In this case, the error can be avoided by using the *neigh_modify command* to either (a) set the bin width to a suitably large value or (b) use a hash table to store the bins for each atom. The latter option currently only supports the *multi* neighbor style and is intended for systems where there is a low particle density and a small cutoff. Namely, systems with very large ratios of minimum to maximum particle sizes/cutoffs. This may require adjustment of *atom sort settings*.

5.2.11 Unrecognized ... style ...

There are multiple variants of this error message. The most common case is that there is a typo or syntax error in the input file and the style name of a command was not found in the LAMMPS executable.

Another case is that the input is using the correct style command, but the LAMMPS executable in use was not compiled with the package containing that specific style. LAMMPS executables include tables of all available packages and styles in the distribution, and thus will print in this case a message indicating which package is missing. This indicates that the executable needs to be re-built after enabling the correct package. See the *LAMMPS build instructions* for more details on including packages. One can check if the expected package and style is present in the executable by running

it with the `-help` (or `-h`) flag on the command line. One common oversight, especially for LAMMPS users with limited experience in compiling software from source, is enabling the package but forgetting to rebuild or install the executable. One can also check the documentation for the style in question for a “Restrictions” section, which should indicate which requirements apply to a given command.

Finally, there is the case that the necessary package is included, but the missing style depends also on *another* style from a *different* package and *this* package is missing. In that case, LAMMPS does not know which package is missing, and it is necessary to check the documentation for the missing style in the manual.

If this error occurs with an executable that the user does not control (e.g., through a module on HPC clusters), the user will need to get in contact with the relevant person or people who can update the executable. In rare cases, there may be licensing or portability issues that prevent including a package in publicly accessible binaries or in a specific environment.

5.2.12 Energy or stress was not tallied by pair style

This warning can be printed by computes from the *TALLY* package. Those use a callback mechanism that only work for regular pair-wise additive pair styles like *Lennard-Jones*, *Morse*, *Born-Meyer-Huggins*, and similar. Such required callbacks have not been implemented for many-body potentials so one would have to implement them to add compatibility with these computes (which may be difficult to do in a generic fashion). Whether this warning indicates that contributions to the computed properties are missing depends on the groups used. At any rate, careful testing of the results is advised when this warning appears.

5.2.13 fmt::format_error

LAMMPS uses the `{fmt}` library for advanced string formatting tasks. This is similar to the `printf()` family of functions from the standard C library, but more flexible. If there is a bug in the LAMMPS code and the format string does not match the list of arguments or has some other error, this error message will be shown. You should contact the LAMMPS developers and report the bug as a [GitHub Bug Report Issue](#) along with sufficient information to easily reproduce it.

5.2.14 Substitution for illegal variable

A variable in an input script or a variable expression was not found in the list of valid variables. The most common reason for this is a typo somewhere in the input file such that the expression uses an invalid variable name. The second most common reason is omitting the curly braces for a direct variable with a name that is not a single letter. For example:

```
variable cutoff index 10.0
pair_style lj/cut ${cutoff} # this is correct
pair_style lj/cut $cutoff  # this is incorrect, LAMMPS looks for 'c' instead of 'cutoff'
variable c      index 5.0  # if $c is defined, LAMMPS substitutes only '$c' and reads:
→5ututoff
```

Another potential source of this error may be invalid command line variables (`-var` or `-v` argument) used when launching LAMMPS from an interactive shell or shell scripts. An uncommon source for this error is using the *next command* to advance through a list of values provided by an index style variable. If there is no remaining element in the list, LAMMPS will delete the variable and any following expansion or reference attempt will trigger the error.

Users with harder-to-track variable errors might also find reading the *Parsing rules for input scripts* helpful.

5.2.15 Bond atom missing in image check or box size check

This can be either an error or a warning depending on your *thermo_modify settings*. It is flagged in a part of the LAMMPS code where it updates the domain decomposition and before it builds the neighbor lists. It checks that both atoms of a bond are within the communication cutoff of a subdomain. It is usually caused by atoms moving too fast (see

the *paragraph on fast moving atoms*), or by the *communication cutoff being too small*, or by waiting too long between *sub-domain and neighbor list updates*.

5.2.16 Cannot use neighbor bins - box size << cutoff

LAMMPS is unable to build neighbor bins since the size of the box is much smaller than an interaction cutoff in at least one of its dimensions. Typically, this error is triggered when the simulation box has one very thin dimension. If a cubic neighbor bin had to fit exactly within the thin dimension, then an inordinate amount of bins would be created to fill space. This error can be avoided using the generally slower *nsq neighbor style* or by increasing the size of the smallest box lengths.

5.2.17 Did not assign all atoms correctly

This error happens most commonly when *reading a data file* under *non-periodic boundary conditions*. Only atoms with positions **inside** the simulation box will be read and thus any atoms outside the box will be skipped and the total atom count will not match, which triggers the error. This does not happen with periodic boundary conditions where atoms outside the principal box will be “wrapped” into the principal box and their image flags set accordingly.

Similar errors can happen with the *replicate command* or the *read_restart command*. In these cases the cause may be a problematic geometry, an insufficient communication cutoff, or a bug in the LAMMPS source code. In these cases it is advisable to set up *small test case* for testing and debugging. This will be required in case you need to get help from a LAMMPS developer.

5.2.18 Domain too large for neighbor bins

The domain has become extremely large so that neighbor bins cannot be used. Too many neighbor bins would need to be created to fill space. Most likely, one or more atoms have been blown a great distance out of the simulation box or a fix (like fix deform or a barostat) has excessively grown the simulation box.

5.2.19 Step X: (h)bondchk failed

This error is a consequence of the heuristic memory allocations for buffers of the regular ReaxFF version. In ReaxFF simulations, the lists of bonds and hydrogen bonds can change due to chemical reactions. The default approach, however, assumes that these changes are not very large, so it allocates buffers for the current system setup plus a safety margin. This can be adjusted with the *safezone*, *mincap*, and *minhbonds settings of the pair style*, but only to some extent. When equilibrating a new system, or simulating a sparse system in parallel, this can be difficult to control and become wasteful. A simple workaround is often to break a simulation down in multiple chunks. A better approach, however, is to compile and use the KOKKOS package version of ReaxFF (you do not need a GPU for that, but can also compile it in serial or OpenMP mode), which uses a more robust memory allocation approach.

5.2.20 Numeric index X is out of bounds

This error most commonly happens when setting force field coefficients with either the *pair_coeff*, the *bond_coeff*, the *angle_coeff*, the *dihedral_coeff*, or the *improper_coeff* command. These commands accept type labels, explicit numbers, and wildcards for ranges of numbers. If the numeric value of any of these is outside the valid range (defined by the number of corresponding types), LAMMPS will stop with this error. A few other commands and styles also allow ranges of numbers and check using the same method and thus print the same kind of error.

The cause is almost always a typo in the input or a logic error when defining the values or ranges. So one needs to carefully review the input. Along with the error, LAMMPS will print the valid range as a hint.

5.2.21 Compute, fix, or variable vector or array is accessed out-of-range

When accessing an individual element of a global vector or array or a per-atom vector or array provided by a compute or fix or atom-style or vector-style variable or data from a specific atom, an index in square brackets ("[" "]") (or two indices) must be provided to determine which element to access and it must be in a valid range or else LAMMPS would access invalid data or crash with a segmentation fault. In the two most common cases, where this data is accessed, *variable expressions* and *thermodynamic output*, LAMMPS will check for valid indices and stop with an error otherwise.

While LAMMPS is written in C++ (which uses 0 based indexing) these indices start at 1 (i.e. similar to Fortran). Any index smaller than 1 or larger than the maximum allowed value should trigger this error. Since this kind of error frequently happens with rather complex expressions, it is recommended to test these with small test systems, where the values can be tracked with output files for all relevant properties at every step.

5.2.22 Incorrect args for pair coefficients (also bond/angle/dihedral/improper coefficients)

The parameters in the *pair_coeff* command for a specified *pair_style* have a missing or erroneous argument. The same applies when seeing this error for *bond_coeff*, *angle_coeff*, *dihedral_coeff*, or *improper_coeff* and their respective style commands when using the MOLECULE or EXTRA-MOLECULE packages. The cases below describe some ways to approach pair coefficient errors, but the same strategies apply to bonded systems as well.

Outside of normal typos, this error can have several sources. In all cases, the first step is to compare the command arguments to the expected format found in the corresponding *pair_style* page. This can reveal cases where, for example, a pair style was changed, but the pair coefficients were not updated. This can happen especially with pair style variants such as *pair_style eam* vs. *pair_style eam/alloy* that look very similar but accept different parameters (the latter 'eam/alloy' variant takes element type names while 'eam' does not).

Another common source of coefficient errors is when using multiple pair styles with commands such as *pair_style hybrid*. Using hybrid pair styles requires adding an extra "label" argument in the coefficient commands that designates which pair style the command line refers to. Moreover, if the same pair style is used multiple times, this label must be followed by an additional numeric argument. Also, different pair styles may require different arguments.

This error message might also require a close look at other LAMMPS input files that are read in by the input script, such as data files or restart files.

5.2.23 Energy was not tallied on needed timestep (also virial, per-atom energy, per-atom virial)

This error is generated when LAMMPS attempts to access an out-of-date or non-existent energy, pressure, or virial. For efficiency reasons, LAMMPS does *not* calculate these quantities when the forces are calculated on every timestep or iteration. Global quantities are only calculated when they are needed for *thermo* output (at the beginning, end, and at regular intervals specified by the *thermo* command). Similarly, per-atom quantities are only calculated if they are needed to write per-atom energy or virial to a dump file. This system works fine for simple input scripts. However, the many user-specified *variable*, *fix*, and *compute* commands that LAMMPS provides make it difficult to anticipate when a quantity will be requested. In some use cases, LAMMPS will figure out that a quantity is needed and arrange for it to be calculated on that timestep e.g. if it is requested by *fix ave/time* or similar commands. If that fails, it can be detected by a mismatch between the current timestep and when a quantity was last calculated, in which case an error message of this type is generated.

The most common cause of this type of error is requesting a quantity before the start of the simulation.

```
# run 0 post no           # this will fix the error
variable e equal pe       # requesting energy compute
print "Potential energy = $e" # this will generate the error
run 1000                  # start of simulation
```

This situation can be avoided by adding in a “run 0” command, as explained in more detail in the “Variable Accuracy” section of the *variable* doc page.

Another cause is requesting a quantity on a timestep that is not a thermo or dump output timestep. This can often be remedied by increasing the frequency of thermo or dump output.

5.2.24 Molecule auto special bond generation overflow

In order to correctly apply the *special_bonds* settings (also known as “exclusions”), LAMMPS needs to maintain for each atom a list of atoms that are connected to this atom, either directly with a bond or indirectly through bonding with an intermediate atom(s). The purpose is to either remove or tag those pairs of atoms in the neighbor list. This information is stored with individual atoms and thus the maximum number of such “special” neighbors is set when the simulation box is created. When reading (relative) geometry and topology of a ‘molecule’ from a *molecule file*, LAMMPS will build the list of such “special” neighbors for the molecule atom (if not given in the molecule file explicitly). The error is triggered when the resulting list is too long for the space reserved when creating the simulation box. The solution is to increase the corresponding setting. Overestimating this value will only consume more memory, and is thus a safe choice.

5.2.25 Molecule topology/atom exceeds system topology/atom

LAMMPS uses *domain decomposition* to distribute data (i.e. atoms) across the MPI processes in parallel runs. This includes topology data about bonds, angles, dihedrals, impropers and “*special*” neighbors. This information is stored with either one or all atoms involved in such a topology entry (which of the two option applies depends on the *newton* setting for bonds). When reading a data file, LAMMPS analyzes the requirements for this file and then the values are “locked in” and cannot be extended.

So loading a molecule file that requires more of the topology per atom storage or adding a data file with such needs will lead to an error. To avoid the error, one or more of the *extra/XXX/per/atom* keywords are required to extend the corresponding storage. It is no problem to choose those numbers generously and have more storage reserved than actually needed, but having these numbers set too small will lead to an error.

5.2.26 Molecule topology type exceeds system topology type

The total number of atom, bond, angle, dihedral, and improper types is “locked in” when LAMMPS creates the simulation box. This can happen through either the *create_box*, the *read_data*, or the *read_restart* command. After this it is not possible to refer to an additional type. So loading a molecule file that uses additional types or adding a data file that would require additional types will lead to an error. To avoid the error, one or more of the *extra/XXX/types* keywords are required to extend the maximum number of the individual types.

5.2.27 Molecule attributes do not match system attributes

Choosing an *atom_style* in LAMMPS determines which per-atom properties are available. In a *molecule file*, however, it is possible to add sections (for example Masses or Charges) that are not supported by the atom style. Masses for example, are usually not a per-atom property, but defined through the atom type. Thus it would not be required to have a Masses section and the included data would be ignored. LAMMPS prints this warning to inform about this case.

5.2.28 Inconsistent image flags

This warning happens when the distance between the *unwrapped* x-, y-, or z-components of the coordinates of a bond is larger than half the box with periodic boundaries or larger than the box with non-periodic boundaries. It means that the positions and image flags have become inconsistent. LAMMPS will still compute bonded interactions based on the closest periodic images of the atoms and thus in most cases the results will be correct. However they can cause problems when such atoms are used with the *fix rigid* or *replicate* commands. Thus, it is good practice to update the system so that the message does not appear. It will help with future manipulations of the system.

There is one case where this warning *must* appear: when you have a chain of connected bonds that pass through the entire box and connect back to the first atom in the chain through periodic boundaries, i.e. some kind of “infinite polymer”. In that case, the bond image flags *must* be inconsistent for the one bond that reaches back to the beginning of the chain.

5.2.29 No fixes with time integration, atoms won’t move

This warning will be issued if LAMMPS encounters a *run* command that does not have a preceding *fix* command that updates atom/object positions and velocities per step. In other words, there are no fixes detected that perform velocity-Verlet time integration, such as *fix nve*. Note that this alert does not mean that there are no active fixes. LAMMPS has a very wide variety of fixes, many of which do not move objects but also operate through steps, such as printing outputs (e.g. *fix print*), performing calculations (e.g. *fix ave/time*), or changing other system parameters (e.g. *fix dt/reset*). It is up to the user to determine whether the lack of a time-integrating fix is intentional or not.

5.2.30 System is not charge neutral, net charge = ...

The sum of charges in the system is not zero. When a system is not charge-neutral, methods that evolve/manipulate per-atom charges, evaluate Coulomb interactions, evaluate Coulomb forces, or evaluate/manipulate other properties relying on per-atom charges may raise this warning. A non-zero net charge most commonly arises after setting per-atom charges *set* such that the sum is non-zero or by reading in a system through *read_data* where the per-atom charges do not sum to zero. However, a loss of charge neutrality may occur in other less common ways, like when charge equilibration methods (e.g., *fix qeq*) fail.

A similar warning/error may be raised when using certain charge equilibration methods: *fix qeq*, *fix qeq/comb*, *fix qeq/reaxff*, and *fix qtpie/reaxff*. In such cases, this warning/error will be raised for the *fix group* when the group has a non-zero net charge.

When the system is expected to be charge-neutral, this warning often arises due to an error in the lammps input (e.g., an incorrect *set* command, error in the data file read by *read_data*, incorrectly grouping atoms with charge, etc.). If the system is NOT expected to be charge-neutral, the user should make sure that the method(s) used are appropriate for systems with a non-zero net charge. Some commonly used fixes for charge equilibration *fix qeq*, pair styles that include charge interactions *pair_style coul/XXX*, and kspace methods *kspace_style* can, in theory, support systems with non-zero net charge. However, non-zero net charge can lead to spurious artifacts. The severity of these artifacts depends on the magnitude of total charge, system size, and methods used. Before running simulations or calculations for systems with non-zero net charge, users should test for artifacts and convergence of properties.

5.2.31 Variable evaluation before simulation box is defined

This error happens, when trying to expand or use an equal- or atom-style variable (or an equivalent style), where the expression contains a reference to something (e.g. a compute reference, a property of an atom, or a thermo keyword) that is not allowed to be used before the simulation box is defined. See the paragraph on *errors before or after the simulation box is created* for additional information.

5.2.32 Invalid thermo keyword ‘X’ in variable formula

This error message is often misleading. It is caused when evaluating a *variable command* expression and LAMMPS comes across a string that it does not recognize. LAMMPS first checks if a string is a reference to a compute, fix, custom property, or another variable by looking at the first 2-3 characters (and if it is, it checks whether the referenced item exists). Next LAMMPS checks if the string matches one of the available functions or constants. If that fails, LAMMPS will assume that this string is a *thermo keyword* and let the code for printing thermodynamic output return the corresponding value. However, if this fails too, since the string is not a thermo keyword, LAMMPS stops with the ‘Invalid thermo keyword’ error. But it is also possible, that there is just a typo in the name of a valid variable function. Thus it is recommended to check the failing variable expression very carefully.

5.2.33 One or more atoms are time integrated more than once

This is probably an error since you typically do not want to advance the positions or velocities of an atom more than once per timestep. This typically happens when there are multiple fix commands that advance atom positions with overlapping groups. Also, for some fix styles it is not immediately obvious that they include time integration. Please check the documentation carefully.

5.2.34 XXX command before simulation box is defined

This error occurs when trying to execute a LAMMPS command that requires information about the system dimensions, or the number atom, bond, angle, dihedral, or improper types, or the number of atoms or similar data that is only available *after* the simulation box has been created. See the paragraph on *errors before or after the simulation box is created* for additional information.

5.2.35 XXX command after simulation box is defined

This error occurs when trying to execute a LAMMPS command that changes a global setting *after* it is locked in when the simulation box is created (for instance defining the *atom style*, *dimension*, *newton*, or *units* setting). These settings may only be changed *before* the simulation box has been created. See the paragraph on *errors before or after the simulation box is created* for additional information.

5.2.36 Error messages ending in ‘Please contact the LAMMPS developers’

Such error messages indicate that something unexpected has happened and that it will require a good understanding of the details of the design of LAMMPS to resolve this. This can be due to some bug in contributed code, an oversight when updating functionality, a feature that is scheduled to be removed or reaching a combination of flags and settings that should not be possible or similar.

Even if you find a way to work around this error or warning, you should contact the LAMMPS developers and prepare a minimal set of inputs that can be used to reproduce this error or warning. By providing the input, the LAMMPS developers can then assess whether additional action is needed and who else to contact about this, if needed.

There are multiple ways to get into contact and report your issue. In order of preference there are:

- Submit a bug report [issue in the LAMMPS GitHub repository](#)
- Post a message in the “LAMMPS Development” forum in the [MatSci Community Discourse](#)
- Send an email to developers@lammmps.org
- Send an email to an *individual LAMMPS developer* that you know and trust

5.2.37 Neighbor list overflow, boost neigh_modify one

The neighbor list code in LAMMPS uses a special memory allocation strategy to speed up building and accessing neighbor lists.

Instead of making a memory allocation for each list of neighbors of the atoms LAMMPS allocates “pages” that have room for several neighbor lists. This has two main advantages:

1. It is not needed to first count how many neighbors there are for an atom to determine the storage required. Since the pages are much larger than individual lists, LAMMPS just “fills up” the page until there is not enough space left and then allocates a new page.
2. There are fewer calls to the memory allocator functions (which can be time consuming for long-running jobs and fragmented memory space) and the resulting neighbor lists are close to each other physically which improves cache efficiency.

This is controlled by the two parameters “one” and “page”, respectively, that can be set via the *neigh_modify command*. The parameter “one” is the maximum number of entries in a list of neighbors for a single atom. If an atom has more

neighbors as the “one” parameter allows, the “overflow” error message is triggered. The parameter “page” sets the size of the page. The neighbor list code checks, if there are “one” entries left in the current page. If not, a new page is allocated.

The default settings are suitable for most systems. They need to be changed, for instance, when simulating a system with a very high density or when setting a very long cutoff (e.g. $\gtrsim 15\text{\AA}$ with *units real*). The value of “page” **must** be at least 10x the value of “one”, but 50x to 100x are recommended to avoid wasting memory. The neighbor list storage is typically the largest amount of RAM required by a LAMMPS calculation.

Even though the LAMMPS error message recommends to increase the “one” parameter, this may not always be the correct solution. The neighbor list overflow can also be a symptom for some other error that cannot be easily detected. For example, a frequent reason for an (unexpected) high density are incorrect box dimensions (since LAMMPS wraps atoms back into the principal box with periodic boundaries) or coordinates provided as fractional coordinates (LAMMPS does not support this for data files). In both cases, LAMMPS cannot easily know whether the input geometry has such a high density (and thus requiring more neighbor list storage per atom) on purpose or by accident. Rather than blindly increasing the “one” parameter, it is thus worth checking if this is justified by the combination of density and cutoff. This is particularly recommended when using some tool(s) to convert input or data files.

When boosting (= increasing) the “one” parameter, it is recommended to also increase the value for the “page” parameter to maintain the ratio between “one” and “page” to reduce waste of memory. For some more details, please check out the documentation for the *neigh_modify command*.

5.2.38 Variable ... : Compute/Fix ... does not compute requested property

Compute and fix styles can compute different kinds of properties: for example, global scalars, vectors, or arrays, or per-atom vectors or arrays. In equal-style or similar variable, only scalar properties can be used, so to access a particular element in a vector one has to use square brackets with a suitable index to select it. However, not all fixes and computes provide all types of properties. So this error message will be shown if there is a mismatch, or if there are not enough or too many square brackets. To differentiate between accessing an element of a global array or a per-atom array element of a specific atom, one has to use a reference with a lower case ‘c’ (e.g. ‘c_name’) for the former and upper case ‘C’ (e.g. ‘C_name’) for the latter. The same applies to fix styles. The full details are in the documentation for the *variable command*.

5.2.39 The ... style ... is no longer available

While the LAMMPS developers try to keep the software backward compatible as far as input files and file formats are concerned, this is not always desired and changes are made and commands renamed or removed. In that case an error message is printed describing why the command cannot be executed. More details can be found on the manual page *Removed commands and packages*.

5.3 Reporting bugs

If you are confident that you have found a bug in LAMMPS, please follow the steps outlined below:

- Check the [New features and bug fixes](#) section of the [LAMMPS WWW site](#) or the [GitHub Releases page](#) to see if the bug has already been addressed in a patch release.
- Check that your issue can be reproduced with the latest development version of LAMMPS.
- Check the manual carefully to verify that the unexpected behavior you are observing is indeed in conflict with the documentation
- Check the [GitHub Issue page](#) if your issue has already been reported and if it is still open.
- Check the [GitHub Pull Requests page](#) to see if there is already a fix for your bug pending.
- Check the [LAMMPS forum at MatSci](#) to see if the issue has been discussed before.

If none of these steps yields any useful information, please file a new bug report on the [GitHub Issue page](#). The website will offer you to select a suitable template with explanations and then you should replace those explanations with the information that you can provide to reproduce your issue.

The most useful thing you can do to help us verify and fix a bug is to isolate the problem. Run it on the smallest number of atoms and fewest number of processors with the simplest input script that reproduces the bug. Try to identify what command or combination of commands is causing the problem and upload the complete input deck as a tar or zip archive. Please avoid using binary restart files unless the issue requires it. In the latter case you should also include an input deck to quickly generate this restart from a data file or a simple additional input. This input deck can be used with tools like a debugger or [valgrind](#) to further *debug the crash*.

You may also post a message in the [development category](#) of the LAMMPS forum at [MatSci](#) describing the problem with the same kind of information. The forum can provide a faster response, especially if the bug reported is actually expected behavior or other LAMMPS users have come across it before.

5.4 Debugging crashes

If LAMMPS crashes with a “segmentation fault” or a “bus error” or similar message, then you can use the following two methods to further narrow down the origin of the issue. This will help the LAMMPS developers (or yourself) to understand the reason for the crash and apply a fix (either to the input script or the source code). This requires that your LAMMPS executable includes the required [debug information](#). Otherwise it is not possible to look up the names of functions or variables.

The following patch will introduce a bug into the code for pair style [lj/cut](#) when using the `examples/melt/in.melt` input. We use it to show how to identify the origin of a segmentation fault.

```
--- a/src/pair_lj_cut.cpp
+++ b/src/pair_lj_cut.cpp
@@ -81,6 +81,7 @@ void PairLJCut::compute(int eflag, int vflag)
    int nlocal = atom->nlocal;

Segmentation fault (core dumped)

```

5.4.1 Using the GDB debugger to get a stack trace

There are two options to use the GDB debugger for identifying the origin of the segmentation fault or similar crash. The GDB debugger has many more features and options, as can be seen for example its [online documentation](#).

Run LAMMPS from within the debugger

Running LAMMPS under the control of the debugger as shown below only works for a single MPI rank (for debugging a program running in parallel you usually need a parallel debugger program). A simple way to launch GDB is to prefix the LAMMPS command-line with `gdb --args` and then type the command “run” at the GDB prompt. This will launch the debugger, load the LAMMPS executable and its debug info, and then run it. When it reaches the code causing the segmentation fault, it will stop with a message why it stopped, print the current line of code, and drop back to the GDB prompt.

```

(gdb) run
[...]
Setting up Verlet run ...
  Unit style      : lj
  Current step    : 0
  Time step       : 0.005

Program received signal SIGSEGV, Segmentation fault.
0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag=
→ <optimized out>) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
139      comx += atom->rmas[i]*x[i][0]; /* BUG */
(gdb)

```

Now typing the command “where” will show the stack of functions starting from the current function back to “main()”.

```
(gdb) where
#0  0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag=
→<optimized out>) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
#1  0x00000000004cf0a2 in LAMMPS_NS::Verlet::setup (this=0x7e6c90, flag=1) at /home/
→akohlmey/compile/lammps/src/verlet.cpp:131
#2  0x000000000049db42 in LAMMPS_NS::Run::command (this=this@entry=0x7fffffffcca0,
→narg=narg@entry=1, arg=arg@entry=0x7e8750)
    at /home/akohlmey/compile/lammps/src/run.cpp:177
#3  0x000000000041258a in LAMMPS_NS::Input::command_creator<LAMMPS_NS::Run> (lmp=
→<optimized out>, narg=1, arg=0x7e8750)
    at /home/akohlmey/compile/lammps/src/input.cpp:878
#4  0x0000000000410ad3 in LAMMPS_NS::Input::execute_command (this=0x7d1410) at /home/
→akohlmey/compile/lammps/src/input.cpp:864
#5  0x00000000004111fb in LAMMPS_NS::Input::file (this=0x7d1410) at /home/akohlmey/
→compile/lammps/src/input.cpp:229
#6  0x000000000040933a in main (argc=<optimized out>, argv=<optimized out>) at /home/
→akohlmey/compile/lammps/src/main.cpp:65
(gdb)
```

You can also print the value of variables and see if there is anything unexpected. Segmentation faults, for example, commonly happen when a pointer variable is not assigned and still initialized to NULL.

```
(gdb) print x
$1 = (double **) 0x7ffff7ca1010
(gdb) print i
$2 = 0
(gdb) print x[0]
$3 = (double *) 0x7ffff6d80010
(gdb) print x[0][0]
$4 = 0
(gdb) print x[1][0]
$5 = 0.83979809569125363
(gdb) print atom->rmass
$6 = (double *) 0x0
(gdb)
```

Inspect a core dump file with the debugger

When an executable crashes with a “core dumped” message, it creates a file “core” or “core.<PID#>” which contains the information about the current state. This file may be located in the folder where you ran LAMMPS or in some hidden folder managed by the systemd daemon. In the latter case, you need to “extract” the core file with the `coredumpctl` utility to the current folder. Example: `coredumpctl -o core dump lmp`. Now you can launch the debugger to load the executable, its debug info and the core dump and drop you to a prompt like before.

```
$ gdb lmp core
Reading symbols from lmp...
[New LWP 1928535]
[Thread debugging using libthread_db enabled]
Using host libthread_db library "/lib64/libthread_db.so.1".
Core was generated by `./lmp -in in.melt'.
Program terminated with signal SIGSEGV, Segmentation fault.
#0  0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x1b10740, eflag=1, vflag=
→<optimized out>)
```

(continues on next page)

(continued from previous page)

```

    at /home/akohlmeier/compile/lammps/src/pair_lj_cut.cpp:139
139      comx += atom->rmass[i]*x[i][0]; /* BUG */
(gdb)

```

From here on, you use the same commands as shown before to get a stack trace and print current values of (pointer) variables.

5.4.2 Using valgrind to get a stack trace

The `valgrind` suite of tools allows to closely inspect the behavior of a compiled program by essentially emulating a CPU and instrumenting the program while running. This slows down execution quite significantly, but can also report issues that are not resulting in a crash. The default `valgrind` tool is a memory checker and you can use it by prefixing the normal command-line with `valgrind`. Unlike GDB, this will also work for parallel execution, but it is recommended to redirect the `valgrind` output to a file (e.g. with `--log-file=crash-%p.txt`, the `%p` will be substituted with the process ID) so that the messages of the multiple `valgrind` instances to the console are not mixed.

```

$ valgrind ./lmp -in in.melt

```

As you can see, the stack trace information is similar to that obtained from GDB. In addition you get a more specific hint about what cause the segmentation fault, i.e. that it is a NULL pointer dereference. To find out which pointer exactly was NULL, you need to use the debugger, though.

5.5 Debugging when LAMMPS appears to be stuck

Sometimes the LAMMPS calculation appears to be stuck, that is the LAMMPS process or processes are active, but there is no visible progress. This can have multiple reasons:

- The selected styles are slow and require a lot of CPU time and the system is large. When extrapolating the expected speed from smaller systems, one has to factor in that not all models scale linearly with system size, e.g. *k-space styles like ewald or pppm*. There is very little that can be done in this case.
- The output interval is not set or set to a large value with the *thermo* command. In the first case, there will be output only at the first and last step.
- The output is block-buffered and instead of line-buffered. The output will only be written to the screen after 4096 or 8192 characters of output have accumulated. This most often happens for files but also with MPI parallel executables for output to the screen, since the output to the screen is handled by the MPI library so that output from all processes can be shown. This can be suppressed by using the *-nonblock* or *-nb* command-line flag, which turns off buffering for screen and logfile output.
- An MPI parallel calculation has a bug where a collective MPI function is called (e.g. *MPI_Barrier()*, *MPI_Bcast()*, *MPI_Allreduce()* and so on) before pending point-to-point communications are completed or when the collective function is only called from a subset of the MPI processes. This also applies to some internal LAMMPS functions like *Error::all()* which uses *MPI_Barrier()* and thus *Error::one()* must be called, if the error condition does not happen on all MPI processes simultaneously.
- Some function in LAMMPS has a bug where a *for* or *while* loop does not trigger the exit condition and thus will loop forever. This can happen when the wrong variable is incremented or when one value in a comparison becomes NaN due to an overflow.

In the latter two cases, further information and stack traces (see above) can be obtained by attaching a debugger to a running process. For that the process ID (PID) is needed; this can be found on Linux machines with the *top*, *htop*, *ps*, or *pstree* commands.

Then running the (GNU) debugger *gdb* with the *-p* flag followed by the process id will attach the process to the debugger and stop execution of that specific process. From there on it is possible to issue all debugger commands in the same way as when LAMMPS was started from the debugger (see above). Most importantly it is possible to obtain a stack trace with the *where* command and thus determine where in the execution of a timestep this process is. Also internal data can be printed and execution single stepped or continued. When the debugger is exited, the calculation will resume normally.

5.6 Error messages

This is an alphabetic list of some of the ERROR messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. This is a historic list and no longer updated. Instead the LAMMPS developers are trying to provide more details right with the error message or link to a paragraph with *detailed explanations*.

Error messages also list the source file and line number where the error was generated. For example, a message like this:

`ERROR: Illegal velocity command (velocity.cpp:78)`

means that line #78 in the file `src/velocity.cpp` generated the error. Looking in the source code may help you figure out what went wrong.

Please also see the page with [Warning messages](#).

Accelerator sharing is not currently supported on system

Multiple MPI processes cannot share the accelerator on your system. For NVIDIA GPUs, see the `nvidia-smi` command to change this setting.

All angle coeffs are not set

All angle coefficients must be set in the data file or by the `angle_coeff` command before running a simulation.

All bond coeffs are not set

All bond coefficients must be set in the data file or by the `bond_coeff` command before running a simulation.

All dihedral coeffs are not set

All dihedral coefficients must be set in the data file or by the `dihedral_coeff` command before running a simulation.

All improper coeffs are not set

All improper coefficients must be set in the data file or by the `improper_coeff` command before running a simulation.

All masses are not set

For atom styles that define masses for each atom type, all masses must be set in the data file or by the `mass` command before running a simulation. They must also be set before using the `velocity` command.

All mol IDs should be set for fix gcmc group atoms

The molecule flag is on, yet not all molecule ids in the fix group have been set to non-zero positive values by the user. This is an error since all atoms in the fix gcmc group are eligible for deletion, rotation, and translation and therefore must have valid molecule ids.

All pair coeffs are not set

All pair coefficients must be set in the data file or by the `pair_coeff` command before running a simulation.

All read_dump x,y,z fields must be specified for scaled, triclinic coords

For triclinic boxes and scaled coordinates you must specify all 3 of the x,y,z fields, else LAMMPS cannot reconstruct the unscaled coordinates.

Angle atom missing in delete_bonds

The `delete_bonds` command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

Angle atom missing in set command

The `set` command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

Angle coeff for hybrid has invalid style

Angle style hybrid uses another angle style as one of its coefficients. The angle style used in the `angle_coeff` command or read from a restart file is not recognized.

Angle coeffs are not set

No angle coefficients have been assigned in the data file or via the `angle_coeff` command.

Angle extent > half of periodic box length

This error was detected by the neigh_modify check yes setting. It is an error because the angle atoms are so far apart it is ambiguous how it should be defined.

Angle potential must be defined for SHAKE

When shaking angles, an angle_style potential must be used.

Angle table parameters did not set N

List of angle table parameters must include N setting.

Angle_coeff command before angle_style is defined

Coefficients cannot be set in the data file or via the angle_coeff command until an angle_style has been assigned.

Angle_coeff command before simulation box is defined

The angle_coeff command cannot be used before a read_data, read_restart, or create_box command.

Angle_coeff command when no angles allowed

The chosen atom style does not allow for angles to be defined.

Angle_style command when no angles allowed

The chosen atom style does not allow for angles to be defined.

Angles assigned incorrectly

Angles read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Angles defined but no angle types

The data file header lists angles but no angle types.

Append boundary must be shrink/minimum

The boundary style of the face where atoms are added must be of type m (shrink/minimum).

Arccos of invalid value in variable formula

Argument of arccos() must be between -1 and 1.

Arcsin of invalid value in variable formula

Argument of arcsin() must be between -1 and 1.

Atom IDs must be used for molecular systems

Atom IDs are used to identify and find partner atoms in bonds.

Atom count changed in fix neb

This is not allowed in a NEB calculation.

Atom count is inconsistent, cannot write data file

The sum of atoms across processors does not equal the global number of atoms. Probably some atoms have been lost.

Atom count is inconsistent, cannot write restart file

Sum of atoms across processors does not equal initial total count. This is probably because you have lost some atoms.

Atom sort did not operate correctly

This is an internal LAMMPS error. Please report it to the developers.

Atom style template molecule must have atom types

The defined molecule(s) does not specify atom types.

Atom style was redefined after using fix property/atom

This is not allowed.

Atom vector in equal-style variable formula

Atom vectors generate one value per atom which is not allowed in an equal-style variable.

Atom-style variable in equal-style variable formula

Atom-style variables generate one value per atom which is not allowed in an equal-style variable.

Atom_modify id command after simulation box is defined

The atom_modify id command cannot be used after a read_data, read_restart, or create_box command.

Atom_modify map command after simulation box is defined

The atom_modify map command cannot be used after a read_data, read_restart, or create_box command.

Atom_style command after simulation box is defined

The atom_style command cannot be used after a read_data, read_restart, or create_box command.

Atomfile variable could not read values

Check the file assigned to the variable.

Attempt to pop empty stack in fix box/relax

Internal LAMMPS error. Please report it to the developers.

Attempt to push beyond stack limit in fix box/relax

Internal LAMMPS error. Please report it to the developers.

Attempting to rescale a 0.0 temperature

Cannot rescale a temperature that is already 0.0.

Bad FENE bond

Two atoms in a FENE bond have become so far apart that the bond cannot be computed.

Bad TIP4P angle type for PPPM/TIP4P

Specified angle type is not valid.

Bad TIP4P angle type for PPPMDisp/TIP4P

Specified angle type is not valid.

Bad TIP4P bond type for PPPM/TIP4P

Specified bond type is not valid.

Bad TIP4P bond type for PPPMDisp/TIP4P

Specified bond type is not valid.

Bad fix ID in fix append/atoms command

The value of the fix_id for keyword spatial must start with “f_”.

Bad grid of processors

The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

Bad kspace_modify kmax/ewald parameter

Kspace_modify values for the kmax/ewald keyword must be integers > 0

Bad kspace_modify slab parameter

Kspace_modify value for the slab/volume keyword must be >= 2.0.

Bad matrix inversion in mldivide3

This error should not occur unless the matrix is badly formed.

Bad principal moments

Fix rigid did not compute the principal moments of inertia of a rigid group of atoms correctly.

Bad quadratic solve for particle/line collision

This is an internal error. It should normally not occur.

Bad quadratic solve for particle/tri collision

This is an internal error. It should normally not occur.

Bad real space Coulombic cutoff in fix tune/kspace

Fix tune/kspace tried to find the optimal real space Coulombic cutoff using the Newton-Raphson method, but found a non-positive or NaN cutoff

Balance command before simulation box is defined

The balance command cannot be used before a read_data, read_restart, or create_box command.

Balance produced bad splits

This should not occur. It means two or more cutting plane locations are on top of each other or out of order. Report the problem to the developers.

Balance rcb cannot be used with comm_style brick

Comm_style tiled must be used instead.

Balance shift string is invalid

The string can only contain the characters “x”, “y”, or “z”.

Bias compute does not calculate a velocity bias

The specified compute must compute a bias for temperature.

Bias compute does not calculate temperature

The specified compute must compute temperature.

Bias compute group does not match compute group

The specified compute must operate on the same group as the parent compute.

Big particle in fix srd cannot be point particle

Big particles must be extended spheroids or ellipsoids.

Bigint setting in lmptype.h is invalid

Size of bigint is less than size of tagint.

Bigint setting in lmptype.h is not compatible

Format of bigint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Bitmapped lookup tables require int/float be same size

Cannot use pair tables on this machine, because of word sizes. Use the pair_modify command with table 0 instead.

Bitmapped table in file does not match requested table

Setting for bitmapped table in pair_coeff command must match table in file exactly.

Bitmapped table is incorrect length in table file

Number of table entries is not a correct power of 2.

Bond and angle potentials must be defined for TIP4P

Cannot use TIP4P pair potential unless bond and angle potentials are defined.

Bond atom missing in box size check

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in delete_bonds

The delete_bonds command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

Bond atom missing in set command

The set command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

Bond coeff for hybrid has invalid style

Bond style hybrid uses another bond style as one of its coefficients. The bond style used in the bond_coeff command or read from a restart file is not recognized.

Bond coeffs are not set

No bond coefficients have been assigned in the data file or via the bond_coeff command.

Bond extent > half of periodic box length

This error was detected by the neigh_modify check yes setting. It is an error because the bond atoms are so far apart it is ambiguous how it should be defined.

Bond potential must be defined for SHAKE

Cannot use fix shake unless bond potential is defined.

Bond style quartic cannot be used with 3,4-body interactions

No angle, dihedral, or improper styles can be defined when using bond style quartic.

Bond style quartic cannot be used with atom style template

This bond style can change the bond topology which is not allowed with this atom style.

Bond style quartic requires special_bonds = 1,1,1

This is a restriction of the current bond quartic implementation.

Bond table parameters did not set N

List of bond table parameters must include N setting.

Bond table values are not increasing

The values in the tabulated file must be monotonically increasing.

BondAngle coeff for hybrid angle has invalid format

No “ba” field should appear in data file entry.

BondBond coeff for hybrid angle has invalid format

No “bb” field should appear in data file entry.

Bond_coeff command before bond_style is defined

Coefficients cannot be set in the data file or via the bond_coeff command until an bond_style has been assigned.

Bond_coeff command before simulation box is defined

The bond_coeff command cannot be used before a read_data, read_restart, or create_box command.

Bond_coeff command when no bonds allowed

The chosen atom style does not allow for bonds to be defined.

Bond_style command when no bonds allowed

The chosen atom style does not allow for bonds to be defined.

Bonds assigned incorrectly

Bonds read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Bonds defined but no bond types

The data file header lists bonds but no bond types.

Both sides of boundary must be periodic

Cannot specify a boundary as periodic only on the lo or hi side. Must be periodic on both sides.

Boundary command after simulation box is defined

The boundary command cannot be used after a read_data, read_restart, or create_box command.

Box bounds are invalid

The box boundaries specified in the read_data file are invalid. The lo value must be less than the hi value for all 3 dimensions.

Box command after simulation box is defined

The box command cannot be used after a read_data, read_restart, or create_box command.

CPU neighbor lists must be used for ellipsoid/sphere mix.

When using Gay-Berne or RE-squared pair styles with both ellipsoidal and spherical particles, the neighbor list must be built on the CPU

Can not specify Pxy/Pxz/Pyz in fix box/relax with non-triclinic box

Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

Can not specify Pxy/Pxz/Pyz in fix nvt/npt/nph with non-triclinic box

Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

Cannot (yet) do analytic differentiation with pppm/gpu

This is a current restriction of this command.

Cannot (yet) request ghost atoms with Kokkos half neighbor list

This feature is not yet supported.

Cannot (yet) use 'electron' units with dipoles

This feature is not yet supported.

Cannot (yet) use Ewald with triclinic box and slab correction

This feature is not yet supported.

Cannot (yet) use K-space slab correction with compute group/group for triclinic systems

This option is not yet supported.

Cannot (yet) use MSM with 2d simulation

This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and TIP4P

This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and kspace_modify diff ad

This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and slab correction

This feature is not yet supported.

Cannot (yet) use kspace slab correction with long-range dipoles and non-neutral systems or per-atom energy

This feature is not yet supported.

Cannot (yet) use kspace_modify diff ad with compute group/group

This option is not yet supported.

Cannot (yet) use kspace_style pppm/stagger with triclinic systems

This feature is not yet supported.

Cannot (yet) use single precision with MSM (remove -DFFT_SINGLE from Makefile and re-compile)

Single precision cannot be used with MSM.

Cannot add atoms to fix move variable

Atoms can not be added afterwards to this fix option.

Cannot append atoms to a triclinic box

The simulation box must be defined with edges aligned with the Cartesian axes.

Cannot change box ortho/triclinic with certain fixes defined

This is because those fixes store the shape of the box. You need to use unfix to discard the fix, change the box, then redefine a new fix.

Cannot change box ortho/triclinic with dumps defined

This is because some dumps store the shape of the box. You need to use undump to discard the dump, change the box, then redefine a new dump.

Cannot change box tilt factors for orthogonal box

Cannot use tilt factors unless the simulation box is non-orthogonal.

Cannot change dump_modify every for dump dcd

The frequency of writing dump dcd snapshots cannot be changed.

Cannot change dump_modify every for dump xtc

The frequency of writing dump xtc snapshots cannot be changed.

Cannot change timestep once fix srd is setup

This is because various SRD properties depend on the timestep size.

Cannot change timestep with fix pour

This is because fix pour pre-computes the time delay for particles to fall out of the insertion volume due to gravity.

Cannot change_box after reading restart file with per-atom info

This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

Cannot clear group all

This operation is not allowed.

Cannot compute initial g_ewald_disp

LAMMPS failed to compute an initial guess for the PPPM_disp g_ewald_6 factor that partitions the computation between real space and k-space for Dispersion interactions.

Cannot create an atom map unless atoms have IDs

The simulation requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.

Cannot create atoms with undefined lattice

Must use the lattice command before using the create_atoms command.

Cannot create/grow a vector/array of pointers for %s

LAMMPS code is making an illegal call to the templated memory allocators, to create a vector or array of pointers.

Cannot create_atoms after reading restart file with per-atom info

The per-atom info was stored to be used when by a fix that you may re-define. If you add atoms before re-defining the fix, then there will not be a correct amount of per-atom info.

Cannot create_box after simulation box is defined

A simulation box can only be defined once.

Cannot currently use pair reax with pair hybrid

This is not yet supported.

Cannot displace_atoms after reading restart file with per-atom info

This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

Cannot do GCMC on atoms in atom_modify first group

This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot do atom/swap on atoms in atom_modify first group

This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot dump sort when multiple dump files are written

In this mode, each processor dumps its atoms to a file, so no sorting is allowed.

Cannot embed Python when also extending Python with LAMMPS

When running LAMMPS via Python through the LAMMPS library interface you cannot also use the input script python command.

Cannot evaporate atoms in atom_modify first group

This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot find delete_bonds group ID

Group ID used in the delete_bonds command does not exist.

Cannot have both pair_modify shift and tail set to yes

These 2 options are contradictory.

Cannot intersect groups using a dynamic group

This operation is not allowed.

Cannot open ADP potential file %s

The specified ADP potential file cannot be opened. Check that the path and name are correct.

Cannot open AIREBO potential file %s

The specified AIREBO potential file cannot be opened. Check that the path and name are correct.

Cannot open BOP potential file %s

The specified BOP potential file cannot be opened. Check that the path and name are correct.

Cannot open COMB potential file %s

The specified COMB potential file cannot be opened. Check that the path and name are correct.

Cannot open COMB3 lib.comb3 file

The COMB3 library file cannot be opened. Check that the path and name are correct.

Cannot open COMB3 potential file %s

The specified COMB3 potential file cannot be opened. Check that the path and name are correct.

Cannot open EAM potential file %s

The specified EAM potential file cannot be opened. Check that the path and name are correct.

Cannot open EIM potential file %s

The specified EIM potential file cannot be opened. Check that the path and name are correct.

Cannot open LCBOP potential file %s

The specified LCBOP potential file cannot be opened. Check that the path and name are correct.

Cannot open MEAM potential file %s

The specified MEAM potential file cannot be opened. Check that the path and name are correct.

Cannot open SNAP coefficient file %s

The specified SNAP coefficient file cannot be opened. Check that the path and name are correct.

Cannot open SNAP parameter file %s

The specified SNAP parameter file cannot be opened. Check that the path and name are correct.

Cannot open Stillinger-Weber potential file %s

The specified SW potential file cannot be opened. Check that the path and name are correct.

Cannot open Tersoff potential file %s

The specified potential file cannot be opened. Check that the path and name are correct.

Cannot open Vashishta potential file %s

The specified Vashishta potential file cannot be opened. Check that the path and name are correct.

Cannot open coul/streitz potential file %s

The specified coul/streitz potential file cannot be opened. Check that the path and name are correct.

Cannot open data file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open dir to search for restart file

Using a "*" in the name of the restart file will open the current directory to search for matching file names.

Cannot open dump file %s

The output file for the dump command cannot be opened. Check that the path and name are correct.

Cannot open file %s

The specified file cannot be opened. Check that the path and name are correct. If the file is a compressed file, also check that the gzip executable can be found and run.

Cannot open file variable file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/chunk file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/correlate file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/histo file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/time file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix print file %s

The output file generated by the fix print command cannot be opened

Cannot open fix qeq parameter file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix qeq/comb file %s

The output file for the fix qeq/combs command cannot be opened. Check that the path and name are correct.

Cannot open fix reax/bonds file %s

The output file for the fix reax/bonds command cannot be opened. Check that the path and name are correct.

Cannot open fix rigid infile %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix rigid restart file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix rigid/small infile %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix tmd file %s

The output file for the fix tmd command cannot be opened. Check that the path and name are correct.

Cannot open fix ttm file %s

The output file for the fix ttm command cannot be opened. Check that the path and name are correct.

Cannot open gzipped file

LAMMPS was compiled without support for reading and writing gzipped files through a pipeline to the gzip program with -DLAMMPS_GZIP.

Cannot open log.cite file

This file is created when you use some LAMMPS features, to indicate what paper you should cite on behalf of those who implemented the feature. Check that you have write privileges into the directory you are running in.

Cannot open log.lammps for writing

The default LAMMPS log file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open logfile

The LAMMPS log file named in a command-line argument cannot be opened. Check that the path and name are correct.

Cannot open logfile %s

The LAMMPS log file specified in the input script cannot be opened. Check that the path and name are correct.

Cannot open molecule file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open nb3b/harmonic potential file %s

The specified potential file cannot be opened. Check that the path and name are correct.

Cannot open pair_write file

The specified output file for pair energies and forces cannot be opened. Check that the path and name are correct.

Cannot open polymorphic potential file %s

The specified polymorphic potential file cannot be opened. Check that the path and name are correct.

Cannot open screen file

The screen file specified as a command-line argument cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open universe log file

For a multi-partition run, the master log file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open universe screen file

For a multi-partition run, the master screen file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot read_restart after simulation box is defined

The read_restart command cannot be used after a read_data, read_restart, or create_box command.

Cannot redefine variable as a different style

An equal-style variable can be re-defined but only if it was originally an equal-style variable.

Cannot replicate 2d simulation in z dimension

The replicate command cannot replicate a 2d simulation in the z dimension.

Cannot replicate with fixes that store atom quantities

Either fixes are defined that create and store atom-based vectors or a restart file was read which included atom-based vectors for fixes. The replicate command cannot duplicate that information for new atoms. You should use the replicate command before fixes are applied to the system.

Cannot reset timestep with a dynamic region defined

Dynamic regions (see the region command) have a time dependence. Thus you cannot change the timestep when one or more of these are defined.

Cannot reset timestep with a time-dependent fix defined

You cannot reset the timestep when a fix that keeps track of elapsed time is in place.

Cannot run 2d simulation with non-periodic Z dimension

Use the boundary command to make the z dimension periodic in order to run a 2d simulation.

Cannot set bond topology types for atom style template

The bond, angle, etc types cannot be changed for this atom style since they are static settings in the molecule template files.

Cannot set both respa pair and inner/middle/outer

In the rRESPA integrator, you must compute pairwise potentials either all together (pair), or in pieces (inner/middle/outer). You can't do both.

Cannot set mass for this atom style

This atom style does not support mass settings for each atom type. Instead they are defined on a per-atom basis in the data file.

Cannot set respa hybrid and any of pair/inner/middle/outer

In the rRESPA integrator, you must compute pairwise potentials either all together (pair), with different cutoff regions (inner/middle/outer), or per hybrid sub-style (hybrid). You cannot mix those.

Cannot set respa middle without inner/outer

In the rRESPA integrator, you must define both a inner and outer setting in order to use a middle setting.

Cannot set temperature for fix rigid/nph

The temp keyword cannot be specified.

Cannot set this attribute for this atom style

The attribute being set does not exist for the defined atom style.

Cannot subtract groups using a dynamic group

This operation is not allowed.

Cannot union groups using a dynamic group

This operation is not allowed.

Cannot use Ewald with 2d simulation

The kspace style ewald cannot be used in 2d simulations. You can use 2d Ewald in a 3d simulation; see the kspace_modify command.

Cannot use Ewald/disp solver on system with no charge, dipole, or LJ particles

No atoms in system have a non-zero charge or dipole, or are LJ particles. Change charges/dipoles or change options of the kspace solver/pair style.

Cannot use EwaldDisp with 2d simulation

This is a current restriction of this command.

Cannot use NEB unless atom map exists

Use the atom_modify command to create an atom map.

Cannot use NEB with atom_modify sort enabled

This is current restriction for NEB implemented in LAMMPS.

Cannot use PPPM with 2d simulation

The kspace style ppm cannot be used in 2d simulations. You can use 2d PPPM in a 3d simulation; see the kspace_modify command.

Cannot use PPPMDisp with 2d simulation

The kspace style ppm/disp cannot be used in 2d simulations. You can use 2d ppm/disp in a 3d simulation; see the kspace_modify command.

Cannot use PRD with a changing box

The current box dimensions are not copied between replicas

Cannot use PRD with a time-dependent fix defined

PRD alters the timestep in ways that will mess up these fixes.

Cannot use PRD with a time-dependent region defined

PRD alters the timestep in ways that will mess up these regions.

Cannot use PRD with atom_modify sort enabled

This is a current restriction of PRD. You must turn off sorting, which is enabled by default, via the atom_modify command.

Cannot use PRD with multi-processor replicas unless atom map exists

Use the atom_modify command to create an atom map.

Cannot use TAD unless atom map exists for NEB

See atom_modify map command to set this.

Cannot use TAD with a single replica for NEB

NEB requires multiple replicas.

Cannot use TAD with atom_modify sort enabled for NEB

This is a current restriction of NEB.

Cannot use a damped dynamics min style with fix box/relax

This is a current restriction in LAMMPS. Use another minimizer style.

Cannot use a damped dynamics min style with per-atom DOF

This is a current restriction in LAMMPS. Use another minimizer style.

Cannot use append/atoms in periodic dimension

The boundary style of the face where atoms are added can not be of type p (periodic).

Cannot use chosen neighbor list style with buck/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/cut/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/dsf/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/wolf/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/coul/cut/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/coul/long/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/spica/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with pair eam/kk

That style is not supported by Kokkos.

Cannot use compute cluster/atom unless atoms have IDs

Atom IDs are used to identify clusters.

Cannot use create_bonds unless atoms have IDs

This command requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.

Cannot use cwiggle in variable formula between runs

This is a function of elapsed time.

Cannot use delete_atoms bond yes with atom_style template

This is because the bonds for that atom style are hardwired in the molecule template.

Cannot use delete_atoms unless atoms have IDs

Your atoms do not have IDs, so the delete_atoms command cannot be used.

Cannot use delete_bonds with non-molecular system

Your choice of atom style does not have bonds.

Cannot use dynamic group with fix adapt atom

This is not yet supported.

Cannot use fix TMD unless atom map exists

Using this fix requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom_modify map command will force an atom map to be created.

Cannot use fix bond/break with non-molecular systems

Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix bond/create with non-molecular systems

Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix bond/swap with non-molecular systems

Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix box/relax on a 2nd non-periodic dimension

When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix box/relax on a non-periodic dimension

When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix box/relax with both relaxation and scaling on a tilt factor

When specifying scaling on a tilt factor component, that component can not also be controlled by the barostat. E.g. if scalexy yes is specified and also keyword tri or xy, this is wrong.

Cannot use fix box/relax with tilt factor scaling on a 2nd non-periodic dimension

When specifying scaling on a tilt factor component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix deform on a shrink-wrapped boundary

The x, y, z options cannot be applied to shrink-wrapped dimensions.

Cannot use fix deform tilt on a shrink-wrapped 2nd dim

This is because the shrink-wrapping will change the value of the strain implied by the tilt factor.

Cannot use fix deform trape on a box with zero tilt

The trape style alters the current strain.

Cannot use fix deposit rigid and shake

These two attributes are conflicting.

Cannot use fix gcmc in a 2d simulation

Fix gcmc is set up to run in 3d only. No 2d simulations with fix gcmc are allowed.

Cannot use fix npt and fix deform on same component of stress tensor

This would be changing the same box dimension twice.

Cannot use fix nvt/npt/nph on a 2nd non-periodic dimension

When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix nvt/npt/nph on a non-periodic dimension

When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix nvt/npt/nph with xy scaling when y is non-periodic dimension

The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix nvt/npt/nph with xz scaling when z is non-periodic dimension

The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix nvt/npt/nph with yz scaling when z is non-periodic dimension

The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix pour rigid and shake

These two attributes are conflicting.

Cannot use fix pour with triclinic box

This option is not yet supported.

Cannot use fix press/berendsen and fix deform on same component of stress tensor

These commands both change the box size/shape, so you cannot use both together.

Cannot use fix rigid npt/nph and fix deform on same component of stress tensor

This would be changing the same box dimension twice.

Cannot use fix rigid npt/nph on a non-periodic dimension

When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix rigid/small npt/nph on a non-periodic dimension

When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix shake with non-molecular system

Your choice of atom style does not have bonds.

Cannot use fix ttm with 2d simulation

This is a current restriction of this fix due to the grid it creates.

Cannot use fix ttm with triclinic box

This is a current restriction of this fix due to the grid it creates.

Cannot use fix tune/kSPACE without a pair style

This fix (tune/kSPACE) can only be used when a pair style has been specified.

Cannot use fix wall/srd more than once

Nor is there a need to since multiple walls can be specified in one command.

Cannot use lines with fix srd unless overlap is set

This is because line segments are connected to each other.

Cannot use neigh_modify exclude with GPU neighbor builds

This is a current limitation of the GPU implementation in LAMMPS.

Cannot use non-zero forces in an energy minimization

Fix setforce cannot be used in this manner. Use fix addforce instead.

Cannot use non-periodic boundaries with fix ttm

This fix requires a fully periodic simulation box.

Cannot use non-periodic boundaries with Ewald

For kspace style ewald, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with EwaldDisp

For kspace style ewald/disp, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with PPPM

For kspace style ppm, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with PPPMDisp

For kspace style ppm/disp, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use package gpu neigh yes with triclinic box

This is a current restriction in LAMMPS.

Cannot use pair tail corrections with 2d simulations

The correction factors are only currently defined for 3d systems.

Cannot use processors part command without using partitions

See the command-line -partition switch.

Cannot use ramp in variable formula between runs

This is because the ramp() function is time dependent.

Cannot use region INF or EDGE when box does not exist

Regions that extend to the box boundaries can only be used after the create_box command has been used.

Cannot use set atom with no atom IDs defined

Atom IDs are not defined, so they cannot be used to identify an atom.

Cannot use swiggle in variable formula between runs

This is a function of elapsed time.

Cannot use tris with fix srd unless overlap is set

This is because triangles are connected to each other.

Cannot use variable energy with constant force in fix addforce

This is because for constant force, LAMMPS can compute the change in energy directly.

Cannot use variable every setting for dump dcd

The format of DCD dump files requires snapshots be output at a constant frequency.

Cannot use variable every setting for dump xtc

The format of this file requires snapshots at regular intervals.

Cannot use vdisplace in variable formula between runs

This is a function of elapsed time.

Cannot use velocity create loop all unless atoms have IDs

Atoms in the simulation do not have IDs, so this style of velocity creation cannot be performed.

Cannot wiggle and shear fix wall/gran

Cannot specify both options at the same time.

Cannot yet use KSpace solver with grid with comm style tiled

This is current restriction in LAMMPS.

Cannot yet use compute tally with Kokkos

This feature is not yet supported.

Cannot yet use fix bond/break with this improper style

This is a current restriction in LAMMPS.

Cannot yet use fix bond/create with this improper style

This is a current restriction in LAMMPS.

Cannot zero Langevin force of 0 atoms

The group has zero atoms, so you cannot request its force be zeroed.

Cannot zero gld force for zero atoms

There are no atoms currently in the group.

Change_box volume used incorrectly

The “dim volume” option must be used immediately following one or two settings for “dim1 ...” (and optionally “dim2 ...”) and must be for a different dimension, i.e. $\text{dim} \neq \text{dim1}$ and $\text{dim} \neq \text{dim2}$.

Comm tiled invalid index in box drop brick

Internal error check in comm_style tiled which should not occur. Contact the developers.

Comm tiled mis-match in box drop brick

Internal error check in comm_style tiled which should not occur. Contact the developers.

Communication cutoff too small for SNAP micro load balancing

This can happen if you change the neighbor skin after your pair_style command or if your box dimensions grow during a run. You can set the cutoff explicitly via the comm_modify cutoff command.

Compute %s does not allow use of dynamic group

Dynamic groups have not yet been enabled for this compute.

Compute angle/local used when angles are not allowed

The atom style does not support angles.

Compute angmom/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute bond/local used when bonds are not allowed

The atom style does not support bonds.

Compute centro/atom requires a pair style be defined

This is because the computation of the centro-symmetry values uses a pairwise neighbor list.

Compute chunk/atom bin/cylinder radius is too large for periodic box

Radius cannot be bigger than 1/2 of a non-axis periodic dimension.

Compute chunk/atom bin/sphere radius is too large for periodic box

Radius cannot be bigger than 1/2 of any periodic dimension.

Compute chunk/atom ids once but nchunk is not once

You cannot assign chunks IDs to atom permanently if the number of chunks may change.

Compute chunk/atom stores no IDs for compute property/chunk

It will only store IDs if its compress option is enabled.

Compute chunk/atom stores no coord1 for compute property/chunk

Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom stores no coord2 for compute property/chunk

Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom stores no coord3 for compute property/chunk

Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom without bins cannot use discard mixed

That discard option only applies to the binning styles.

Compute cluster/atom cutoff is longer than pairwise cutoff

Cannot identify clusters beyond cutoff.

Compute cluster/atom requires a pair style be defined

This is so that the pair style defines a cutoff distance which is used to find clusters.

Compute com/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute coord/atom cutoff is longer than pairwise cutoff

Cannot compute coordination at distances longer than the pair cutoff, since those atoms are not in the neighbor list.

Compute damage/atom requires peridynamic potential

Damage is a Peridynamic-specific metric. It requires you to be running a Peridynamics simulation.

Compute dihedral/local used when dihedrals are not allowed

The atom style does not support dihedrals.

Compute does not allow an extra compute or fix to be reset

This is an internal LAMMPS error. Please report it to the developers.

Compute erotate/asphere requires extended particles

This compute cannot be used with point particles.

Compute event/displace has invalid fix event assigned

This is an internal LAMMPS error. Please report it to the developers.

Compute gyration/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute hexorder/atom cutoff is longer than pairwise cutoff

Cannot compute order parameter beyond cutoff.

Compute improper/local used when impropers are not allowed

The atom style does not support impropers.

Compute inertia/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute msd/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute msd/chunk nchunk is not static

This is required because the MSD cannot be computed consistently if the number of chunks is changing. Compute chunk/atom allows setting nchunk to be static.

Compute omega/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute orientorder/atom cutoff is longer than pairwise cutoff

Cannot compute order parameter beyond cutoff.

Compute pair must use group all

Pair styles accumulate energy on all atoms.

Compute pe must use group all

Energies computed by potentials (pair, bond, etc) are computed on all atoms.

Compute pressure must use group all

Virial contributions computed by potentials (pair, bond, etc) are computed on all atoms.

Compute pressure requires temperature ID to include kinetic energy

The keflag cannot be used unless a temperature compute is provided.

Compute pressure temperature ID does not compute temperature

The compute ID assigned to a pressure computation must compute temperature.

Compute property/atom floating point vector does not exist

The command is accessing a vector added by the fix property/atom command, that does not exist.

Compute property/atom integer vector does not exist

The command is accessing a vector added by the fix property/atom command, that does not exist.

Compute property/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute property/local cannot use these inputs together

Only inputs that generate the same number of datums can be used together. E.g. bond and angle quantities cannot be mixed.

Compute reduce compute calculates global values

A compute that calculates peratom or local values is required.

Compute reduce fix calculates global values

A fix that calculates peratom or local values is required.

Compute stress/atom temperature ID does not compute temperature

The specified compute must compute temperature.

Compute temp/asphere requires extended particles

This compute cannot be used with point particles.

Compute temp/body requires bodies

This compute can only be applied to body particles.

Compute temp/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute temp/cs requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Compute temp/cs used when bonds are not allowed

This compute only works on pairs of bonded particles.

Compute torque/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute used in dump between runs is not current

The compute was not invoked on the current timestep, therefore it cannot be used in a dump between runs.

Compute used in variable between runs is not current

Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the page for the variable command for more info.

Compute used in variable thermo keyword between runs is not current

Some thermo keywords rely on a compute to calculate their value(s). Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the page for the variable command for more info.

Compute vcm/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Computed temperature for fix temp/rescale cannot be 0.0

Cannot rescale the temperature to a new value if the current temperature is 0.0.

Core/shell partner atom not found

Could not find one of the atoms in the bond pair.

Core/shell partners were not all found

Could not find or more atoms in the bond pairs.

Could not adjust g_ewald_6

The Newton-Raphson solver failed to converge to a good value for g_ewald. This error should not occur for typical problems. Please send an email to the developers.

Could not compute g_ewald

The Newton-Raphson solver failed to converge to a good value for g_ewald. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size for Coulomb interaction

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size for Dispersion

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not create 3d FFT plan

The FFT setup for the PPPM solver failed, typically due to lack of memory. This is an unusual error. Check the size of the FFT grid you are requesting.

Could not create 3d grid of processors

The specified constraints did not allow a Px by Py by Pz grid to be created where $P_x * P_y * P_z = P$ = total number of processors.

Could not create 3d remap plan

The FFT setup in pppm failed.

Could not create Python function arguments

This is an internal Python error, possibly because the number of inputs to the function is too large.

Could not create numa grid of processors

The specified constraints did not allow this style of grid to be created. Usually this is because the total processor count is not a multiple of the cores/node or the user specified processor count is > 1 in one of the dimensions.

Could not create twolevel 3d grid of processors

The specified constraints did not allow this style of grid to be created.

Could not find Python function

The provided Python code was run successfully, but it not define a callable function with the required name.

Could not find change_box group ID

Group ID used in the change_box command does not exist.

Could not find compute msd/chunk fix ID

The compute creates an internal fix, which has been deleted.

Could not find compute pressure temperature ID

The compute ID for calculating temperature does not exist.

Could not find delete_atoms group ID

Group ID used in the delete_atoms command does not exist.

Could not find delete_atoms region ID

Region ID used in the delete_atoms command does not exist.

Could not find displace_atoms group ID

Group ID used in the displace_atoms command does not exist.

Could not find dump group ID

A group ID used in the dump command does not exist.

Could not find fix adapt storage fix ID

This should not happen unless you explicitly deleted a secondary fix that fix adapt created internally.

Could not find fix group ID

A group ID used in the fix command does not exist.

Could not find fix recenter group ID

A group ID used in the fix recenter command does not exist.

Could not find fix rigid group ID

A group ID used in the fix rigid command does not exist.

Could not find fix_modify ID

A fix ID used in the fix_modify command does not exist.

Could not find fix_modify pressure ID

The compute ID for computing pressure does not exist.

Could not find fix_modify temperature ID

The compute ID for computing temperature does not exist.

Could not find pair fix ID

A fix is created internally by the pair style to store shear history information. You cannot delete it.

Could not find set group ID

Group ID specified in set command does not exist.

Could not find thermo compute ID

Compute ID specified in thermo_style command does not exist.

Could not find thermo custom compute ID

The compute ID needed by thermo style custom to compute a requested quantity does not exist.

Could not find thermo custom fix ID

The fix ID needed by thermo style custom to compute a requested quantity does not exist.

Could not find thermo fix ID

Fix ID specified in thermo_style command does not exist.

Could not find thermo_modify pressure ID

The compute ID needed by thermo style custom to compute pressure does not exist.

Could not find thermo_modify temperature ID

The compute ID needed by thermo style custom to compute temperature does not exist.

Could not find undump ID

A dump ID used in the undump command does not exist.

Could not find velocity group ID

A group ID used in the velocity command does not exist.

Could not find velocity temperature ID

The compute ID needed by the velocity command to compute temperature does not exist.

Could not find/initialize a specified accelerator device

Could not initialize at least one of the devices specified for the gpu package

Could not initialize embedded Python

The main module in Python was not accessible.

Could not open Python file

The specified file of Python code cannot be opened. Check that the path and name are correct.

Could not process Python file

The Python code in the specified file was not run successfully by Python, probably due to errors in the Python code.

Could not process Python string

The Python code in the here string was not run successfully by Python, probably due to errors in the Python code.

Coulomb PPPMDisp order has been reduced below minorder

The default minimum order is 2. This can be reset by the `kpace_modify minorder` command.

Coulombic cutoff not supported in pair_style buck/long/coul/coul

Must use long-range Coulombic interactions.

Coulombic cutoff not supported in pair_style lj/long/coul/long

Must use long-range Coulombic interactions.

Coulombic cutoff not supported in pair_style lj/long/tip4p/long

Must use long-range Coulombic interactions.

Coulombic cutoffs of pair hybrid sub-styles do not match

If using a Kspace solver, all Coulombic cutoffs of long pair styles must be the same.

Coulombic cut not supported in pair_style lj/long/dipole/long

Must use long-range Coulombic interactions.

Create_atoms command before simulation box is defined

The `create_atoms` command cannot be used before a `read_data`, `read_restart`, or `create_box` command.

Create_atoms molecule has atom IDs, but system does not

The `atom_style id` command can be used to force atom IDs to be stored.

Create_atoms molecule must have atom types

The defined molecule does not specify atom types.

Create_atoms molecule must have coordinates

The defined molecule does not specify coordinates.

Create_atoms region ID does not exist

A region ID used in the `create_atoms` command does not exist.

Create_bonds command requires no kspace_style be defined

This is so that atom pairs that are already bonded to not appear in the neighbor list.

Create_bonds command requires special_bonds 1-2 weights be 0.0

This is so that atom pairs that are already bonded to not appear in the neighbor list.

Create_bonds max distance > neighbor cutoff

Can only create bonds for atom pairs that will be in neighbor list.

Create_box region does not support a bounding box

Not all regions represent bounded volumes. You cannot use such a region with the `create_box` command.

Custom floating point vector for fix store/state does not exist

The command is accessing a vector added by the `fix property/atom` command, that does not exist.

Custom integer vector for fix store/state does not exist

The command is accessing a vector added by the `fix property/atom` command, that does not exist.

Degenerate lattice primitive vectors

Invalid set of 3 lattice vectors for `lattice` command.

Delete_atoms command before simulation box is defined

The `delete_atoms` command cannot be used before a `read_data`, `read_restart`, or `create_box` command.

Delete_atoms cutoff > max neighbor cutoff

Can only delete atoms in atom pairs that will be in neighbor list.

Delete_atoms mol yes requires atom attribute molecule

Cannot use this option with a non-molecular system.

Delete_atoms requires a pair style be defined

This is because atom deletion within a cutoff uses a pairwise neighbor list.

Delete_bonds command before simulation box is defined

The delete_bonds command cannot be used before a read_data, read_restart, or create_box command.

Delete_bonds command with no atoms existing

No atoms are yet defined so the delete_bonds command cannot be used.

Did not assign all restart atoms correctly

Atoms read in from the restart file were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box. Normally this should not happen. You may wish to use the “remap” option on the read_restart command to see if this helps.

Did not find all elements in MEAM library file

Some requested elements were not found in the MEAM file. Check spelling etc.

Did not find fix shake partner info

Could not find bond partners implied by fix shake command. This error can be triggered if the delete_bonds command was used before fix shake, and it removed bonds without resetting the 1-2, 1-3, 1-4 weighting list via the special keyword.

Did not find keyword in table file

Keyword used in pair_coeff command was not found in table file.

Did not set pressure for fix rigid/nph

The press keyword must be specified.

Did not set temperature for fix rigid/nvt

The temp keyword must be specified.

Did not set temperature or pressure for fix rigid/npt

The temp and press keywords must be specified.

Dihedral atom missing in delete_bonds

The delete_bonds command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

Dihedral atom missing in set command

The set command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

Dihedral charmm is incompatible with Pair style

Dihedral style charmm must be used with a pair style charmm in order for the 1-4 epsilon/sigma parameters to be defined.

Dihedral coeff for hybrid has invalid style

Dihedral style hybrid uses another dihedral style as one of its coefficients. The dihedral style used in the dihedral_coeff command or read from a restart file is not recognized.

Dihedral coeffs are not set

No dihedral coefficients have been assigned in the data file or via the dihedral_coeff command.

Dihedral/improper extent > half of periodic box length

This error was detected by the neigh_modify check yes setting. It is an error because the dihedral atoms are so far apart it is ambiguous how it should be defined.

Dihedral_coeff command before dihedral_style is defined

Coefficients cannot be set in the data file or via the dihedral_coeff command until an dihedral_style has been assigned.

Dihedral_coeff command before simulation box is defined

The dihedral_coeff command cannot be used before a read_data, read_restart, or create_box command.

Dihedral_coeff command when no dihedrals allowed

The chosen atom style does not allow for dihedrals to be defined.

Dihedral_style command when no dihedrals allowed

The chosen atom style does not allow for dihedrals to be defined.

Dihedrals assigned incorrectly

Dihedrals read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Dihedrals defined but no dihedral types

The data file header lists dihedrals but no dihedral types.

Dimension command after simulation box is defined

The dimension command cannot be used after a read_data, read_restart, or create_box command.

Dispersion PPPMDisp order has been reduced below minorder

The default minimum order is 2. This can be reset by the kspace_modify minorder command.

Displace_atoms command before simulation box is defined

The displace_atoms command cannot be used before a read_data, read_restart, or create_box command.

Divide by 0 in influence function

This should not normally occur. It is likely a problem with your model.

Divide by 0 in influence function of pair peri/lps

This should not normally occur. It is likely a problem with your model.

Dump atom/gz only writes compressed files

The dump atom/gz output file name must have a .gz suffix.

Dump cfg arguments must start with 'mass type xs ys zs' or 'mass type xsu ysu zsu'

This is a requirement of the CFG output format. See the dump cfg doc page for more details.

Dump cfg requires one snapshot per file

Use the wildcard "*" character in the filename.

Dump cfg/gz only writes compressed files

The dump cfg/gz output file name must have a .gz suffix.

Dump custom and fix not computed at compatible times

The fix must produce per-atom quantities on timesteps that dump custom needs them.

Dump custom variable is not atom-style variable

Only atom-style variables generate per-atom quantities, needed for dump output.

Dump custom/gz only writes compressed files

The dump custom/gz output file name must have a .gz suffix.

Dump dcd of non-matching # of atoms

Every snapshot written by dump dcd must contain the same # of atoms.

Dump dcd requires sorting by atom ID

Use the dump_modify sort command to enable this.

Dump every variable returned a bad timestep

The variable must return a timestep greater than the current timestep.

Dump image requires one snapshot per file

Use a “*” in the filename.

Dump local and fix not computed at compatible times

The fix must produce per-atom quantities on timesteps that dump local needs them.

Dump local cannot sort by atom ID

This is because dump local does not really dump per-atom info.

Dump local count is not consistent across input fields

Every column of output must be the same length.

Dump modify element names do not match atom types

Number of element names must equal number of atom types.

Dump xtc requires sorting by atom ID

Use the dump_modify sort command to enable this.

Dump xyz/gz only writes compressed files

The dump xyz/gz output file name must have a .gz suffix.

Dump_modify format string is too short

There are more fields to be dumped in a line of output than your format string specifies.

Dumping an atom property that is not allocated

The chosen atom style does not define the per-atom quantity being dumped.

Duplicate particle in PeriDynamic bond - simulation box is too small

This is likely because your box length is shorter than 2 times the bond length.

Electronic temperature dropped below zero

Something has gone wrong with the fix ttm electron temperature model.

Element not defined in potential file

The specified element is not in the potential file.

Empty brackets in variable

There is no variable syntax that uses empty brackets. Check the variable doc page.

Epsilon or sigma reference not set by pair style in ewald/n

The pair style is not providing the needed epsilon or sigma values.

Error in vdw spline: inner radius > outer radius

A pre-tabulated spline is invalid. Likely a problem with the potential parameters.

Error writing averaged chunk data

Something in the output to the file triggered an error.

Error writing file header

Something in the output to the file triggered an error.

Error writing out correlation data

Something in the output to the file triggered an error.

Error writing out histogram data

Something in the output to the file triggered an error.

Error writing out time averaged data

Something in the output to the file triggered an error.

Failed to allocate %ld bytes for array %s

Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.

Failed to open FFMpeg pipeline to file %s

The specified file cannot be opened. Check that the path and name are correct and writable and that the FFMpeg executable can be found and run.

Failed to reallocate %ld bytes for array %s

Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.

Fewer SRD bins than processors in some dimension

This is not allowed. Make your SRD bin size smaller.

File variable could not read value

Check the file assigned to the variable.

Fix %s does not allow use of dynamic group

Dynamic groups have not yet been enabled for this fix.

Fix SRD: bad bin assignment for SRD advection

Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: bad search bin assignment

Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: bad stencil bin for big particle

Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: too many big particles in bin

Reset the ATOMPERBIN parameter at the top of fix_srd.cpp to a larger value, and re-compile the code.

Fix SRD: too many walls in bin

This should not happen unless your system has been setup incorrectly.

Fix adapt interface to this pair style not supported

New coding for the pair style would need to be done.

Fix adapt pair style param not supported

The pair style does not know about the parameter you specified.

Fix adapt requires atom attribute charge

The atom style being used does not specify an atom charge.

Fix adapt requires atom attribute diameter

The atom style being used does not specify an atom diameter.

Fix append/atoms requires a lattice be defined

Use the lattice command for this purpose.

Fix ave/atom compute does not calculate a per-atom vector

A compute used by fix ave/atom must generate per-atom values.

Fix ave/atom compute does not calculate per-atom values

A compute used by fix ave/atom must generate per-atom values.

Fix ave/atom fix does not calculate a per-atom vector

A fix used by fix ave/atom must generate per-atom values.

Fix ave/atom fix does not calculate per-atom values

A fix used by fix ave/atom must generate per-atom values.

Fix ave/atom variable is not atom-style variable

A variable used by fix ave/atom must generate per-atom values.

Fix ave/chunk does not use chunk/atom compute

The specified compute is not for a compute chunk/atom command.

Fix ave/histo inputs are not all global, peratom, or local

All inputs in a single fix ave/histo command must be of the same style.

Fix ave/time cannot set output array intensive/extensive from these inputs

One of more of the vector inputs has individual elements which are flagged as intensive or extensive. Such an input cannot be flagged as all intensive/extensive when turned into an array by fix ave/time.

Fix ave/time cannot use variable with vector mode

Variables produce scalar values.

Fix balance rcb cannot be used with comm_style brick

Comm_style tiled must be used instead.

Fix balance shift string is invalid

The string can only contain the characters “x”, “y”, or “z”.

Fix bond/break needs ghost atoms from further away

This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm_modify cutoff command can be used to extend the communication range.

Fix bond/create cutoff is longer than pairwise cutoff

This is not allowed because bond creation is done using the pairwise neighbor list.

Fix bond/create induced too many angles/dihedrals/impropers per atom

See the read_data command for info on using the “extra/angle/per/atom”, (or dihedral, improper) keywords to allow for additional angles, dihedrals, and impropers to be formed.

Fix bond/create needs ghost atoms from further away

This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm_modify cutoff command can be used to extend the communication range.

Fix bond/react: Cannot use fix bond/react with non-molecular systems

Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Fix bond/react: Invalid template atom ID in map file

Atom IDs in molecule templates range from 1 to the number of atoms in the template.

Fix bond/react: Rmax cutoff is longer than pairwise cutoff

This is not allowed because bond creation is done using the pairwise neighbor list.

Fix bond/react: Molecule template ID for fix bond/react does not exist

A valid molecule template must have been created with the molecule command.

Fix bond/react: Reaction templates must contain the same number of atoms

There should be a one-to-one correspondence between atoms in the pre-reacted and post-reacted templates, as specified by the map file.

Fix bond/react: Unknown section in map file

Please ensure reaction map files are properly formatted.

Fix bond/react: Atom/Bond type affected by reaction too close to template edge

This means an atom which changes type or connectivity during the reaction is too close to an ‘edge’ atom defined in the map file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

Fix bond/react: Fix bond/react needs ghost atoms from farther away

This is because a processor needs to map the entire unreacted molecule template onto simulation atoms it knows about. The comm_modify cutoff command can be used to extend the communication range.

Fix bond/react: Molecule template ‘Coords’ section required for chiralIDs keyword

The coordinates of atoms in the pre-reacted template are used to determine chirality.

Fix bond/react special bond generation overflow

The number of special bonds per-atom created by a reaction exceeds the system setting. See the read_data or create_box command for how to specify this value.

Fix bond/react topology/atom exceed system topology/atom

The number of bonds, angles etc per-atom created by a reaction exceeds the system setting. See the read_data or create_box command for how to specify this value.

Fix bond/swap cannot use dihedral or improper styles

These styles cannot be defined when using this fix.

Fix box/relax generated negative box length

The pressure being applied is likely too large. Try applying it incrementally, to build to the high pressure.

Fix command before simulation box is defined

The fix command cannot be used before a read_data, read_restart, or create_box command.

Fix deform cannot use yz variable with xy

The yz setting cannot be a variable if xy deformation is also specified. This is because LAMMPS cannot determine if the yz setting will induce a box flip which would be invalid if xy is also changing.

Fix deform is changing yz too much with xy

When both yz and xy are changing, it induces changes in xz if the box must flip from one tilt extreme to another. Thus it is not allowed for yz to grow so much that a flip is induced.

Fix deform tilt factors require triclinic box

Cannot deform the tilt factors of a simulation box unless it is a triclinic (non-orthogonal) box.

Fix deform volume setting is invalid

Cannot use volume style unless other dimensions are being controlled.

Fix deposit molecule must have atom types

The defined molecule does not specify atom types.

Fix deposit molecule must have coordinates

The defined molecule does not specify coordinates.

Fix deposit molecule template ID must be same as atom_style template ID

When using atom_style template, you cannot deposit molecules that are not in that template.

Fix deposit region cannot be dynamic

Only static regions can be used with fix deposit.

Fix deposit region does not support a bounding box

Not all regions represent bounded volumes. You cannot use such a region with the fix deposit command.

Fix efield requires atom attribute q or mu

The atom style defined does not have this attribute.

Fix efield with dipoles cannot use atom-style variables

This option is not supported.

Fix evaporate molecule requires atom attribute molecule

The atom style being used does not define a molecule ID.

Fix external callback function not set

This must be done by an external program in order to use this fix.

Fix for fix ave/atom not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/atom is requesting a value on a non-allowed timestep.

Fix for fix ave/chunk not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/chunk is requesting a value on a non-allowed timestep.

Fix for fix ave/correlate not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/correlate is requesting a value on a non-allowed timestep.

Fix for fix ave/histo not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/histo is requesting a value on a non-allowed timestep.

Fix for fix ave/spatial not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/spatial is requesting a value on a non-allowed timestep.

Fix for fix ave/time not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/time is requesting a value on a non-allowed timestep.

Fix for fix store/state not computed at compatible time

Fixes generate their values on specific timesteps. Fix store/state is requesting a value on a non-allowed timestep.

Fix for fix vector not computed at compatible time

Fixes generate their values on specific timesteps. Fix vector is requesting a value on a non-allowed timestep.

Fix freeze requires atom attribute torque

The atom style defined does not have this attribute.

Fix gcmc cannot exchange individual atoms belonging to a molecule

This is an error since you should not delete only one atom of a molecule. The user has specified atomic (non-molecular) gas exchanges, but an atom belonging to a molecule could be deleted.

Fix gcmc molecule command requires that atoms have molecule attributes

Should not choose the gcmc molecule feature if no molecules are being simulated. The general molecule flag is off, but gcmc's molecule flag is on.

Fix gcmc molecule must have atom types

The defined molecule does not specify atom types.

Fix gcmc molecule must have coordinates

The defined molecule does not specify coordinates.

Fix gcmc molecule template ID must be same as atom_style template ID

When using atom_style template, you cannot insert molecules that are not in that template.

Fix gcmc put atom outside box

This should not normally happen. Contact the developers.

Fix gcmc ran out of available atom IDs

See the setting for tagint in the src/lmptype.h file.

Fix gcmc ran out of available molecule IDs

See the setting for tagint in the src/lmptype.h file.

Fix gcmc region cannot be dynamic

Only static regions can be used with fix gcmc.

Fix gcmc region does not support a bounding box

Not all regions represent bounded volumes. You cannot use such a region with the fix gcmc command.

Fix heat kinetic energy of an atom went negative

This will cause the velocity rescaling about to be performed by fix heat to be invalid.

Fix heat kinetic energy went negative

This will cause the velocity rescaling about to be performed by fix heat to be invalid.

Fix in variable not computed at compatible time

Fixes generate their values on specific timesteps. The variable is requesting the values on a non-allowed timestep.

Fix langevin angmom is not yet implemented with kokkos

This option is not yet available.

Fix langevin angmom requires extended particles

This fix option cannot be used with point particles.

Fix langevin gif cannot have period equal to dt/2

If the period is equal to dt/2 then division by zero will happen.

Fix langevin omega is not yet implemented with kokkos

This option is not yet available.

Fix langevin omega requires extended particles

One of the particles has radius 0.0.

Fix langevin period must be > 0.0

The time window for temperature relaxation must be > 0

Fix npt/nph has tilted box too far in one step - periodic cell is too far from equilibrium state

Self-explanatory. The change in the box tilt is too extreme on a short timescale.

Fix numdiff requires an atom map, see atom_modify

Self-explanatory. Efficient loop over all atoms for numerical difference requires an atom map.

Fix numdiff requires consecutive atom IDs

Self-explanatory. Efficient loop over all atoms for numerical difference requires consecutive atom IDs.

Fix numdiff/virial must use group all

Virial contributions computed by this fix are computed on all atoms.

Fix nve/asphere requires extended particles

This fix can only be used for particles with a shape setting.

Fix nve/asphere/noforce requires extended particles

One of the particles is not an ellipsoid.

Fix nve/body requires bodies

This fix can only be used for particles that are bodies.

Fix nve/sphere dipole requires atom attribute mu

An atom style with this attribute is needed.

Fix nve/sphere requires extended particles

This fix can only be used for particles of a finite size.

Fix nvt/nph/npt asphere requires extended particles

The shape setting for a particle in the fix group has shape = 0.0, which means it is a point particle.

Fix nvt/sphere requires extended particles

This fix can only be used for particles of a finite size.

Fix orient/fcc file open failed

The fix orient/fcc command could not open a specified file.

Fix orient/fcc file read failed

The fix orient/fcc command could not read the needed parameters from a specified file.

Fix orient/fcc found self twice

The neighbor lists used by fix orient/fcc are messed up. If this error occurs, it is likely a bug, so send an email to the [developers](#).

Fix peri neigh does not exist

Somehow a fix that the pair style defines has been deleted.

Fix pour molecule must have atom types

The defined molecule does not specify atom types.

Fix pour molecule must have coordinates

The defined molecule does not specify coordinates.

Fix pour molecule template ID must be same as atom style template ID

When using atom_style template, you cannot pour molecules that are not in that template.

Fix pour region cannot be dynamic

Only static regions can be used with fix pour.

Fix pour region does not support a bounding box

Not all regions represent bounded volumes. You cannot use such a region with the fix pour command.

Fix pour requires atom attributes radius, rmass

The atom style defined does not have these attributes.

Fix property/atom vector name already exists

The name for an integer or floating-point vector must be unique.

Fix qeq/comb requires atom attribute q

An atom style with charge must be used to perform charge equilibration.

Fix qeq/point has insufficient QEq matrix size

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/shielded has insufficient QEq matrix size

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/slater could not extract params from pair coul/streitz

This should not happen unless pair coul/streitz has been altered.

Fix qeq/slater has insufficient QEq matrix size

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix reax/bonds numbonds > nsbmax_most

The limit of the number of bonds expected by the ReaxFF force field was exceeded.

Fix rigid atom has non-zero image flag in a non-periodic dimension

Image flags for non-periodic dimensions should not be set.

Fix rigid npt/nph does not yet allow triclinic box

This is a current restriction in LAMMPS.

Fix rigid/small atom has non-zero image flag in a non-periodic dimension

Image flags for non-periodic dimensions should not be set.

Fix rigid/small molecule must have atom types

The defined molecule does not specify atom types.

Fix rigid/small molecule must have coordinates

The defined molecule does not specify coordinates.

Fix rigid: Bad principal moments

The principal moments of inertia computed for a rigid body are not within the required tolerances.

Fix shake molecule template must have shake info

The defined molecule does not specify SHAKE information.

Fix srd can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

Fix srd lamda must be ≥ 0.6 of SRD grid size

This is a requirement for accuracy reasons.

Fix srd no-slip requires atom attribute torque

This is because the SRD collisions will impart torque to the solute particles.

Fix srd requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Fix store/state compute does not calculate a per-atom array

The compute calculates a per-atom vector.

Fix store/state compute does not calculate a per-atom vector

The compute calculates a per-atom vector.

Fix store/state compute does not calculate per-atom values

Computes that calculate global or local quantities cannot be used with fix store/state.

Fix store/state fix does not calculate a per-atom array

The fix calculates a per-atom vector.

Fix store/state fix does not calculate a per-atom vector

The fix calculates a per-atom array.

Fix store/state fix does not calculate per-atom values

Fixes that calculate global or local quantities cannot be used with fix store/state.

Fix store/state variable is not atom-style variable

Only atom-style variables calculate per-atom quantities.

Fix temp/csld is not compatible with fix rattle or fix shake

These two commands cannot currently be used together with fix temp/csld.

Fix tfmc is not compatible with fix shake

These two commands cannot currently be used together.

Fix tmd must come after integration fixes

Any fix tmd command must appear in the input script after all time integration fixes (nve, nvt, npt). See the fix tmd documentation for details.

Fix used in compute chunk/atom not computed at compatible time

The chunk/atom compute cannot query the output of the fix on a timestep it is needed.

Fix used in compute reduce not computed at compatible time

Fixes generate their values on specific timesteps. Compute reduce is requesting a value on a non-allowed timestep.

Fix used in compute slice not computed at compatible time

Fixes generate their values on specific timesteps. Compute slice is requesting a value on a non-allowed timestep.

Fix vector cannot set output array intensive/extensive from these inputs

The inputs to the command have conflicting intensive/extensive attributes. You need to use more than one fix vector command.

Fix wall/colloid requires extended particles

One of the particles has radius 0.0.

Fix wall/gran is incompatible with Pair style

Must use a granular pair style to define the parameters needed for this fix.

Fix wall/piston command only available at zlo

The face keyword must be zlo.

Fix wall/region colloid requires extended particles

One of the particles has radius 0.0.

Fix_modify pressure ID does not compute pressure

The compute ID assigned to the fix must compute pressure.

Fix_modify temperature ID does not compute temperature

The compute ID assigned to the fix must compute temperature.

For triclinic deformation, specified target stress must be hydrostatic

Triclinic pressure control is allowed using the tri keyword, but non-hydrostatic pressure control can not be used in this case.

Found no restart file matching pattern

When using a "*" in the restart file name, no matching file was found.

GPU particle split must be set to 1 for this pair style.

For this pair style, you cannot run part of the force calculation on the host. See the package command.

GPUs are requested but Kokkos has not been compiled for CUDA

Re-compile Kokkos with CUDA support to use GPUs.

Ghost velocity forward comm not yet implemented with Kokkos

This is a current restriction.

Gmask function in equal-style variable formula

Gmask is per-atom operation.

Gravity changed since fix pour was created

The gravity vector defined by fix gravity must be static.

Gmask function in equal-style variable formula

Grmask is per-atom operation.

Group ID does not exist

A group ID used in the group command does not exist.

Group all cannot be made dynamic

This operation is not allowed.

Group command before simulation box is defined

The group command cannot be used before a read_data, read_restart, or create_box command.

Group region ID does not exist

A region ID used in the group command does not exist.

If read_dump purges it cannot replace or trim

These operations are not compatible. See the read_dump doc page for details.

Illegal ... command

Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

Illegal COMB parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal COMB3 parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal Stillinger-Weber parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal Tersoff parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal Vashishta parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal coul/streitz parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal fix gcmc gas mass <= 0

The computed mass of the designated gas molecule or atom type was less than or equal to zero.

Illegal fix tfmc random seed

Seeds can only be nonzero positive integers.

Illegal fix wall/piston velocity

The piston velocity must be positive.

Illegal nb3b/harmonic parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal number of angle table entries

There must be at least 2 table entries.

Illegal number of bond table entries

There must be at least 2 table entries.

Illegal number of pair table entries

There must be at least 2 table entries.

Illegal or unset periodicity in restart

This error should not normally occur unless the restart file is invalid.

Illegal range increment value

The increment must be ≥ 1 .

Illegal simulation box

The lower bound of the simulation box is greater than the upper bound.

Illegal size double vector read requested

This error should not normally occur unless the restart file is invalid.

Illegal size integer vector read requested

This error should not normally occur unless the restart file is invalid.

Illegal size string or corrupt restart

This error should not normally occur unless the restart file is invalid.

Imageint setting in lmptype.h is invalid

Imageint must be as large or larger than smallint.

Imageint setting in lmptype.h is not compatible

Format of imageint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Improper atom missing in delete_bonds

The delete_bonds command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

Improper atom missing in set command

The set command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

Improper coeff for hybrid has invalid style

Improper style hybrid uses another improper style as one of its coefficients. The improper style used in the improper_coeff command or read from a restart file is not recognized.

Improper coeffs are not set

No improper coefficients have been assigned in the data file or via the `improper_coeff` command.

Improper_coeff command before improper_style is defined

Coefficients cannot be set in the data file or via the `improper_coeff` command until an `improper_style` has been assigned.

Improper_coeff command before simulation box is defined

The `improper_coeff` command cannot be used before a `read_data`, `read_restart`, or `create_box` command.

Improper_coeff command when no impropers allowed

The chosen atom style does not allow for impropers to be defined.

Improper_style command when no impropers allowed

The chosen atom style does not allow for impropers to be defined.

Impropers assigned incorrectly

Impropers read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Impropers defined but no improper types

The data file header lists `improper` but no `improper` types.

Incompatible KIM Simulator Model

The requested KIM Simulator Model was defined for a different MD code and thus is not compatible with LAMMPS.

Incompatible units for KIM Simulator Model

The selected unit style is not compatible with the requested KIM Simulator Model.

Incomplete use of variables in create_atoms command

The `var` and `set` options must be used together.

Inconsistent iparam/jparam values in fix bond/create command

If `itype` and `jtype` are the same, then their `maxbond` and `newtype` settings must also be the same.

Inconsistent line segment in data file

The end points of the line segment are not equal distances from the center point which is the atom coordinate.

Inconsistent triangle in data file

The centroid of the triangle as defined by the corner points is not the atom coordinate.

Inconsistent use of finite-size particles by molecule template molecules

Not all of the molecules define a radius for their constituent particles.

Incorrect # of floating-point values in Bodies section of data file

See page for body style.

Incorrect # of integer values in Bodies section of data file

See page for body style.

Incorrect %s format in data file

A section of the data file being read by `fix property/atom` does not have the correct number of values per line.

Incorrect SNAP parameter file

The file cannot be parsed correctly, check its internal syntax.

Incorrect atom format in data file

Number of values per atom line in the data file is not consistent with the atom style.

Incorrect atom format in neb file

The number of fields per line is not what expected.

Incorrect bonus data format in data file

See the read_data page for a description of how various kinds of bonus data must be formatted for certain atom styles.

Incorrect boundaries with slab Ewald

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

Incorrect boundaries with slab EwaldDisp

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

Incorrect boundaries with slab PPPM

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with PPPM.

Incorrect boundaries with slab PPPMDisp

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with ppm/disp.

Incorrect conversion in format string

A format style variable was not using either a %f, a %g, or a %e conversion. Or an immediate variable with format suffix was not using either a %f, a %g or a %e conversion in the format suffix.

Incorrect element names in ADP potential file

The element names in the ADP file do not match those requested.

Incorrect element names in EAM potential file

The element names in the EAM file do not match those requested.

Incorrect format in COMB potential file

Incorrect number of words per line in the potential file.

Incorrect format in COMB3 potential file

Incorrect number of words per line in the potential file.

Incorrect format in MEAM library file

Incorrect number of words per line in the potential file.

Incorrect format in SNAP coefficient file

Incorrect number of words per line in the coefficient file.

Incorrect format in SNAP parameter file

Incorrect number of words per line in the parameter file.

Incorrect format in Stillinger-Weber potential file

Incorrect number of words per line in the potential file.

Incorrect format in TMD target file

Format of file read by fix tmd command is incorrect.

Incorrect format in Tersoff potential file

Incorrect number of words per line in the potential file.

Incorrect format in Vashishta potential file

Incorrect number of words per line in the potential file.

Incorrect format in coul/streitz potential file

Incorrect number of words per line in the potential file.

Incorrect format in nb3b/harmonic potential file

Incorrect number of words per line in the potential file.

Incorrect integer value in Bodies section of data file

See page for body style.

Incorrect rigid body format in fix rigid file

The number of fields per line is not what expected.

Incorrect rigid body format in fix rigid/small file

The number of fields per line is not what expected.

Incorrect velocity format in data file

Each atom style defines a format for the Velocity section of the data file. The read-in lines do not match.

Indexed per-atom vector in variable formula without atom map

Accessing a value from an atom vector requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom_modify map command will force an atom map to be created.

Input line quote not followed by white-space

An end quote must be followed by white-space.

Insufficient Jacobi rotations for body nparticle

Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for rigid body

Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for rigid molecule

Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for triangle

The calculation of the inertia tensor of the triangle failed. This should not happen if it is a reasonably shaped triangle.

Insufficient memory on accelerator

There is insufficient memory on one of the devices specified for the gpu package

Internal error in atom_style body

This error should not occur. Contact the developers.

Invalid LAMMPS restart file

The file does not appear to be a LAMMPS restart file since it does not contain the correct magic string at the beginning.

Invalid molecule ID in molecule file

Molecule ID must be a non-zero positive integer.

Invalid REAX atom type

There is a mis-match between LAMMPS atom types and the elements listed in the ReaxFF force field file.

Invalid angle table length

Length must be 2 or greater.

Invalid angle type in Angles section of data file

Angle type must be positive integer and within range of specified angle types.

Invalid args for non-hybrid pair coefficients

“NULL” is only supported in pair_coeff calls when using pair hybrid

Invalid argument to factorial %d

N must be ≥ 0 and ≤ 167 , otherwise the factorial result is too large.

Invalid atom ID in %s section of data file

An atom in a section of the data file being read by fix property/atom has an invalid atom ID that is ≤ 0 or $>$ the maximum existing atom ID.

Invalid atom ID in Angles section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Atoms section of data file

Atom IDs must be positive integers.

Invalid atom ID in Bodies section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Bonds section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Bonus section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Dihedrals section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Improvers section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Velocities section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom IDs in neb file

An ID in the file was not found in the system.

Invalid atom diameter in molecule file

Diameters must be ≥ 0.0 .

Invalid atom mass for fix shake

Mass specified in fix shake command must be > 0.0 .

Invalid atom mass in molecule file

Masses must be > 0.0 .

Invalid atom type in Atoms section of data file

Atom types must range from 1 to specified # of types.

Invalid atom type in create_atoms command

The create_box command specified the range of valid atom types. An invalid type is being requested.

Invalid atom type in create_atoms mol command

The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in fix atom/swap command

The atom type specified in the atom/swap command does not exist.

Invalid atom type in fix deposit mol command

The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in fix gcmc command

The atom type specified in the gcmc command does not exist.

Invalid atom type in fix pour mol command

The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in molecule file

Atom types must range from 1 to specified # of types.

Invalid atom type in neighbor exclusion list

Atom types must range from 1 to Ntypes inclusive.

Invalid atom type index for fix shake

Atom types must range from 1 to Ntypes inclusive.

Invalid atom types in pair_write command

Atom types must range from 1 to Ntypes inclusive.

Invalid atom vector in variable formula

The atom vector is not recognized.

Invalid atom_style body command

No body style argument was provided.

Invalid basis setting in create_atoms command

The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.

Invalid basis setting in fix append/atoms command

The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.

Invalid bin bounds in compute chunk/atom

The lo/hi values are inconsistent.

Invalid bin bounds in fix ave/spatial

The lo/hi values are inconsistent.

Invalid body nparticle command

Arguments in atom-style command are not correct.

Invalid bond table length

Length must be 2 or greater.

Invalid bond type in Bonds section of data file

Bond type must be positive integer and within range of specified bond types.

Invalid coeffs for this dihedral style

Cannot set class 2 coeffs in data file for this dihedral style.

Invalid color in dump_modify command

The specified color name was not in the list of recognized colors. See the dump_modify doc page.

Invalid color map min/max values

The min/max values are not consistent with either each other or with values in the color map.

Invalid command-line argument

One or more command-line arguments is invalid. Check the syntax of the command you are using to launch LAMMPS.

Invalid compute ID in variable formula

The compute is not recognized.

Invalid create_atoms rotation vector for 2d model

The rotation vector can only have a z component.

Invalid custom OpenCL parameter string.

There are not enough or too many parameters in the custom string for package GPU.

Invalid cutoff in comm_modify command

Specified cutoff must be ≥ 0.0 .

Invalid cutoffs in pair_write command

Inner cutoff must be larger than 0.0 and less than outer cutoff.

Invalid d1 or d2 value for pair colloid coeff

Neither d1 or d2 can be < 0.

Invalid data file section: Angle Coeffs

Atom style does not allow angles.

Invalid data file section: AngleAngle Coeffs

Atom style does not allow impropers.

Invalid data file section: AngleAngleTorsion Coeffs

Atom style does not allow dihedrals.

Invalid data file section: AngleTorsion Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Angles

Atom style does not allow angles.

Invalid data file section: Bodies

Atom style does not allow bodies.

Invalid data file section: Bond Coeffs

Atom style does not allow bonds.

Invalid data file section: BondAngle Coeffs

Atom style does not allow angles.

Invalid data file section: BondBond Coeffs

Atom style does not allow angles.

Invalid data file section: BondBond13 Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Bonds

Atom style does not allow bonds.

Invalid data file section: Dihedral Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Dihedrals

Atom style does not allow dihedrals.

Invalid data file section: Ellipsoids

Atom style does not allow ellipsoids.

Invalid data file section: EndBondTorsion Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Improper Coeffs

Atom style does not allow impropers.

Invalid data file section: Impropers

Atom style does not allow impropers.

Invalid data file section: Lines

Atom style does not allow lines.

Invalid data file section: MiddleBondTorsion Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Triangles

Atom style does not allow triangles.

Invalid delta_conf in tad command

The value must be between 0 and 1 inclusive.

Invalid density in Atoms section of data file

Density value cannot be ≤ 0.0 .

Invalid density in set command

Density must be > 0.0 .

Invalid dihedral type in Dihedrals section of data file

Dihedral type must be positive integer and within range of specified dihedral types.

Invalid displace_atoms rotate axis for 2d

Axis must be in z direction.

Invalid dump dcd filename

Filenames used with the dump dcd style cannot be binary or compressed or cause multiple files to be written.

Invalid dump frequency

Dump frequency must be 1 or greater.

Invalid dump image element name

The specified element name was not in the standard list of elements. See the dump_modify doc page.

Invalid dump image filename

The file produced by dump image cannot be binary and must be for a single processor.

Invalid dump image theta value

Theta must be between 0.0 and 180.0 inclusive.

Invalid dump image zoom value

Zoom value must be > 0.0 .

Invalid dump movie filename

The file produced by dump movie cannot be binary or compressed and must be a single file for a single processor.

Invalid dump xtc filename

Filenames used with the dump xtc style cannot be binary or compressed or cause multiple files to be written.

Invalid dump xyz filename

Filenames used with the dump xyz style cannot be binary or cause files to be written by each processor.

Invalid dump_modify threshold operator

Operator keyword used for threshold specification is not recognized.

Invalid fix ID in variable formula

The fix is not recognized.

Invalid fix box/relax command for a 2d simulation

Fix box/relax styles involving the z dimension cannot be used in a 2d simulation.

Invalid fix box/relax command pressure settings

If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix box/relax pressure settings

Settings for coupled dimensions must be the same.

Invalid fix nvt/npt/nph command for a 2d simulation

Cannot control z dimension in a 2d model.

Invalid fix nvt/npt/nph command pressure settings

If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix nvt/npt/nph pressure settings

Settings for coupled dimensions must be the same.

Invalid fix press/berendsen for a 2d simulation

The z component of pressure cannot be controlled for a 2d model.

Invalid fix press/berendsen pressure settings

Settings for coupled dimensions must be the same.

Invalid fix qeq parameter file

Element index > number of atom types.

Invalid fix rigid npt/nph command for a 2d simulation

Cannot control z dimension in a 2d model.

Invalid fix rigid npt/nph command pressure settings

If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix rigid/small npt/nph command for a 2d simulation

Cannot control z dimension in a 2d model.

Invalid fix rigid/small npt/nph command pressure settings

If multiple dimensions are coupled, those dimensions must be specified.

Invalid flag in force field section of restart file

Unrecognized entry in restart file.

Invalid flag in header section of restart file

Unrecognized entry in restart file.

Invalid flag in peratom section of restart file

The format of this section of the file is not correct.

Invalid flag in type arrays section of restart file

Unrecognized entry in restart file.

Invalid frequency in temper command

Nevery must be > 0.

Invalid group ID in neigh_modify command

A group ID used in the neigh_modify command does not exist.

Invalid group function in variable formula

Group function is not recognized.

Invalid image up vector

Up vector cannot be (0,0,0).

Invalid immediate variable

Syntax of immediate value is incorrect.

Invalid improper type in Improvers section of data file

Improper type must be positive integer and within range of specified improper types.

Invalid index for non-body particles in compute body/local command

Only indices 1,2,3 can be used for non-body particles.

Invalid keyword in pair table parameters

Keyword used in list of table parameters is not recognized.

Invalid option in lattice command for non-custom style

Certain lattice keywords are not supported unless the lattice style is “custom”.

Invalid order of forces within respa levels

For respa, ordering of force computations within respa levels must obey certain rules. E.g. bonds cannot be compute less frequently than angles, pairwise forces cannot be computed less frequently than kspace, etc.

Invalid pair table cutoff

Cutoffs in pair_coeff command are not valid with read-in pair table.

Invalid pair table length

Length of read-in pair table is invalid

Invalid param file for fix qeq/shielded

Invalid value of gamma.

Invalid param file for fix qeq/slater

Zeta value is 0.0.

Invalid partitions in processors part command

Valid partitions are numbered 1 to N and the sender and receiver cannot be the same partition.

Invalid python command

Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

Invalid radius in Atoms section of data file

Radius must be ≥ 0.0 .

Invalid random number seed in fix ttm command

Random number seed must be > 0 .

Invalid random number seed in set command

Random number seed must be > 0 .

Invalid rigid body ID in fix rigid file

The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid command.

Invalid rigid body ID in fix rigid/small file

The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid/small command.

Invalid run command N value

The number of timesteps must fit in a 32-bit integer. If you want to run for more steps than this, perform multiple shorter runs.

Invalid seed for Marsaglia random # generator

The initial seed for this random number generator must be a positive integer less than or equal to 900 million.

Invalid seed for Park random # generator

The initial seed for this random number generator must be a positive integer.

Invalid shape in Triangles section of data file

Two or more of the triangle corners are duplicate points.

Invalid t_event in tad command

The value must be greater than 0.

Invalid template atom in Atoms section of data file

The atom indices must be between 1 to N, where N is the number of atoms in the template molecule the atom belongs to.

Invalid template index in Atoms section of data file

The template indices must be between 1 to N, where N is the number of molecules in the template.

Invalid threads_per_atom specified.

For 3-body potentials on the GPU, the threads_per_atom setting cannot be greater than 4 for NVIDIA GPUs.

Invalid timestep reset for fix ave/atom

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/chunk

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/correlate

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/histo

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/spatial

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/time

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid tmax in tad command

The value must be greater than 0.0.

Invalid type for mass set

Mass command must set a type from 1-N where N is the number of atom types.

Invalid label2type() function syntax in variable formula

The first argument must be a label map kind (atom, bond, angle, dihedral, or improper) and the second argument must be a valid type label that has been assigned to a numeric type.

Invalid use of library file() function

This function is called through the library interface. This error should not occur. Contact the developers if it does.

Invalid value in set command

The value specified for the setting is invalid, likely because it is too small or too large.

Invalid variable evaluation in variable formula

A variable used in a formula could not be evaluated.

Invalid variable name

Variable name used in an input script line is invalid.

Invalid variable name in variable formula

Variable name is not recognized.

Invalid variable style in special function next

Only file-style or atomfile-style variables can be used with next().

Invalid variable style with next command

Variable styles *equal* and *world* cannot be used in a next command.

Invalid volume in set command

Volume must be > 0.0.

Invoked pair single on pair style none

A command (e.g. a dump) attempted to invoke the single() function on a pair style none, which is illegal. You are probably attempting to compute per-atom quantities with an undefined pair style.

Invoking coulombic in pair style lj/coul requires atom attribute q

The atom style defined does not have this attribute.

Invoking coulombic in pair style lj/long/dipole/long requires atom attribute q

The atom style defined does not have these attributes.

KIM Simulator Model has no Model definition

There is no model definition (key: model-defn) in the KIM Simulator Model. Please contact the OpenKIM database maintainers to verify and potentially correct this.

KSpace accuracy must be > 0

The kspace accuracy designated in the input must be greater than zero.

KSpace accuracy too large to estimate G vector

Reduce the accuracy request or specify gewald explicitly via the kspace_modify command.

KSpace accuracy too low

Requested accuracy must be less than 1.0.

KSpace solver requires a pair style

No pair style is defined.

KSpace style does not yet support triclinic geometries

The specified kspace style does not allow for non-orthogonal simulation boxes.

KSpace style has not yet been set

Cannot use kspace_modify command until a kspace style is set.

KSpace style is incompatible with Pair style

Setting a kspace style requires that a pair style with matching long-range Coulombic or dispersion components be used.

Kokkos has been compiled for CUDA but no GPUs are requested

One or more GPUs must be used when Kokkos is compiled for CUDA.

Kspace_modify mesh parameter must be all zero or all positive

Valid kspace mesh parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero (the default).

Kspace_modify mesh/disp parameter must be all zero or all positive

Valid kspace mesh/disp parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero **and** the required accuracy via *force/disp/real* as well as *force/disp/kspace* is set.

Kspace style requires atom attribute q

The atom style defined does not have these attributes.

LAMMPS is not built with Python embedded

This is done by including the PYTHON package before LAMMPS is built. This is required to use python-style variables.

Label map is incomplete: all types must be assigned a unique type label

For a given type-kind (atom types, bond types, etc.) to be written to the data file, all associated types must be assigned a type label, and each type label can be assigned to only one numeric type.

Labelmap command before simulation box is defined

The labelmap command cannot be used before a read_data, read_restart, or create_box command.

Lattice orient vectors are not orthogonal

The three specified lattice orientation vectors must be mutually orthogonal.

Lattice orient vectors are not right-handed

The three specified lattice orientation vectors must create a right-handed coordinate system such that $\mathbf{a}_1 \times \mathbf{a}_2 = \mathbf{a}_3$.

Lattice primitive vectors are collinear

The specified lattice primitive vectors do not form a unit cell with non-zero volume.

Lattice settings are not compatible with 2d simulation

One or more of the specified lattice vectors has a non-zero z component.

Lattice spacings are invalid

Each x,y,z spacing must be > 0.

Lattice style incompatible with simulation dimension

2d simulation can use sq, sq2, or hex lattice. 3d simulation can use sc, bcc, or fcc lattice.

Lost atoms via balance: original %ld current %ld

This should not occur. Report the problem to the developers.

MEAM library error %d

A call to the MEAM Fortran library returned an error.

MPI_LMP_BIGINT and bigint in lmptype.h are not compatible

The size of the MPI datatype does not match the size of a bigint.

MPI_LMP_TAGINT and tagint in lmptype.h are not compatible

The size of the MPI datatype does not match the size of a tagint.

MSM can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

MSM grid is too large

The global MSM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 16384. You likely need to decrease the requested accuracy.

MSM order must be 4, 6, 8, or 10

This is a limitation of the MSM implementation in LAMMPS: the MSM order can only be 4, 6, 8, or 10.

Mass command before simulation box is defined

The mass command cannot be used before a read_data, read_restart, or create_box command.

Matrix factorization to split dispersion coefficients failed

This should not normally happen. Contact the developers.

Min_style command before simulation box is defined

The min_style command cannot be used before a read_data, read_restart, or create_box command.

Minimization could not find thermo_pe compute

This compute is created by the thermo command. It must have been explicitly deleted by an uncompute command.

Minimize command before simulation box is defined

The minimize command cannot be used before a read_data, read_restart, or create_box command.

Mismatched compute in variable formula

A compute is referenced incorrectly or a compute that produces per-atom values is used in an equal-style variable formula.

Mismatched fix in variable formula

A fix is referenced incorrectly or a fix that produces per-atom values is used in an equal-style variable formula.

Mismatched parameter in MEAM library file: z!=lat

The coordination number and lattice do not match, check that consistent values are given.

Mismatched variable in variable formula

A variable is referenced incorrectly or an atom-style variable that produces per-atom values is used in an equal-style variable formula.

Molecule IDs too large for compute chunk/atom

The IDs must not be larger than can be stored in a 32-bit integer since chunk IDs are 32-bit integers.

Molecule file shake flags not before shake atoms

The order of the two sections is important.

Molecule file shake flags not before shake bonds

The order of the two sections is important.

Molecule file shake info is incomplete

All 3 SHAKE sections are needed.

Molecule file special list does not match special count

The number of values in an atom's special list does not match count.

More than one fix deform

Only one fix deform can be defined at a time.

More than one fix freeze

Only one of these fixes can be defined, since the granular pair potentials access it.

More than one fix shake

Only one fix shake can be defined.

Must define angle_style before Angle Coeffs

Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define angle_style before BondAngle Coeffs

Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define angle_style before BondBond Coeffs

Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define bond_style before Bond Coeffs

Must use a bond_style command before reading a data file that defines Bond Coeffs.

Must define dihedral_style before AngleAngleTorsion Coeffs

Must use a dihedral_style command before reading a data file that defines AngleAngleTorsion Coeffs.

Must define dihedral_style before AngleTorsion Coeffs

Must use a dihedral_style command before reading a data file that defines AngleTorsion Coeffs.

Must define dihedral_style before BondBond13 Coeffs

Must use a dihedral_style command before reading a data file that defines BondBond13 Coeffs.

Must define dihedral_style before Dihedral Coeffs

Must use a dihedral_style command before reading a data file that defines Dihedral Coeffs.

Must define dihedral_style before EndBondTorsion Coeffs

Must use a dihedral_style command before reading a data file that defines EndBondTorsion Coeffs.

Must define dihedral_style before MiddleBondTorsion Coeffs

Must use a dihedral_style command before reading a data file that defines MiddleBondTorsion Coeffs.

Must define improper_style before AngleAngle Coeffs

Must use an improper_style command before reading a data file that defines AngleAngle Coeffs.

Must define improper_style before Improper Coeffs

Must use an improper_style command before reading a data file that defines Improper Coeffs.

Must define pair_style before Pair Coeffs

Must use a pair_style command before reading a data file that defines Pair Coeffs.

Must define pair_style before PairIJ Coeffs

Must use a pair_style command before reading a data file that defines PairIJ Coeffs.

Must have more than one processor partition to temper

Cannot use the temper command with only one processor partition. Use the -partition command-line option.

Must read Angle Type Labels before Angles

An Angle Type Labels section of a data file must come before the Angles section.

Must read Atom Type Labels before Atoms

An Atom Type Labels section of a data file must come before the Atoms section.

Must read Atoms before Angles

The Atoms section of a data file must come before an Angles section.

Must read Atoms before Bodies

The Atoms section of a data file must come before a Bodies section.

Must read Atoms before Bonds

The Atoms section of a data file must come before a Bonds section.

Must read Atoms before Dihedrals

The Atoms section of a data file must come before a Dihedrals section.

Must read Atoms before Ellipsoids

The Atoms section of a data file must come before a Ellipsoids section.

Must read Atoms before Improvers

The Atoms section of a data file must come before an Improvers section.

Must read Atoms before Lines

The Atoms section of a data file must come before a Lines section.

Must read Atoms before Triangles

The Atoms section of a data file must come before a Triangles section.

Must read Atoms before Velocities

The Atoms section of a data file must come before a Velocities section.

Must read Bond Type Labels before Bonds

A Bond Type Labels section of a data file must come before the Bonds section.

Must read Dihedral Type Labels before Dihedrals

An Dihedral Type Labels section of a data file must come before the Dihedrals section.

Must read Improper Type Labels before Improvers

An Improper Type Labels section of a data file must come before the Improvers section.

Must re-specify non-restarted pair style (xxx) after read_restart

For pair styles, that do not store their settings in a restart file, it must be defined with a new 'pair_style' command after read_restart.

Must set both respa inner and outer

Cannot use just the inner or outer option with respa without using the other.

Must set number of threads via package omp command

Because you are using the OPENMP package, set the number of threads via its settings, not by the pair_style snap nthreads setting.

Must shrink-wrap piston boundary

The boundary style of the face where the piston is applied must be of type s (shrink-wrapped).

Must specify a region in fix deposit

The region keyword must be specified with this fix.

Must use 'kspace_modify pressure/scalar no' for rRESPA with kspace_style MSM

The kspace scalar pressure option cannot (yet) be used with rRESPA.

Must use 'kpace_modify pressure/scalar no' for tensor components with kspace_style msm

Otherwise MSM will compute only a scalar pressure. See the kspace_modify command for details on this setting.

Must use 'kpace_modify pressure/scalar no' to obtain per-atom virial with kspace_style MSM

The kspace scalar pressure option cannot be used to obtain per-atom virial.

Must use 'kpace_modify pressure/scalar no' with GPU MSM Pair styles

The kspace scalar pressure option is not (yet) compatible with GPU MSM Pair styles.

Must use 'kpace_modify pressure/scalar no' with kspace_style msm/cg

The kspace scalar pressure option is not compatible with kspace_style msm/cg.

Must use -in switch with multiple partitions

A multi-partition simulation cannot read the input script from stdin. The -in command-line option must be used to specify a file.

Must use Kokkos half/thread or full neighbor list with threads or GPUs

Using Kokkos half-neighbor lists with threading is not allowed.

Must use a bond style with TIP4P potential

TIP4P potentials assume bond lengths in water are constrained by a fix shake command.

Must use an angle style with TIP4P potential

TIP4P potentials assume angles in water are constrained by a fix shake command.

Must use atom map style array with Kokkos

See the atom_modify map command.

Must use variable energy with fix addforce

Must define an energy variable when applying a dynamic force during minimization.

Must use variable energy with fix efield

You must define an energy when performing a minimization with a variable E-field.

NEB requires damped dynamics minimizer

Use a different minimization style.

NL ramp in wall/piston only implemented in zlo for now

The ramp keyword can only be used for piston applied to face zlo.

Needed bonus data not in data file

Some atom styles require bonus data. See the read_data page for details.

Needed molecular topology not in data file

The header of the data file indicated bonds, angles, etc would be included, but they are not present.

Neighbor delay must be 0 or multiple of every setting

The delay and every parameters set via the neigh_modify command are inconsistent. If the delay setting is non-zero, then it must be a multiple of the every setting.

Neighbor include group not allowed with ghost neighbors

This is a current restriction within LAMMPS.

Neighbor list overflow, boost neigh_modify one

There are too many neighbors of a single atom. Use the neigh_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

Neighbor multi not yet enabled for ghost neighbors

This is a current restriction within LAMMPS.

Neighbor page size must be >= 10x the one atom setting

This is required to prevent wasting too much memory.

New atom IDs exceed maximum allowed ID

See the setting for tagint in the src/lmptype.h file.

New bond exceeded bonds per atom in create_bonds

See the read_data command for info on using the “extra/bond/per/atom” keyword to allow for additional bonds to be formed

New bond exceeded bonds per atom in fix bond/create

See the read_data command for info on using the “extra/bond/per/atom” keyword to allow for additional bonds to be formed

New bond exceeded special list size in fix bond/create

See the “read_data extra/special/per/atom” command (or the “create_box extra/special/per/atom” command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

Newton bond change after simulation box is defined

The newton command cannot be used to change the newton bond value after a read_data, read_restart, or create_box command.

Next command must list all universe and uloop variables

This is to ensure they stay in sync.

No OpenMP support compiled in

An OpenMP flag is set, but LAMMPS was not built with OpenMP support.

No atoms in data file

The header of the data file indicated that atoms would be included, but they are not present.

No basis atoms in lattice

Basis atoms must be defined for lattice style user.

No count or invalid atom count in molecule file

The number of atoms must be specified.

No dump custom arguments specified

The dump custom command requires that atom quantities be specified to output to dump file.

No fix gravity defined for fix pour

Gravity is required to use fix pour.

No matching element in ADP potential file

The ADP potential file does not contain elements that match the requested elements.

No matching element in EAM potential file

The EAM potential file does not contain elements that match the requested elements.

No molecule topology allowed with atom style template

The data file cannot specify the number of bonds, angles, etc, because this info is inferred from the molecule templates.

No pair coul/streitz for fix qeq/slater

These commands must be used together.

No pair style defined for compute group/group

Cannot calculate group interactions without a pair style defined.

No rigid bodies defined

The fix specification did not end up defining any rigid bodies.

Non integer # of swaps in temper command

Swap frequency in temper command must evenly divide the total # of timesteps.

Number of core atoms != number of shell atoms

There must be a one-to-one pairing of core and shell atoms.

One or more Atom IDs is negative

Atom IDs must be positive integers.

One or more atom IDs is too big

The limit on atom IDs is set by the SMALLBIG, BIGBIG setting in your LAMMPS build. See the [Build settings](#) page for more info.

One or more atom IDs is zero

Either all atoms IDs must be zero or none of them.

One or more atoms belong to multiple rigid bodies

Two or more rigid bodies defined by the fix rigid command cannot contain the same atom.

One or zero atoms in rigid body

Any rigid body defined by the fix rigid command must contain 2 or more atoms.

Overflow of allocated fix vector storage

This should not normally happen if the fix correctly calculated how long the vector will grow to. Contact the developers.

Overlapping large/large in pair colloid

This potential is infinite when there is an overlap.

Overlapping small/large in pair colloid

This potential is infinite when there is an overlap.

PPPM can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

PPPM grid is too large

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPM grid stencil extends beyond nearest neighbor processor

This is not allowed if the kspace_modify overlap setting is no.

PPPM order < minimum allowed order

The default minimum order is 2. This can be reset by the kspace_modify minorder command.

PPPM order cannot be < 2 or > than %d

This is a limitation of the PPPM implementation in LAMMPS.

PPPMDisp Coulomb grid is too large

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPMDisp Dispersion grid is too large

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPMDisp can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

PPPMDisp coulomb order cannot be greater than %d

This is a limitation of the PPPM implementation in LAMMPS.

PPPMDisp used but no parameters set, for further information please see the ppm/disp documentation

An efficient and accurate usage of the ppm/disp requires settings via the kspace_modify command. Please see the ppm/disp documentation for further instructions.

PRD command before simulation box is defined

The prd command cannot be used before a read_data, read_restart, or create_box command.

Package command after simulation box is defined

The package command cannot be used after a read_data, read_restart, or create_box command.

Package gpu command without GPU package installed

The GPU package must be installed via “make yes-gpu” before LAMMPS is built.

Package intel command without INTEL package installed

The INTEL package must be installed via “make yes-intel” before LAMMPS is built.

Package kokkos command without KOKKOS package enabled

The KOKKOS package must be installed via “make yes-kokkos” before LAMMPS is built, and the “-k on” must be used to enable the package.

Package omp command without OPENMP package installed

The OPENMP package must be installed via “make yes-openmp” before LAMMPS is built.

Pair body requires body style nparticle

This pair style is specific to the nparticle body style.

Pair brownian requires extended particles

One of the particles has radius 0.0.

Pair brownian requires monodisperse particles

All particles must be the same finite size.

Pair brownian/poly requires extended particles

One of the particles has radius 0.0.

Pair coeff for hybrid has invalid style

Style in pair coeff must have been listed in pair_style command.

Pair coul/wolf requires atom attribute q

The atom style defined does not have this attribute.

Pair cutoff < Respa interior cutoff

One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.

Pair dipole/cut requires atom attributes q, mu, torque

The atom style defined does not have these attributes.

Pair dipole/cut/gpu requires atom attributes q, mu, torque

The atom style defined does not have this attribute.

Pair dipole/long requires atom attributes q, mu, torque

The atom style defined does not have these attributes.

Pair dipole/sf/gpu requires atom attributes q, mu, torque

The atom style defined does not one or more of these attributes.

Pair distance < table inner cutoff

Two atoms are closer together than the pairwise table allows.

Pair distance > table outer cutoff

Two atoms are further apart than the pairwise table allows.

Pair dpd requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair gayberne epsilon a,b,c coeffs are not all set

Each atom type involved in pair_style gayberne must have these 3 coefficients set at least once.

Pair granular requires atom attributes radius, rmass

The atom style defined does not have these attributes.

Pair granular requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair granular with shear history requires newton pair off

This is a current restriction of the implementation of pair granular styles with history.

Pair hybrid sub-style does not support single call

You are attempting to invoke a single() call on a pair style that does not support it.

Pair hybrid sub-style is not used

No pair_coeff command used a sub-style specified in the pair_style command.

Pair inner cutoff < Respa interior cutoff

One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.

Pair inner cutoff >= Pair outer cutoff

The specified cutoffs for the pair style are inconsistent.

Pair lj/long/dipole/long requires atom attributes mu, torque

The atom style defined does not have these attributes.

Pair lubricate requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair lubricate requires monodisperse particles

All particles must be the same finite size.

Pair lubricate/poly requires extended particles

One of the particles has radius 0.0.

Pair lubricate/poly requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair lubricateU requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair lubricateU requires monodisperse particles

All particles must be the same finite size.

Pair lubricateU/poly requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair peri lattice is not identical in x, y, and z

The lattice defined by the lattice command must be cubic.

Pair peri requires a lattice be defined

Use the lattice command for this purpose.

Pair peri requires an atom map, see atom_modify

Even for atomic systems, an atom map is required to find Peridynamic bonds. Use the atom_modify command to define one.

Pair style AIREBO requires atom IDs

This is a requirement to use the AIREBO potential.

Pair style AIREBO requires newton pair on

See the newton command. This is a restriction to use the AIREBO potential.

Pair style BOP requires atom IDs

This is a requirement to use the BOP potential.

Pair style BOP requires newton pair on

See the newton command. This is a restriction to use the BOP potential.

Pair style COMB requires atom IDs

This is a requirement to use the AIREBO potential.

Pair style COMB requires newton pair on

See the newton command. This is a restriction to use the COMB potential.

Pair style COMB3 requires atom IDs

This is a requirement to use the COMB3 potential.

Pair style COMB3 requires newton pair on

See the newton command. This is a restriction to use the COMB3 potential.

Pair style LCBOP requires atom IDs

This is a requirement to use the LCBOP potential.

Pair style LCBOP requires newton pair on

See the newton command. This is a restriction to use the Tersoff potential.

Pair style MEAM requires newton pair on

See the newton command. This is a restriction to use the MEAM potential.

Pair style SNAP requires newton pair on

See the newton command. This is a restriction to use the SNAP potential.

Pair style Stillinger-Weber requires atom IDs

This is a requirement to use the SW potential.

Pair style Stillinger-Weber requires newton pair on

See the newton command. This is a restriction to use the SW potential.

Pair style Tersoff requires atom IDs

This is a requirement to use the Tersoff potential.

Pair style Tersoff requires newton pair on

See the newton command. This is a restriction to use the Tersoff potential.

Pair style Vashishta requires atom IDs

This is a requirement to use the Vashishta potential.

Pair style Vashishta requires newton pair on

See the newton command. This is a restriction to use the Vashishta potential.

Pair style bop requires comm ghost cutoff at least 3x larger than %g

Use the communicate ghost command to set this. See the pair bop page for more details.

Pair style born/coul/long requires atom attribute q

An atom style that defines this attribute must be used.

Pair style born/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style born/coul/wolf requires atom attribute q

The atom style defined does not have this attribute.

Pair style buck/coul/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style buck/coul/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style buck/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style buck/long/coul/long requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/cut requires atom attribute q

The atom style defined does not have these attributes.

Pair style coul/cut/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/debye/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/dsf requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/dsf/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/long/gpu requires atom attribute q

The atom style defined does not have these attributes.

Pair style does not have extra field requested by compute pair/local

The pair style does not support the pN value requested by the compute pair/local command.

Pair style does not support bond_style quartic

The pair style does not have a single() function, so it can not be invoked by bond_style quartic.

Pair style does not support compute group/group

The pair_style does not have a single() function, so it cannot be invoked by the compute group/group command.

Pair style does not support compute pair/local

The pair style does not have a single() function, so it can not be invoked by compute pair/local.

Pair style does not support compute property/local

The pair style does not have a single() function, so it can not be invoked by fix bond/swap.

Pair style does not support fix bond/swap

The pair style does not have a single() function, so it can not be invoked by fix bond/swap.

Pair style does not support pair_write

The pair style does not have a single() function, so it can not be invoked by pair write.

Pair style does not support rRESPA inner/middle/outer

You are attempting to use rRESPA options with a pair style that does not support them.

Pair style granular with history requires atoms have IDs

Atoms in the simulation do not have IDs, so history effects cannot be tracked by the granular pair potential.

Pair style hbond/dreiding requires newton pair on

See the newton command for details.

Pair style is incompatible with KSpace style

If a pair style with a long-range Coulombic component is selected, then a kspace style must also be used.

Pair style is incompatible with TIP4P KSpace style

The pair style does not have the requires TIP4P settings.

Pair style lj/charmm/coul/charmm requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/charmm/coul/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/charmm/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/class2/coul/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/class2/coul/long requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/class2/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/cut/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/debye/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/dsf requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/cut/coul/dsf/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/long requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/tip4p/cut requires atom IDs

This is a requirement to use this potential.

Pair style lj/cut/tip4p/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/tip4p/cut requires newton pair on

See the newton command. This is a restriction to use this potential.

Pair style lj/cut/tip4p/long requires atom IDs

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style lj/cut/tip4p/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/cut/tip4p/long requires newton pair on

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair style lj/gromacs/coul/gromacs requires atom attribute q

An atom_style with this attribute is needed.

Pair style lj/long/dipole/long does not currently support respa

This feature is not yet supported.

Pair style lj/long/tip4p/long requires atom IDs

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style lj/long/tip4p/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/long/tip4p/long requires newton pair on

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair style lj/spica/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style nb3b/harmonic requires atom IDs

This is a requirement to use this potential.

Pair style nb3b/harmonic requires newton pair on

See the newton command. This is a restriction to use this potential.

Pair style nm/cut/coul/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style nm/cut/coul/long requires atom attribute q

The atom style defined does not have this attribute.

Pair style polymorphic requires atom IDs

This is a requirement to use the polymorphic potential.

Pair style polymorphic requires newton pair on

See the newton command. This is a restriction to use the polymorphic potential.

Pair style reax requires atom IDs

This is a requirement to use the ReaxFF potential.

Pair style reax requires atom attribute q

The atom style defined does not have this attribute.

Pair style reax requires newton pair on

This is a requirement to use the ReaxFF potential.

Pair style requires a KSpace style

No kspace style is defined.

Pair style sw/gpu requires atom IDs

This is a requirement to use this potential.

Pair style sw/gpu requires newton pair off

See the newton command. This is a restriction to use this potential.

Pair style vashishta/gpu requires atom IDs

This is a requirement to use this potential.

Pair style vashishta/gpu requires newton pair off

See the newton command. This is a restriction to use this potential.

Pair style tersoff/gpu requires atom IDs

This is a requirement to use the tersoff/gpu potential.

Pair style tersoff/gpu requires newton pair off

See the newton command. This is a restriction to use this pair style.

Pair style tip4p/cut requires atom IDs

This is a requirement to use this potential.

Pair style tip4p/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style tip4p/cut requires newton pair on

See the newton command. This is a restriction to use this potential.

Pair style tip4p/long requires atom IDs

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style tip4p/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style tip4p/long requires newton pair on

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair table cutoffs must all be equal to use with KSpace

When using pair style table with a long-range KSpace solver, the cutoffs for all atom type pairs must all be the same, since the long-range solver starts at that cutoff.

Pair table parameters did not set N

List of pair table parameters must include N setting.

Pair tersoff/zbl requires metal or real units

This is a current restriction of this pair potential.

Pair tersoff/zbl/kk requires metal or real units

This is a current restriction of this pair potential.

PairKIM only works with 3D problems

This is a current limitation.

Pair_coeff command before simulation box is defined

The pair_coeff command cannot be used before a read_data, read_restart, or create_box command.

Pair_modify special setting for pair hybrid incompatible with global special_bonds setting

Cannot override a setting of 0.0 or 1.0 or change a setting between 0.0 and 1.0.

Particle on or inside fix wall surface

Particles must be “exterior” to the wall in order for energy/force to be calculated.

Particle outside surface of region used in fix wall/region

Particles must be inside the region for energy/force to be calculated. A particle outside the region generates an error.

Per-atom compute in equal-style variable formula

Equal-style variables cannot use per-atom quantities.

Per-atom fix in equal-style variable formula

Equal-style variables cannot use per-atom quantities.

Per-processor system is too big

The number of owned atoms plus ghost atoms on a single processor must fit in 32-bit integer.

Potential energy ID for fix nvt/nph/npt does not exist

A compute for potential energy must be defined.

Potential file has duplicate entry

The potential file has more than one entry for the same element.

Potential file is missing an entry

The potential file does not have a needed entry.

Pressure ID for fix box/relax does not exist

The compute ID needed to compute pressure for the fix does not exist.

Pressure ID for fix press/berendsen does not exist

The compute ID needed to compute pressure for the fix does not exist.

Pressure ID for thermo does not exist

The compute ID needed to compute pressure for thermodynamics does not exist.

Pressure control must be used with fix nphug

A pressure control keyword (iso, aniso, tri, x, y, or z) must be provided.

Processor partitions do not match number of allocated processors

The total number of processors in all partitions must match the number of processors LAMMPS is running on.

Processors command after simulation box is defined

The processors command cannot be used after a read_data, read_restart, or create_box command.

Processors custom grid file is inconsistent

The vales in the custom file are not consistent with the number of processors you are running on or the Px,Py,Pz settings of the processors command. Or there was not a setting for every processor.

Processors grid numa and map style are incompatible

Using numa for gstyle in the processors command requires using cart for the map option.

Processors part option and grid style are incompatible

Cannot use gstyle numa or custom with the part option.

Python function evaluation failed

The Python function did not run successfully and/or did not return a value (if it is supposed to return a value). This is probably due to some error condition in the function.

Python function is not callable

The provided Python code was run successfully, but it not define a callable function with the required name.

Python invoke of undefined function

Cannot invoke a function that has not been previously defined.

Python variable does not match Python function

This matching is defined by the python-style variable and the python command.

Python variable has no function

No python command was used to define the function associated with the python-style variable.

QEQ with 'newton pair off' not supported

See the newton command. This is a restriction to use the QEQ fixes.

R0 < 0 for fix spring command

Equilibrium spring length is invalid.

RATTLE determinant = 0.0

The determinant of the matrix being solved for a single cluster specified by the fix rattle command is numerically invalid.

RATTLE failed

Certain constraints were not satisfied.

Read data add offset is too big

It cannot be larger than the size of atom IDs, e.g. the maximum 32-bit integer.

Read_data shrink wrap did not assign all atoms correctly

This is typically because the box-size specified in the data file is large compared to the actual extent of atoms in

a shrink-wrapped dimension. When LAMMPS shrink-wraps the box atoms will be lost if the processor they are re-assigned to is too far away. Choose a box size closer to the actual extent of the atoms.

Read_dump command before simulation box is defined

The read_dump command cannot be used before a read_data, read_restart, or create_box command.

Read_dump triclinic status does not match simulation

Both the dump snapshot and the current LAMMPS simulation must be using either an orthogonal or triclinic box.

Reax_defs.h setting for NATDEF is too small

Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

Reax_defs.h setting for NNEIGHMAXDEF is too small

Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

Receiving partition in processors part command is already a receiver

Cannot specify a partition to be a receiver twice.

Region union or intersect cannot be dynamic

The sub-regions can be dynamic, but not the combined region.

Region union region ID does not exist

One or more of the region IDs specified by the region union command does not exist.

Replacing a fix, but new style != old style

A fix ID can be used a second time, but only if the style matches the previous fix. In this case it is assumed you want to reset a fix's parameters. This error may mean you are mistakenly re-using a fix ID when you do not intend to.

Replicate command before simulation box is defined

The replicate command cannot be used before a read_data, read_restart, or create_box command.

Replicate did not assign all atoms correctly

Atoms replicated by the replicate command were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box.

Replicated system atom IDs are too big

See the setting for tagint in the src/lmptype.h file.

Replicated system is too big

See the setting for bigint in the src/lmptype.h file.

Required border comm not yet implemented with Kokkos

There are various limitations in the communication options supported by Kokkos.

Rerun command before simulation box is defined

The rerun command cannot be used before a read_data, read_restart, or create_box command.

Resetting timestep size is not allowed with fix move

This is because fix move is moving atoms based on elapsed time.

Respa inner cutoffs are invalid

The first cutoff must be <= the second cutoff.

Respa middle cutoffs are invalid

The first cutoff must be <= the second cutoff.

Restart file byte ordering is not recognized

The file does not appear to be a LAMMPS restart file since it does not contain a recognized byte-ordering flag at the beginning.

Restart file byte ordering is swapped

The file was written on a machine with different byte-ordering than the machine you are reading it on. Convert it to a text data file instead, on the machine you wrote it on.

Restart file incompatible with current version

This is probably because you are trying to read a file created with a version of LAMMPS that is too old compared to the current version. Use your older version of LAMMPS and convert the restart file to a data file.

Restart file is a multi-proc file

The file is inconsistent with the filename you specified for it.

Restart file is not a multi-proc file

The file is inconsistent with the filename you specified for it.

Restart variable returned a bad timestep

The variable must return a timestep greater than the current timestep.

Restrain atoms %d %d %d %d missing on proc %d at step %ld

The 4 atoms in a restrain dihedral specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Restrain atoms %d %d %d missing on proc %d at step %ld

The three atoms in a restrain angle specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Restrain atoms %d %d missing on proc %d at step %ld

The two atoms in a restrain bond specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Reuse of compute ID

A compute ID cannot be used twice.

Reuse of dump ID

A dump ID cannot be used twice.

Reuse of molecule template ID

The template IDs must be unique.

Reuse of region ID

A region ID cannot be used twice.

Rigid body atoms %d %d missing on proc %d at step %ld

This means that an atom cannot find the atom that owns the rigid body it is part of, or vice versa. The solution is to use the communicate cutoff command to ensure ghost atoms are acquired from far enough away to encompass the max distance printed when the fix rigid/small command was invoked.

Rigid fix must come before NPT/NPH fix

NPT/NPH fix must be defined in input script after all rigid fixes, else the rigid fix contribution to the pressure virial is incorrect.

Rmask function in equal-style variable formula

Rmask is per-atom operation.

Run command before simulation box is defined

The run command cannot be used before a read_data, read_restart, or create_box command.

Run_style command before simulation box is defined

The run_style command cannot be used before a read_data, read_restart, or create_box command.

SRD bin size for fix srd differs from user request

Fix SRD had to adjust the bin size to fit the simulation box. See the cubic keyword if you want this message to be an error vs warning.

SRD bins for fix srd are not cubic enough

The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

SRD particle %d started inside big particle %d on step %ld bounce %d

See the inside keyword if you want this message to be an error vs warning.

SRD particle %d started inside wall %d on step %ld bounce %d

See the inside keyword if you want this message to be an error vs warning.

Sending partition in processors part command is already a sender

Cannot specify a partition to be a sender twice.

Set command before simulation box is defined

The set command cannot be used before a read_data, read_restart, or create_box command.

Set command with no atoms existing

No atoms are yet defined so the set command cannot be used.

Set region ID does not exist

Region ID specified in set command does not exist.

Shake angles have different bond types

All 3-atom angle-constrained SHAKE clusters specified by the fix shake command that are the same angle type, must also have the same bond types for the two bonds in the angle.

Shake atoms %d %d %d %d missing on proc %d at step %ld

The 4 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake atoms %d %d %d missing on proc %d at step %ld

The three atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake atoms %d %d missing on proc %d at step %ld

The two atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake cluster of more than 4 atoms

A single cluster specified by the fix shake command can have no more than 4 atoms.

Shake clusters are connected

A single cluster specified by the fix shake command must have a single central atom with up to 3 other atoms bonded to it.

Shake determinant = 0.0

The determinant of the matrix being solved for a single cluster specified by the fix shake command is numerically invalid.

Shake fix must come before NPT/NPH fix

NPT fix must be defined in input script after SHAKE fix, else the SHAKE fix contribution to the pressure virial is incorrect.

Shear history overflow, boost neigh_modify one

There are too many neighbors of a single atom. Use the neigh_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

Small to big integers are not sized correctly

This error occurs when the sizes of smallint, imageint, tagint, bigint, as defined in src/lmptype.h are not what is expected. Contact the developers if this occurs.

Smallint setting in lmptype.h is invalid

It has to be the size of an integer.

Smallint setting in lmptype.h is not compatible

Smallint stored in restart file is not consistent with LAMMPS version you are running.

Special list size exceeded in fix bond/create

See the “read_data extra/special/per/atom” command (or the “create_box extra/special/per/atom” command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

Species XXX is not supported by this KIM Simulator Model

The kim_style define command was referencing a species that is not present in the requested KIM Simulator Model.

Specified processors != physical processors

The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

Subsequent read data induced too many angles per atom

See the extra/angle/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many bonds per atom

See the extra/bond/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many dihedrals per atom

See the extra/dihedral/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many improper per atom

See the extra/improper/per/atom keyword for the create_box or the read_data command to set this limit larger

Support for writing images in JPEG format not included

LAMMPS was not built with the -DLAMMPS_JPEG switch in the Makefile.

Support for writing images in PNG format not included

LAMMPS was not built with the -DLAMMPS_PNG switch in the Makefile.

Support for writing movies not included

LAMMPS was not built with the -DLAMMPS_FFMPEG switch in the Makefile

System in data file is too big

See the setting for bigint in the src/lmptype.h file.

System is not charge neutral, net charge = %g

The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is an error.

TIP4P hydrogen has incorrect atom type

The TIP4P pairwise computation found an H atom whose type does not agree with the specified H type.

TIP4P hydrogen is missing

The TIP4P pairwise computation failed to find the correct H atom within a water molecule.

TMD target file did not list all group atoms

The target file for the fix tmd command did not list all atoms in the fix group.

Tagint setting in lmptype.h is invalid

Tagint must be as large or larger than smallint.

Tagint setting in lmptype.h is not compatible

Format of tagint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Temper command before simulation box is defined

The temper command cannot be used before a read_data, read_restart, or create_box command.

Temperature compute degrees of freedom < 0

This should not happen if you are calculating the temperature on a valid set of atoms.

Temperature control must be used with fix nphug

The temp keyword must be provided.

Temperature for fix nvt/sllod does not have a bias

The specified compute must compute temperature with a bias.

Tempering could not find thermo_pe compute

This compute is created by the thermo command. It must have been explicitly deleted by a uncompute command.

Tempering fix ID is not defined

The fix ID specified by the temper command does not exist.

Tempering temperature fix is not valid

The fix specified by the temper command is not one that controls temperature (nvt or langevin).

Test_descriptor_string already allocated

This is an internal error. Contact the developers.

Thermo and fix not computed at compatible times

Fixes generate values on specific timesteps. The thermo output does not match these timesteps.

Thermo custom variable is not equal-style variable

Only equal-style variables can be output with thermodynamics, not atom-style variables.

Thermo every variable returned a bad timestep

The variable must return a timestep greater than the current timestep.

Thermo keyword in variable requires thermo to use/init pe

You are using a thermo keyword in a variable that requires potential energy to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo keyword in variable requires thermo to use/init press

You are using a thermo keyword in a variable that requires pressure to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo keyword in variable requires thermo to use/init temp

You are using a thermo keyword in a variable that requires temperature to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo style does not use press

Cannot use thermo_modify to set this parameter since the thermo_style is not computing this quantity.

Thermo style does not use temp

Cannot use thermo_modify to set this parameter since the thermo_style is not computing this quantity.

Thermo_modify every variable returned a bad timestep

The returned timestep is less than or equal to the current timestep.

Thermo_modify pressure ID does not compute pressure

The specified compute ID does not compute pressure.

Thermo_modify temperature ID does not compute temperature

The specified compute ID does not compute temperature.

Thermo_style command before simulation box is defined

The thermo_style command cannot be used before a read_data, read_restart, or create_box command.

This variable thermo keyword cannot be used between runs

Keywords that refer to time (such as cpu, elapsed) do not make sense in between runs.

Threshold for an atom property that is not allocated

A dump threshold has been requested on a quantity that is not defined by the atom style used in this simulation.

Timestep must be ≥ 0

Specified timestep is invalid.

Too big a problem to use velocity create loop all

The system size must fit in a 32-bit integer to use this option.

Too big a timestep for dump dcd

The timestep must fit in a 32-bit integer to use this dump style.

Too big a timestep for dump xtc

The timestep must fit in a 32-bit integer to use this dump style.

Too few bits for lookup table

Table size specified via pair_modify command does not work with your machine's floating point representation.

Too many -pk arguments in command-line

The string formed by concatenating the arguments is too long. Use a package command in the input script instead.

Too many MSM grid levels

The max number of MSM grid levels is hardwired to 10.

Too many args in variable function

More args are used than any variable function allows.

Too many atom pairs for pair bop

The number of atomic pairs exceeds the expected number. Check your atomic structure to ensure that it is realistic.

Too many atom sorting bins

This is likely due to an immense simulation box that has blown up to a large size.

Too many atom triplets for pair bop

The number of three atom groups for angle determinations exceeds the expected number. Check your atomic structure to ensure that it is realistic.

Too many atoms for dump dcd

The system size must fit in a 32-bit integer to use this dump style.

Too many atoms for dump xtc

The system size must fit in a 32-bit integer to use this dump style.

Too many elements extracted from MEAM library.

Increase 'maxelt' in meam.h and recompile.

Too many exponent bits for lookup table

Table size specified via pair_modify command does not work with your machine's floating point representation.

Too many groups

The maximum number of atom groups (including the "all" group) is given by MAX_GROUP in group.cpp and is 32.

Too many iterations

You must use a number of iterations that fit in a 32-bit integer for minimization.

Too many lines in one body in data file - boost MAXBODY

MAXBODY is a setting at the top of the src/read_data.cpp file. Set it larger and re-compile the code.

Too many local+ghost atoms for neighbor list

The number of nlocal + nghost atoms on a processor is limited by the size of a 32-bit integer with 2 bits removed for masking 1-2, 1-3, 1-4 neighbors.

Too many mantissa bits for lookup table

Table size specified via pair_modify command does not work with your machine's floating point representation.

Too many masses for fix shake

The fix shake command cannot list more masses than there are atom types.

Too many molecules for fix rigid

The limit is $2^{31} = \sim 2$ billion molecules.

Too many timesteps

The cumulative timesteps must fit in a 64-bit integer.

Too many timesteps for NEB

You must use a number of timesteps that fit in a 32-bit integer for NEB.

Too many total atoms

See the setting for bigint in the src/lmptype.h file.

Too many total bits for bitmapped lookup table

Table size specified via pair_modify command is too large. Note that a value of N generates a 2^N size table.

Too much buffered per-proc info for dump

The size of the buffered string must fit in a 32-bit integer for a dump.

Too much per-proc info for dump

Number of local atoms times number of columns must fit in a 32-bit integer for dump.

Topology type exceeds system topology type

The number of bond, angle, etc types exceeds the system setting. See the create_box or read_data command for how to specify these values.

Trying to build an occasional neighbor list before initialization completed

This is not allowed. Source code caller needs to be modified.

Two fix ave commands using same compute chunk/atom command in incompatible ways

They are both attempting to "lock" the chunk/atom command so that the chunk assignments persist for some number of timesteps, but are doing it in different ways.

The %s type label %s is already in use for type %s

For a given type-kind (atom types, bond types, etc.), a given type label can be assigned to only one numeric type.

Type label string %s for %s type %s is invalid

See the labelmap command documentation for valid type labels.

Unable to initialize accelerator for use

There was a problem initializing an accelerator for the gpu package

Unbalanced quotes in input line

No matching end double quote was found following a leading double quote.

Unexpected empty line in Angle Coeffs section

Read a blank line where there should be coefficient data.

Unexpected empty line in Bond Coeffs section

Read a blank line where there should be coefficient data.

Unexpected empty line in Dihedral Coeffs section

Read a blank line where there should be coefficient data.

Unexpected empty line in Improper Coeffs section

Read a blank line where there should be coefficient data.

Unexpected empty line in Pair Coeffs section

Read a blank line where there should be coefficient data.

Unexpected end of data file

LAMMPS hit the end of the data file while attempting to read a section. Something is wrong with the format of the data file.

Unexpected end of dump file

A read operation from the file failed.

Unexpected end of fix rigid file

A read operation from the file failed.

Unexpected end of fix rigid/small file

A read operation from the file failed.

Unexpected end of neb file

A read operation from the file failed.

Units command after simulation box is defined

The units command cannot be used after a read_data, read_restart, or create_box command.

Universe/uloop variable count < # of partitions

A universe or uloop style variable must specify a number of values $\geq$ to the number of processor partitions.

Unknown keyword in thermo_style custom command

One or more specified keywords are not recognized.

Unknown pair_modify hybrid sub-style

The choice of sub-style is unknown.

Unknown table style in pair_style command

Style of table is invalid for use with pair_style table command.

Unrecognized lattice type in MEAM library file

The lattice type in an entry of the MEAM library file is not valid.

Unrecognized lattice type in MEAM parameter file

The lattice type in an entry of the MEAM parameter file is not valid.

Unsupported mixing rule in kspace_style ewald/disp

Only geometric mixing is supported.

Unsupported order in kspace_style ewald/disp

Only $1/r^6$ dispersion or dipole terms are supported.

Unsupported order in kspace_style pppm/disp, pair_style %s

Only pair styles with $1/r$ and $1/r^6$ dependence are currently supported.

Use cutoff keyword to set cutoff in single mode

Mode is single so cutoff/multi keyword cannot be used.

Use cutoff/multi keyword to set cutoff in multi mode

Mode is multi so cutoff keyword cannot be used.

Using fix nvt/sllod with inconsistent fix deform remap option

Fix nvt/sllod requires that deforming atoms have a velocity profile provided by “remap v” as a fix deform option.

Using fix srd with inconsistent fix deform remap option

When shearing the box in an SRD simulation, the remap v option for fix deform needs to be used.

Using pair lubricate with inconsistent fix deform remap option

Must use remap v option with fix deform with this pair style.

Using pair lubricate/poly with inconsistent fix deform remap option

If fix deform is used, the remap v option is required.

Variable atom ID is too large

Specified ID is larger than the maximum allowed atom ID.

Variable evaluation before simulation box is defined

Cannot evaluate a compute or fix or atom-based value in a variable before the simulation has been setup.

Variable evaluation in fix wall gave bad value

The returned value for epsilon or sigma < 0.0.

Variable evaluation in region gave bad value

Variable returned a radius < 0.0.

Variable for create_atoms is invalid style

The variables must be equal-style variables.

Variable for displace_atoms is invalid style

It must be an equal-style or atom-style variable.

Variable for dump every is invalid style

Only equal-style variables can be used.

Variable for dump image center is invalid style

Must be an equal-style variable.

Variable for dump image phi is invalid style

Must be an equal-style variable.

Variable for dump image theta is invalid style

Must be an equal-style variable.

Variable for dump image zoom is invalid style

Must be an equal-style variable.

Variable for fix adapt is invalid style

Only equal-style variables can be used.

Variable for fix aveforce is invalid style

Only equal-style variables can be used.

Variable for fix deform is invalid style

The variable must be an equal-style variable.

Variable for fix efield is invalid style

The variable must be an equal- or atom-style variable.

Variable for fix gravity is invalid style

Only equal-style variables can be used.

Variable for fix heat is invalid style

Only equal-style or atom-style variables can be used.

Variable for fix indent is invalid style

Only equal-style variables can be used.

Variable for fix indent is not equal style

Only equal-style variables can be used.

Variable for fix langevin is invalid style

It must be an equal-style variable.

Variable for fix move is invalid style

Only equal-style variables can be used.

Variable for fix setforce is invalid style

Only equal-style variables can be used.

Variable for fix temp/berendsen is invalid style

Only equal-style variables can be used.

Variable for fix temp/csld is invalid style

Only equal-style variables can be used.

Variable for fix temp/csvr is invalid style

Only equal-style variables can be used.

Variable for fix temp/rescale is invalid style

Only equal-style variables can be used.

Variable for fix wall is invalid style

Only equal-style variables can be used.

Variable for fix wall/reflect is invalid style

Only equal-style variables can be used.

Variable for fix wall/srd is invalid style

Only equal-style variables can be used.

Variable for group dynamic is invalid style

The variable must be an atom-style variable.

Variable for group is invalid style

Only atom-style variables can be used.

Variable for region cylinder is invalid style

Only equal-style variables are allowed.

Variable for region is invalid style

Only equal-style variables can be used.

Variable for region sphere is invalid style

Only equal-style variables are allowed.

Variable for restart is invalid style

Only equal-style variables can be used.

Variable for set command is invalid style

Only atom-style variables can be used.

Variable for thermo every is invalid style

Only equal-style variables can be used.

Variable for velocity set is invalid style

Only atom-style variables can be used.

Variable has circular dependency

A circular dependency is when variable “a” is used by variable “b” and variable “b” is also used by variable “a”. Circular dependencies with longer chains of dependence are also not allowed.

Velocity command before simulation box is defined

The velocity command cannot be used before a read_data, read_restart, or create_box command.

Velocity command with no atoms existing

A velocity command has been used, but no atoms yet exist.

Velocity temperature ID does calculate a velocity bias

The specified compute must compute a bias for temperature.

Velocity temperature ID does not compute temperature

The compute ID given to the velocity command must compute temperature.

Verlet/split can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

Verlet/split does not yet support TIP4P

This is a current limitation.

Verlet/split requires 2 partitions

See the -partition command-line switch.

Verlet/split requires Rspace partition layout be multiple of Kspace partition layout in each dim

This is controlled by the processors command.

Verlet/split requires Rspace partition size be multiple of Kspace partition size

This is so there is an equal number of Rspace processors for every Kspace processor.

Voro++ error: narea and neigh have a different size

This error is returned by the Voro++ library.

Water H epsilon must be 0.0 for pair style lj/cut/tip4p/cut

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

Water H epsilon must be 0.0 for pair style lj/cut/tip4p/long

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

Water H epsilon must be 0.0 for pair style lj/long/tip4p/long

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

World variable count does not match # of partitions

A world-style variable must specify a number of values equal to the number of processor partitions.

Write_restart command before simulation box is defined

The write_restart command cannot be used before a read_data, read_restart, or create_box command.

5.7 Warning messages

This is an alphabetic list of some of the WARNING messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. This is a historic list and no longer updated. Instead the LAMMPS developers are trying to provide more details right with the error message or link to a paragraph with [detailed explanations](#).

Warning messages also list the source file and line number where the warning was generated. For example, a message like this:

WARNING: Bond atom missing in box size check (domain.cpp:187)

means that line #187 in the file src/domain.cpp generated the error. Looking in the source code may help you figure out what went wrong.

Please also see the page with [Error messages](#)

Adjusting Coulombic cutoff for MSM, new cutoff = %g

The adjust/cutoff command is turned on and the Coulombic cutoff has been adjusted to match the user-specified accuracy.

Angle atoms missing at step %ld

One or more of three atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

Angles are defined but no angle style is set

The topology contains angles, but there are no angle forces computed since there was no `angle_style` command.

Bond atom missing in box size check

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in image check

The second atom in a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atoms missing at step %ld

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bonds are defined but no bond style is set

The topology contains bonds, but there are no bond forces computed since there was no `bond_style` command.

Bond/angle/dihedral extent > half of periodic box length

This is a restriction because LAMMPS can be confused about which image of an atom in the bonded interaction is the correct one to use. “Extent” in this context means the maximum end-to-end length of the bond/angle/dihedral. LAMMPS computes this by taking the maximum bond length, multiplying by the number of bonds in the interaction (e.g. 3 for a dihedral) and adding a small amount of stretch.

Calling write_dump before a full system init.

The `write_dump` command is used before the system has been fully initialized as part of a ‘run’ or ‘minimize’ command. Not all dump styles and features are fully supported at this point and thus the command may fail or produce incomplete or incorrect output. Insert a “run 0” command, if a full system init is required.

Cannot count rigid body degrees-of-freedom before bodies are fully initialized

This means the temperature associated with the rigid bodies may be incorrect on this timestep.

Cannot count rigid body degrees-of-freedom before bodies are initialized

This means the temperature associated with the rigid bodies may be incorrect on this timestep.

Communication cutoff is 0.0. No ghost atoms will be generated. Atoms may get lost

The communication cutoff defaults to the maximum of what is inferred from pair and bond styles (will be zero, if none are defined) and what is specified via `comm_modify cutoff` (defaults to 0.0). If this results to 0.0, no ghost atoms will be generated and LAMMPS may lose atoms or use incorrect periodic images of atoms in interaction lists. To avoid, either use `pair style zero` with a suitable cutoff or use `comm_modify cutoff`.

Communication cutoff is shorter than a bond length based estimate. This may lead to errors.

Since LAMMPS stores topology data with individual atoms, all atoms comprising a bond, angle, dihedral or improper must be present on any subdomain that “owns” the atom with the information, either as a local or a ghost atom. The communication cutoff is what determines up to what distance from a subdomain boundary ghost atoms are created. The communication cutoff is by default the largest non-bonded cutoff plus the neighbor skin distance, but for short or non-bonded cutoffs and/or long bonds, this may not be sufficient. This warning indicates that there is an increased risk of a simulation stopping unexpectedly because of Bond/Angle/Dihedral/Improper atoms missing. It can be silenced by manually setting the communication cutoff via `comm_modify cutoff`. However, since the heuristic used to determine the estimate is not always accurate, it is not changed automatically and the warning may be ignored depending on the specific system being simulated.

Compute cna/atom cutoff may be too large to find ghost atom neighbors

The neighbor cutoff used may not encompass enough ghost atoms to perform this operation correctly.

Computing temperature of portions of rigid bodies

The group defined by the temperature compute does not encompass all the atoms in one or more rigid bodies, so the change in degrees-of-freedom for the atoms in those partial rigid bodies will not be accounted for.

Create_bonds max distance > minimum neighbor cutoff

This means atom pairs for some atom types may not be in the neighbor list and thus no bond can be created between them.

Delete_atoms cutoff > minimum neighbor cutoff

This means atom pairs for some atom types may not be in the neighbor list and thus an atom in that pair cannot be deleted.

Dihedral atoms missing at step %ld

One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

Dihedral problem

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Dihedral problem: %d %ld %d %d %d %d

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Dihedrals are defined but no dihedral style is set

The topology contains dihedrals, but there are no dihedral forces computed since there was no dihedral_style command.

Dump dcd/xtc timestamp may be wrong with fix dt/reset

If the fix changes the timestep, the dump dcd file will not reflect the change.

Energy due to X extra global DOFs will be included in minimizer energies

When using fixes like box/relax, the potential energy used by the minimizer is augmented by an additional energy provided by the fix. Thus the printed converged energy may be different from the total potential energy.

Estimated error in splitting of dispersion coeffs is %g

Error is greater than 0.0001 percent.

FENE bond too long

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

FENE bond too long: %ld %d %d %g

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

FENE bond too long: %ld %g

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

Fix SRD walls overlap but fix srd overlap not set

You likely want to set this in your input script.

Fix bond/create is used multiple times or with fix bond/break - may not work as expected

When using fix bond/create multiple times or in combination with fix bond/break, the individual fix instances do not share information about changes they made at the same time step and thus it may result in unexpected behavior.

Fix bond/react: Atom affected by reaction too close to template edge

This means an atom which changes type or connectivity during the reaction is too close to an 'edge' atom defined in the superimpose file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

Fix bond/swap will ignore defined angles

See the page for fix bond/swap for more info on this restriction.

Fix deposit near setting < possible overlap separation %g

This test is performed for finite size particles with a diameter, not for point particles. The near setting is smaller than the particle diameter which can lead to overlaps.

Fix evaporate may delete atom with non-zero molecule ID

This is probably an error, since you should not delete only one atom of a molecule.

Fix gcmc using full_energy option

Fix gcmc has automatically turned on the full_energy option since it is required for systems like the one specified by the user. User input included one or more of the following: kspace, triclinic, a hybrid pair style, an eam pair style, or no “single” function for the pair style.

Fix langevin gif using random gaussians is not implemented with kokkos

This will most likely cause errors in kinetic fluctuations.

Fix property/atom mol or charge w/out ghost communication

A model typically needs these properties defined for ghost atoms.

Fix qeq has non-zero lower Taper radius cutoff

Absolute value must be ≤ 0.01 .

Fix qeq has very low Taper radius cutoff

Value should typically be ≥ 5.0 .

Fix rattle should come after all other integration fixes

This fix is designed to work after all other integration fixes change atom positions. Thus it should be the last integration fix specified. If not, it will not satisfy the desired constraints as well as it otherwise would.

Fix recenter should come after all other integration fixes

Other fixes may change the position of the center-of-mass, so fix recenter should come last.

Fix srd SRD moves may trigger frequent reneighboring

This is because the SRD particles may move long distances.

Fix srd grid size > 1/4 of big particle diameter

This may cause accuracy problems.

Fix srd particle moved outside valid domain

This may indicate a problem with your simulation parameters.

Fix srd particles may move > big particle diameter

This may cause accuracy problems.

Fix srd viscosity < 0.0 due to low SRD density

This may cause accuracy problems.

Fixes cannot send data in Kokkos communication, switching to classic communication

This is current restriction with Kokkos.

For better accuracy use ‘pair_modify table 0’

The user-specified force accuracy cannot be achieved unless the table feature is disabled by using ‘pair_modify table 0’.

Group for fix_modify temp != fix group

The fix_modify command is specifying a temperature computation that computes a temperature on a different group of atoms than the fix itself operates on. This is probably not what you want to do.

H matrix size has been exceeded: m_fill=%d H.m=%dn

This is the size of the matrix.

Ignoring unknown or incorrect info command flag

Self-explanatory. An unknown argument was given to the info command. Compare your input with the documentation.

Improper atoms missing at step %ld

One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

Improper problem: %d %ld %d %d %d %d

Conformation of the 4 listed improper atoms is extreme; you may want to check your simulation geometry.

Impropers are defined but no improper style is set

The topology contains impropers, but there are no improper forces computed since there was no improper_style command.

Increasing communication cutoff for GPU style

The pair style has increased the communication cutoff to be consistent with the communication cutoff requirements for this pair style when run on the GPU.

Kspace_modify slab param < 2.0 may cause unphysical behavior

The kspace_modify slab parameter should be larger to ensure periodic grids padded with empty space do not overlap.

Less insertions than requested

The fix pour command was unsuccessful at finding open space for as many particles as it tried to insert.

Library error in lammmps_gather_atoms

This library function cannot be used if atom IDs are not defined or are not consecutively numbered.

Library error in lammmps_scatter_atoms

This library function cannot be used if atom IDs are not defined or are not consecutively numbered, or if no atom map is defined. See the atom_modify command for details about atom maps.

Likewise 1-2 special neighbor interactions != 1.0

The topology contains bonds, but there is no bond style defined and a 1-2 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the bond style.

Likewise 1-3 special neighbor interactions != 1.0

The topology contains angles, but there is no angle style defined and a 1-3 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the angle style.

Likewise 1-4 special neighbor interactions != 1.0

The topology contains dihedrals, but there is no dihedral style defined and a 1-4 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the dihedral style.

Lost atoms via change_box: original %ld current %ld

The command options you have used caused atoms to be lost.

Lost atoms via displace_atoms: original %ld current %ld

The command options you have used caused atoms to be lost.

Lost atoms: original %ld current %ld

Lost atoms are checked for each time thermo output is done. See the thermo_modify lost command for options. Lost atoms usually indicate bad dynamics, e.g. atoms have been blown far out of the simulation box, or moved further than one processor's subdomain away before reneighboring.

Mismatch between velocity and compute groups

The temperature computation used by the velocity command will not be on the same group of atoms that velocities

are being set for.

Molecule has bond topology but no special bond settings

This means the bonded atoms will not be excluded in pairwise interactions.

Molecule template for create_atoms has multiple molecules

The create_atoms command will only create molecules of a single type, i.e. the first molecule in the template.

Molecule template for fix gcmc has multiple molecules

The fix gcmc command will only create molecules of a single type, i.e. the first molecule in the template.

Molecule template for fix shake has multiple molecules

The fix shake command will only recognize molecules of a single type, i.e. the first molecule in the template.

More than one compute centro/atom

It is not efficient to use compute centro/atom more than once.

More than one compute cluster/atom

It is not efficient to use compute cluster/atom more than once.

More than one compute cna/atom defined

It is not efficient to use compute cna/atom more than once.

More than one compute contact/atom

It is not efficient to use compute contact/atom more than once.

More than one compute coord/atom

It is not efficient to use compute coord/atom more than once.

More than one compute damage/atom

It is not efficient to use compute ke/atom more than once.

More than one compute erotate/sphere/atom

It is not efficient to use compute erotate/sphere/atom more than once.

More than one compute hexorder/atom

It is not efficient to use compute hexorder/atom more than once.

More than one compute ke/atom

It is not efficient to use compute ke/atom more than once.

More than one compute orientorder/atom

It is not efficient to use compute orientorder/atom more than once.

More than one fix rigid

It is not efficient to use fix rigid more than once.

Neighbor exclusions used with KSpace solver may give inconsistent Coulombic energies

This is because excluding specific pair interactions also excludes them from long-range interactions which may not be the desired effect. The special_bonds command handles this consistently by ensuring excluded (or weighted) 1-2, 1-3, 1-4 interactions are treated consistently by both the short-range pair style and the long-range solver. This is not done for exclusions of charged atom pairs via the neigh_modify exclude command.

New thermo_style command, previous thermo_modify settings will be lost

If a thermo_style command is used after a thermo_modify command, the settings changed by the thermo_modify command will be reset to their default values. This is because the thermo_modify command acts on the currently defined thermo style, and a thermo_style command creates a new style.

No Kspace calculation with verlet/split

The second partition performs a kspace calculation so the kspace_style command must be used.

No automatic unit conversion to XTC file format conventions possible for units lj

This means no scaling will be performed.

No fixes defined, atoms won't move

If you are not using a fix like nve, nvt, npt then atom velocities and coordinates will not be updated during timestepping.

Not using real units with pair reaxff

This is most likely an error, unless you have created your own ReaxFF parameter file in a different set of units.

Number of MSM mesh points changed to be a multiple of 2

MSM requires that the number of grid points in each direction be a multiple of two and the number of grid points in one or more directions have been adjusted to meet this requirement.

OMP_NUM_THREADS environment is not set.

This environment variable must be set appropriately to use the OPENMP package.

One or more atoms are time integrated more than once

This is probably an error since you typically do not want to advance the positions or velocities of an atom more than once per timestep.

One or more chunks do not contain all atoms in molecule

This may not be what you intended.

One or more dynamic groups may not be updated at correct point in timestep

If there are other fixes that act immediately after the initial stage of time integration within a timestep (i.e. after atoms move), then the command that sets up the dynamic group should appear after those fixes. This will ensure that dynamic group assignments are made after all atoms have moved.

One or more respa levels compute no forces

This is computationally inefficient.

Pair COMB charge %.10f with force %.10f hit max barrier

Something is possibly wrong with your model.

Pair COMB charge %.10f with force %.10f hit min barrier

Something is possibly wrong with your model.

Pair dsmc: num_of_collisions > number_of_A

Collision model in DSMC is breaking down.

Pair dsmc: num_of_collisions > number_of_B

Collision model in DSMC is breaking down.

Pair style restartinfo set but has no restart support

This pair style has a bug, where it does not support reading and writing information to a restart file, but does not set the member variable "restartinfo" to 0 as required in that case.

Particle deposition was unsuccessful

The fix deposit command was not able to insert as many atoms as needed. The requested volume fraction may be too high, or other atoms may be in the insertion region.

Proc subdomain size < neighbor skin, could lead to lost atoms

The decomposition of the physical domain (likely due to load balancing) has led to a processor's subdomain being smaller than the neighbor skin in one or more dimensions. Since reneighboring is triggered by atoms moving the skin distance, this may lead to lost atoms, if an atom moves all the way across a neighboring processor's subdomain before reneighboring is triggered.

Reducing PPPM order b/c stencil extends beyond nearest neighbor processor

This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

Reducing PPPMDisp Coulomb order b/c stencil extends beyond neighbor processor

This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

Reducing PPPMDisp dispersion order b/c stencil extends beyond neighbor processor

This may lead to a larger grid than desired. See the `kpspace_modify overlap` command to prevent changing of the PPPM order.

Replacing a fix, but new group != old group

The ID and style of a fix match for a fix you are changing with a fix command, but the new group you are specifying does not match the old group.

Replicating in a non-periodic dimension

The parameters for a replicate command will cause a non-periodic dimension to be replicated; this may cause unwanted behavior.

Resetting reneighboring criteria during PRD

A PRD simulation requires that `neigh_modify` settings be `delay = 0`, `every = 1`, `check = yes`. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

Resetting reneighboring criteria during TAD

A TAD simulation requires that `neigh_modify` settings be `delay = 0`, `every = 1`, `check = yes`. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

Resetting reneighboring criteria during minimization

Minimization requires that `neigh_modify` settings be `delay = 0`, `every = 1`, `check = yes`. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the minimization.

Restart file used different # of processors

The restart file was written out by a LAMMPS simulation running on a different number of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

Restart file used different 3d processor grid

The restart file was written out by a LAMMPS simulation running on a different 3d grid of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

Restart file used different boundary settings, using restart file values

Your input script cannot change these restart file settings.

Restart file used different newton bond setting, using restart file value

The restart file value will override the setting in the input script.

Restart file used different newton pair setting, using input script value

The input script value will override the setting in the restart file.

Restrain problem: %d %ld %d %d %d %d

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Running PRD with only one replica

This is allowed, but you will get no parallel speed-up.

SRD bin shifting turned on due to small lamda

This is done to try to preserve accuracy.

SRD bin size for fix srd differs from user request

Fix SRD had to adjust the bin size to fit the simulation box. See the `cubic` keyword if you want this message to be an error vs warning.

SRD bins for fix srd are not cubic enough

The bin shape is not within tolerance of cubic. See the `cubic` keyword if you want this message to be an error vs warning.

SRD particle %d started inside big particle %d on step %ld bounce %d

See the `inside` keyword if you want this message to be an error vs warning.

SRD particle %d started inside wall %d on step %ld bounce %d

See the inside keyword if you want this message to be an error vs warning.

Shake determinant < 0.0

The determinant of the quadratic equation being solved for a single cluster specified by the fix shake command is numerically suspect. LAMMPS will set it to 0.0 and continue.

Shell command returned with non-zero status

This may indicate the shell command did not operate as expected.

Should not allow rigid bodies to bounce off reflecting walls

LAMMPS allows this, but their dynamics are not computed correctly.

Should not use fix nve/limit with fix shake or fix rattle

This will lead to invalid constraint forces in the SHAKE/RATTLE computation.

Slab correction not needed for MSM

Slab correction is intended to be used with Ewald or PPPM and is not needed by MSM.

System is not charge neutral, net charge = %g

The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is only a warning.

Table inner cutoff >= outer cutoff

You specified an inner cutoff for a Coulombic table that is longer than the global cutoff. Probably not what you wanted.

Temperature for MSST is not for group all

User-assigned temperature to MSST fix does not compute temperature for all atoms. Since MSST computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by MSST could be inaccurate.

Temperature for NPT is not for group all

User-assigned temperature to NPT fix does not compute temperature for all atoms. Since NPT computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by NPT could be inaccurate.

Temperature for fix modify is not for group all

The temperature compute is being used with a pressure calculation which does operate on group all, so this may be inconsistent.

Temperature for thermo pressure is not for group all

User-assigned temperature to thermo via the thermo_modify command does not compute temperature for all atoms. Since thermo computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure printed by thermo could be inaccurate.

The minimizer does not re-orient dipoles when using fix efield

This means that only the atom coordinates will be minimized, not the orientation of the dipoles.

Too many common neighbors in CNA %d times

More than the maximum # of neighbors was found multiple times. This was unexpected.

Too many neighbors in CNA for %d atoms

More than the maximum # of neighbors was found multiple times. This was unexpected.

Use special bonds = 0,1,1 with bond style fene

Most FENE models need this setting for the special_bonds command.

Use special bonds = 0,1,1 with bond style fene/expand

Most FENE models need this setting for the special_bonds command.

Using a many-body potential with bonds/angles/dihedrals and special_bond exclusions

This is likely not what you want to do. The exclusion settings will eliminate neighbors in the neighbor list, which the many-body potential needs to calculate its terms correctly.

Using compute temp/deform with inconsistent fix deform remap option

Fix nvt/sllod assumes deforming atoms have a velocity profile provided by “remap v” or “remap none” as a fix deform option.

Using compute temp/deform with no fix deform defined

This is probably an error, since it makes little sense to use compute temp/deform in this case.

Using fix srd with box deformation but no SRD thermostat

The deformation will heat the SRD particles so this can be dangerous.

Using pair potential shift with pair_modify compute no

The shift effects will thus not be computed.

Using pair tail corrections with nonperiodic system

This is probably a bogus thing to do, since tail corrections are computed by integrating the density of a periodic system out to infinity.

Using pair tail corrections with pair_modify compute no

The tail corrections will thus not be computed.

COMMANDS

These pages describe how a LAMMPS input script is formatted and the commands in it are used to define a LAMMPS simulation.

6.1 LAMMPS input scripts

LAMMPS executes calculations by reading commands from an input script (text file), one line at a time. When the input script ends, LAMMPS exits. This is different from programs that read and process the entire input before starting a calculation.

Each command causes LAMMPS to take some immediate action without regard for any commands that may be processed later. Commands may set an internal variable, read in a file, or run a simulation. These actions can be grouped into three categories:

- a) commands that change a global setting (examples: *timestep*, *newton*, *echo*, *log*, *thermo*, *restart*),
- b) commands that add, modify, remove, or replace “styles” that are executed during a “run” (examples: *pair_style*, *fix*, *compute*, *dump*, *thermo_style*, *pair_modify*), and
- c) commands that execute a “run” or perform some other computation or operation (examples: *print*, *run*, *minimize*, *temper*, *write_dump*, *rerun*, *read_data*, *read_restart*)

Commands in category a) have default settings, which means you only need to use the command if you wish to change the defaults.

In many cases, the ordering of commands in an input script is not important, but can have consequences when the global state is changed between commands in the c) category. The following rules apply:

- (1) LAMMPS does not read your entire input script and then perform a simulation with all the settings. Rather, the input script is read one line at a time and each command takes effect when it is read. Thus this sequence of commands:

```
timestep 0.5
run      100
run      100
```

does something different than this sequence:

```
run      100
timestep 0.5
run      100
```

In the first case, the specified timestep (0.5 fs) is used for two simulations of 100 timesteps each. In the second case, the default timestep (1.0 fs) is used for the first 100 step simulation and a 0.5 fs timestep is used for the second one.

- (2) Some commands are only valid when they follow other commands. For example you cannot set the temperature of a group of atoms until atoms have been defined and a group command is used to define which atoms belong to the group.
- (3) Sometimes command B will use values that can be set by command A. This means command A must precede command B in the input script if it is to have the desired effect. For example, the [read_data](#) command initializes the system by setting up the simulation box and assigning atoms to processors. If default values are not desired, the [processors](#) and [boundary](#) commands need to be used before [read_data](#) to tell LAMMPS how to map processors to the simulation box.

Many input script errors are detected by LAMMPS and an ERROR or WARNING message is printed. The [Errors](#) page gives more information on what errors mean. The documentation for each command lists restrictions on how the command can be used.

You can use the [-skiprun](#) command-line flag to have LAMMPS skip the execution of any [run](#), [minimize](#), or similar commands to check the entire input for correct syntax to avoid crashes on typos or syntax errors in long runs.

6.2 Parsing rules for input scripts

Each non-blank line in the input script is treated as a command. LAMMPS commands are case sensitive. Command names are lower-case, as are specified command arguments. Upper case letters may be used in file names or user-chosen ID strings.

Here are 6 rules for how each line in the input script is parsed by LAMMPS:

1. If the last printable character on the line is a “&” character, the command is assumed to continue on the next line. The next line is concatenated to the previous line by removing the “&” character and line break. This allows long commands to be continued across two or more lines. See the discussion of triple quotes in [6](#) for how to continue a command across multiple line without using “&” characters.
2. All characters from the first “#” character onward are treated as comment and discarded. The exception to this rule is described in [6](#). Note that a comment after a trailing “&” character will prevent the command from continuing on the next line. Also note that for multi-line commands a single leading “#” will comment out the entire command.

```
# this is a comment
timestep 1.0 # this is also a comment
```

3. The line is searched repeatedly for \$ characters, which indicate variables that are replaced with a text string. The exception to this rule is described in [6](#).

If the \$ is followed by text in curly brackets ‘{}’, then the variable name is the text inside the curly brackets. If no curly brackets follow the \$, then the variable name is the single character immediately following the \$. Thus `${myTemp}` and `$x` refer to variables named “myTemp” and “x”, while `$xx` will be interpreted as a variable named “x” followed by an “x” character.

How the variable is converted to a text string depends on what style of variable it is; see the [variable](#) page for details. It can be a variable that stores multiple text strings, and return one of them. The returned text string can be multiple “words” (space separated) which will then be interpreted as multiple arguments in the input command. The variable can also store a numeric formula which will be evaluated and its numeric result returned as a string.

As a special case, if the \$ is followed by parenthesis “()”, then the text inside the parenthesis is treated as an “immediate” variable and evaluated as an [equal-style variable](#). This is a way to use numeric formulas in an input script without having to assign them to variable names. For example, these 3 input script lines:

```
variable X equal (xlo+xhi)/2+sqrt(v_area)
region 1 block $X 2 INF INF EDGE EDGE
variable X delete
```

can be replaced by:

```
region 1 block $((xlo+xhi)/2+sqrt(v_area)) 2 INF INF EDGE EDGE
```

so that you do not have to define (or discard) a temporary variable, “X” in this case.

Additionally, the entire “immediate” variable expression may be followed by a colon, followed by a C-style format string, e.g. `:%f` or `:%.10g`. The format string must be appropriate for a double-precision floating-point value. The format string is used to output the result of the variable expression evaluation. If a format string is not specified, a high-precision `%.20g` is used as the default format.

This can be useful for formatting print output to a desired precision:

```
print "Final energy per atom: $(v_ke_per_atom+v_pe_per_atom:%10.3f) eV/atom"
```

Note that neither the curly-bracket or immediate form of variables can contain nested `$` characters for other variables to substitute for. Thus you may **NOT** do this:

```
variable a equal 2
variable b2 equal 4
print "B2 = ${b$a}"
```

Nor can you specify an expression like `$(x-1.0)` for an immediate variable, but you could use `$(v_x-1.0)`, since the latter is valid syntax for an *equal-style variable*.

See the *variable* command for more details of how strings are assigned to variables and evaluated, and how they can be used in input script commands.

4. The line is broken into “words” separated by white-space (tabs, spaces). Note that words can thus contain letters, digits, underscores, or punctuation characters.
5. The first word is the command name. All successive words in the line are arguments.
6. If you want text with spaces to be treated as a single argument, it can be enclosed in either single (') or double (") or triple (""") quotes. A long single argument enclosed in single or double quotes can span multiple lines if the “&” character is used, as described in [1](#) above. When the lines are concatenated together by LAMMPS (and the “&” characters and line breaks removed), the combined text will become a single line. If you want multiple lines of an argument to retain their line breaks, the text can be enclosed in triple quotes, in which case “&” characters are not needed and do not function as line continuation character. For example:

```
print "Volume = $v"
print 'Volume = $v'
if "${steps} > 1000" then quit
variable a string "red green blue &
                  purple orange cyan"
print """"
System volume = $v
System temperature = $t
""""
```

In each of these cases, the single, double, or triple quotes are removed and the enclosed text stored internally as a single argument.

See the *dump modify format*, *print*, *if*, and *python* commands for examples.

A “#” or “\$” character that is between quotes will not be treated as a comment indicator in 2 or substituted for as a variable in 3.

Note

If the argument is itself a command that requires a quoted argument (e.g. using a *print* command as part of an *if* or *run every* command), then single, double, or triple quotes can be nested in the usual manner. See the doc pages for those commands for examples. Only one level of nesting is allowed, but that should be sufficient for most use cases.

ASCII versus UTF-8

LAMMPS expects and processes 7-bit ASCII format text internally. Many modern environments use UTF-8 encoding, which is a superset of the 7-bit ASCII character table and thus mostly compatible. However, there are several non-ASCII characters that can look very similar to their ASCII equivalents or are invisible (so they look like a blank), but are encoded differently. Web browsers, PDF viewers, document editors are known to sometimes replace one with the other for a better looking output. However, that can lead to problems, for instance, when using cut-n-paste of input file examples from web pages, or when using a document editor (not a dedicated plain text editor) for writing LAMMPS inputs. LAMMPS will try to detect this and substitute the non-ASCII characters with their ASCII equivalents where known. There also is going to be a warning printed, if this occurs. It is recommended to avoid such characters altogether in LAMMPS input, data and potential files. The replacement tables are likely incomplete and dependent on users reporting problems processing correctly looking input containing UTF-8 encoded non-ASCII characters.

6.3 Input script structure

This page describes the structure of a typical LAMMPS input script. The examples directory in the LAMMPS distribution contains many sample input scripts; it is discussed on the *Examples* doc page.

A LAMMPS input script typically has 4 parts:

1. *Initialization*
2. *System definition*
3. *Simulation settings*
4. *Run a simulation*

The last 2 parts can be repeated as many times as desired. I.e. run a simulation, change some settings, run some more, etc. Each of the 4 parts is now described in more detail. Remember that almost all commands need only be used if a non-default value is desired.

6.3.1 Initialization

Set parameters that need to be defined before atoms are created or read-in from a file.

The relevant commands are *units*, *dimension*, *newton*, *processors*, *boundary*, *atom_style*, *atom_modify*.

If force-field parameters appear in the files that will be read, these commands tell LAMMPS what kinds of force fields are being used: *pair_style*, *bond_style*, *angle_style*, *dihedral_style*, *improper_style*.

6.3.2 System definition

There are 3 ways to define the simulation cell and reserve space for force field info and fill it with atoms in LAMMPS. Read them in from (1) a data file or (2) a restart file via the *read_data* or *read_restart* commands, respectively. These files can also contain molecular topology information. Or (3) create a simulation cell and fill it with atoms on a lattice (with no molecular topology), using these commands: *lattice*, *region*, *create_box*, *create_atoms* or *read_dump*.

The entire set of atoms can be duplicated to make a larger simulation using the *replicate* command.

6.3.3 Simulation settings

Once atoms and molecular topology are defined, a variety of settings can be specified: force field coefficients, simulation parameters, output options, and more.

Force field coefficients are set by these commands (they can also be set in the read-in files): *pair_coeff*, *bond_coeff*, *angle_coeff*, *dihedral_coeff*, *improper_coeff*, *kspace_style*, *dielectric*, *special_bonds*.

Various simulation parameters are set by these commands: *neighbor*, *neigh_modify*, *group*, *timestep*, *reset_timestep*, *run_style*, *min_style*, *min_modify*.

Fixes impose a variety of boundary conditions, time integration, and diagnostic options. The *fix* command comes in many flavors.

Various computations can be specified for execution during a simulation using the *compute*, *compute_modify*, and *variable* commands.

Output options are set by the *thermo*, *dump*, and *restart* commands.

6.3.4 Run a simulation

A molecular dynamics simulation is run using the *run* command. Energy minimization (molecular statics) is performed using the *minimize* command. A parallel tempering (replica-exchange) simulation can be run using the *temper* command.

6.4 Commands by category

This page lists most of the LAMMPS commands, grouped by category. The *General commands* page lists all general commands alphabetically. Style options for entries like fix, compute, pair etc. have their own pages where they are listed alphabetically.

6.4.1 Initialization

<i>newton</i>	<i>package</i>	<i>processors</i>	<i>suffix</i>	<i>units</i>
---------------	----------------	-------------------	---------------	--------------

6.4.2 Setup simulation box

<i>boundary</i>	<i>change_box</i>	<i>create_box</i>	<i>dimension</i>
<i>lattice</i>	<i>region</i>		

6.4.3 Setup atoms

<i>atom_modify</i>	<i>atom_style</i>	<i>balance</i>	<i>create_atoms</i>
<i>create_bonds</i>	<i>delete_atoms</i>	<i>delete_bonds</i>	<i>displace_atoms</i>
<i>group</i>	<i>mass</i>	<i>molecule</i>	<i>read_data</i>
<i>read_dump</i>	<i>read_restart</i>	<i>replicate</i>	<i>set</i>
<i>velocity</i>			

6.4.4 Force fields

<i>angle_coeff</i>	<i>angle_style</i>	<i>bond_coeff</i>	<i>bond_style</i>
<i>bond_write</i>	<i>dielectric</i>	<i>dihedral_coeff</i>	<i>dihedral_style</i>
<i>improper_coeff</i>	<i>improper_style</i>	<i>kspace_modify</i>	<i>kspace_style</i>
<i>pair_coeff</i>	<i>pair_modify</i>	<i>pair_style</i>	<i>pair_write</i>
<i>special_bonds</i>			

6.4.5 Settings

<i>comm_modify</i>	<i>comm_style</i>	<i>info</i>	<i>min_modify</i>
<i>min_style</i>	<i>neigh_modify</i>	<i>neighbor</i>	<i>partition</i>
<i>reset_timestep</i>	<i>run_style</i>	<i>timer</i>	<i>timestep</i>

6.4.6 Operations within timestepping (fixes) and diagnostics (computes)

<i>compute</i>	<i>compute_modify</i>	<i>fix</i>	<i>fix_modify</i>
<i>uncompute</i>	<i>unfix</i>		

6.4.7 Output

<i>dump image</i>	<i>dump movie</i>	<i>dump</i>	<i>dump_modify</i>
<i>restart</i>	<i>thermo</i>	<i>thermo_modify</i>	<i>thermo_style</i>
<i>undump</i>	<i>write_coeff</i>	<i>write_data</i>	<i>write_dump</i>
<i>write_restart</i>			

6.4.8 Actions

<i>minimize</i>	<i>neb</i>	<i>neb_spin</i>	<i>prd</i>	<i>rerun</i>	<i>run</i>
<i>tad</i>	<i>temper</i>				

6.4.9 Input script control

<i>clear</i>	<i>echo</i>	<i>if</i>	<i>include</i>	<i>info</i>	<i>jump</i>	<i>label</i>
<i>log</i>	<i>next</i>	<i>print</i>	<i>python</i>	<i>quit</i>	<i>shell</i>	<i>variable</i>

6.5 General commands

An alphabetic list of general LAMMPS commands.

<i>angle_coeff</i>	<i>angle_style</i>	<i>angle_write</i>	<i>atom_modify</i>	<i>atom_style</i>	<i>balance</i>
<i>bond_coeff</i>	<i>bond_style</i>	<i>bond_write</i>	<i>boundary</i>	<i>change_box</i>	<i>clear</i>
<i>comm_modify</i>	<i>comm_style</i>	<i>compute</i>	<i>compute_modify</i>	<i>create_atoms</i>	<i>create_bonds</i>
<i>create_box</i>	<i>delete_atoms</i>	<i>delete_bonds</i>	<i>dielectric</i>	<i>dihedral_coeff</i>	<i>dihedral_style</i>
<i>dihedral_write</i>	<i>dimension</i>	<i>displace_atoms</i>	<i>dump</i>	<i>dump_modify</i>	<i>echo</i>
<i>fix</i>	<i>fix_modify</i>	<i>geturl</i>	<i>group</i>	<i>if</i>	<i>improper_coeff</i>
<i>improper_style</i>	<i>include</i>	<i>info</i>	<i>jump</i>	<i>kspace_modify</i>	<i>kspace_style</i>
<i>label</i>	<i>labelmap</i>	<i>lattice</i>	<i>log</i>	<i>mass</i>	<i>minimize</i>
<i>min_modify</i>	<i>min_style</i>	<i>molecule</i>	<i>neigh_modify</i>	<i>neighbor</i>	<i>newton</i>
<i>next</i>	<i>package</i>	<i>pair_coeff</i>	<i>pair_modify</i>	<i>pair_style</i>	<i>pair_write</i>
<i>partition</i>	<i>print</i>	<i>processors</i>	<i>quit</i>	<i>read_data</i>	<i>read_dump</i>
<i>read_restart</i>	<i>region</i>	<i>replicate</i>	<i>rerun</i>	<i>reset_atoms</i>	<i>reset_timestep</i>
<i>restart</i>	<i>run</i>	<i>run_style</i>	<i>set</i>	<i>shell</i>	<i>special_bonds</i>
<i>suffix</i>	<i>thermo</i>	<i>thermo_modify</i>	<i>thermo_style</i>	<i>timer</i>	<i>timestep</i>
<i>uncompute</i>	<i>undump</i>	<i>unfix</i>	<i>units</i>	<i>variable</i>	<i>velocity</i>
<i>write_coeff</i>	<i>write_data</i>	<i>write_dump</i>	<i>write_molecule</i>	<i>write_restart</i>	

Additional general LAMMPS commands provided by packages. A few commands have accelerated versions. This is indicated by an additional letter in parentheses: k = KOKKOS.

<i>dynamical_matrix</i> (k)	<i>group2ndx</i>	<i>hyper</i>	<i>kim</i>	<i>fitpod</i>	<i>mdi</i>
<i>ndx2group</i>	<i>neb</i>	<i>neb/spin</i>	<i>plugin</i>	<i>prd</i>	<i>python</i>
<i>region2vmd</i>	<i>tad</i>	<i>temper</i>	<i>temper/grem</i>	<i>temper/npt</i>	<i>third_order</i> (k)

6.6 Fix styles

An alphabetic list of all LAMMPS *fix* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>accelerate/cos</i>	<i>acks2/reaxff</i> (k)	<i>adapt</i>	<i>adapt/fep</i>
<i>addforce</i> (k)	<i>add/heat</i>	<i>addtorque/atom</i>	<i>addtorque/group</i>
<i>alchemy</i>	<i>align/self</i>	<i>amoeba/bitorsion</i>	<i>amoeba/pitortion</i>
<i>append/atoms</i>	<i>atom/swap</i>	<i>atom_weight/apip</i>	<i>ave/atom</i>
<i>ave/chunk</i>	<i>ave/correlate</i>	<i>ave/correlate/long</i>	<i>ave/grid</i>
<i>ave/histo</i>	<i>ave/histo/weight</i>	<i>ave/moments</i>	<i>ave/time</i>
<i>aveforce</i> (k)	<i>balance</i>	<i>baoab</i>	<i>bocs</i>
<i>bond/break</i>	<i>bond/create</i>	<i>bond/create/angle</i>	<i>bond/react</i>
<i>bond/swap</i>	<i>box/relax</i>	<i>brownian</i>	<i>brownian/asphere</i>
<i>brownian/sphere</i>	<i>charge/regulation</i>	<i>cmap</i> (k)	<i>colvars</i>
<i>controller</i>	<i>damping/cundall</i>	<i>deform</i> (k)	<i>deform/pressure</i>
<i>deposit</i>	<i>dpd/energy</i> (k)	<i>drag</i> (k)	<i>drude</i>
<i>drude/transform/direct</i>	<i>drude/transform/inverse</i>	<i>dt/reset</i> (k)	<i>edpd/source</i>
<i>efield</i> (k)	<i>efield/lepton</i>	<i>efield/tip4p</i>	<i>ehex</i>
<i>electrode/conq</i> (i)	<i>electrode/conq</i> (i)	<i>electrode/thermo</i> (i)	<i>electron/stopping</i> (k)
<i>electron/stopping/fit</i>	<i>enforce2d</i> (k)	<i>eos/cv</i>	<i>eos/table</i>
<i>eos/table/rx</i> (k)	<i>evaporate</i>	<i>external</i> (k)	<i>fll</i>

<i>mesocnt</i>	<i>mm3 (ko)</i>	<i>mwlc (ko)</i>	<i>quartic (ko)</i>	<i>spica (ko)</i>
<i>table (o)</i>				

6.11 Dihedral styles

All LAMMPS *dihedral_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid (k)</i>		
<i>charmm (iko)</i>	<i>charmmfsw (ko)</i>	<i>class2 (ko)</i>	<i>class2xe (ko)</i>	<i>cosine/shift/exp (ko)</i>
<i>cosine/squared/restricted (ko)</i>	<i>fourier (iko)</i>	<i>harmonic (iko)</i>	<i>helix (ko)</i>	<i>lepton (o)</i>
<i>multi/harmonic (ko)</i>	<i>nharmonic (ko)</i>	<i>opls (iko)</i>	<i>quadratic (ko)</i>	<i>spherical (ko)</i>
<i>table (o)</i>	<i>table/cut (o)</i>			

6.12 Improper styles

All LAMMPS *improper_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid (k)</i>		
<i>amoeba</i>	<i>class2 (ko)</i>	<i>cossq (ko)</i>	<i>cvff (iko)</i>	<i>distance (ko)</i>
<i>distharm (ko)</i>	<i>fourier (ko)</i>	<i>harmonic (iko)</i>	<i>inversion/harmonic (ko)</i>	<i>ring (ko)</i>
<i>sqdistharm (ko)</i>	<i>umbrella (ko)</i>			

6.13 KSpace styles

All LAMMPS *kpace_style* solvers. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>esp</i>	<i>ewald (go)</i>	<i>ewald/disp</i>	<i>ewald/disp/dipole</i>	<i>ewald/dipole</i>
<i>ewald/dipole/spin</i>	<i>ewald/electrode</i>	<i>msm (o)</i>	<i>msm/cg (o)</i>	<i>msm/dielectric</i>
<i>pppm (giko)</i>	<i>pppm/cg (o)</i>	<i>pppm/dipole</i>	<i>pppm/dipole/spin</i>	<i>pppm/dielectric</i>
<i>pppm/disp (io)</i>	<i>pppm/disp/tip4p (o)</i>	<i>pppm/disp/dielectric</i>	<i>pppm/rk</i>	<i>pppm/stagger</i>
<i>pppm/tip4p (o)</i>	<i>pppm/dielectric</i>	<i>pppm/electrode (i)</i>	<i>scafacos</i>	<i>zero</i>

6.14 Dump styles

An alphabetic list of all LAMMPS *dump* commands.

<i>atom</i>	<i>atom/adios</i>	<i>atom/gz</i>	<i>atom/zstd</i>	<i>cfg</i>	<i>cfg/gz</i>
<i>cfg/uef</i>	<i>cfg/zstd</i>	<i>custom</i>	<i>custom/adios</i>	<i>custom/gz</i>	<i>custom/zstd</i>

<i>yaml</i>					

6.15 Removed commands and packages

- *amber2lmp tools*
- *ATC, AWPMD, and POEMS packages*
- *Neighbor style and comm mode multi/old*
- *LAMMPS-GUI source code*
- *GJF formulation in fix langevin*
- *LAMMPS shell*
- *i-PI tool*
- *USER-REAXC package*
- *MPIIO package*
- *MSCG package*
- *LATTE package*
- *Minimize style fire/old*
- *Pair style mesont/tpm, compute style mesont, atom style mesont*
- *Box command*
- *Reset_ids, reset_atom_ids, reset_mol_ids commands*
- *MESSAGE package*
- *REAX package*
- *MEAM package*
- *USER-CUDA package*
- *Compute atom/molecule*
- *Fix ave/spatial and fix ave/spatial/sphere*
- *restart2data tool*

This page lists LAMMPS commands and packages that have been removed from the distribution and provides suggestions for alternatives or replacements. LAMMPS has special dummy styles implemented, that will stop LAMMPS and print a suitable error message in most cases, when a style/command is used that has been removed or will replace the command with the direct alternative (if available) and print a warning.

6.15.1 amber2lmp tools

Deprecated since version 11Feb2026.

The tools in the `tools/amber2lmp` folder have been removed because they were unmaintained for a long time and required Python 2 which has been obsolete for a long time. Instead the external [AMBER2LAMMPS tool](#) can be used for the same purpose. There is an *Howto_amber2lammps* included in this manual.

6.15.2 ATC, AWPMD, and POEMS packages

Deprecated since version 10Sep2025.

The ATC, AWPMD, and POEMS packages are removed because they were unmaintained for a long time and their legacy C++ programming style started to create problems with modern C++ compilers. LAMMPS version 22 July 2025 is the last version that contains them. You have to download and compile this version, if you want to use any of these packages.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

fix atc command

Deprecated since version 10Sep2025.

The ATC package and the *fix atc* command have been removed from LAMMPS.

The ATC package and the *fix atc* command have been removed from LAMMPS.

6.15.3 Neighbor style and comm mode multi/old

Deprecated since version 10Sep2025.

The original implementation of neighbor style multi and comm mode multi, most recently available under “multi/old” has been removed. The new implementation should be used instead.

6.15.4 LAMMPS-GUI source code

Deprecated since version 10Sep2025.

The LAMMPS-GUI sources used to be included in LAMMPS but they are now hosted in their own git repository at <https://github.com/akohlmeier/lammps-gui/> and the corresponding online documentation is at <https://lammps-gui.lammps.org/>

6.15.5 GJF formulation in fix langevin

Deprecated since version 22Jul2025.

The *gjf* keyword in *fix langevin* has been removed. The GJF functionality has been moved to its own *fix style gjf*.

6.15.6 LAMMPS shell

Deprecated since version 29Aug2024.

The LAMMPS shell has been removed from the LAMMPS distribution. Users are encouraged to use the *LAMMPS-GUI* tool instead.

6.15.7 i-PI tool

Deprecated since version 27Jun2024.

The i-PI tool has been removed from the LAMMPS distribution. Instead, instructions to install i-PI from PyPI via pip are provided.

6.15.8 USER-REAXC package

Deprecated since version 7Feb2024.

The USER-REAXC package has been renamed to *REAXFF*. In the process also the pair style and related fixes were renamed to use the “reaxff” string instead of “reax/c”. For a while LAMMPS was maintaining backward compatibility by providing aliases for the styles. These have been removed, so using “reaxff” is now *required*.

6.15.9 MPIIO package

Deprecated since version 21Nov2023.

The MPIIO package has been removed from LAMMPS since it was unmaintained for many years and thus not updated to incorporate required changes that had been applied to the corresponding non-MPIIO commands. As a consequence the MPIIO commands had become unreliable and sometimes crashing LAMMPS or corrupting data. Similar functionality is available through the *ADIOS package* and the *NETCDF package*. Also, the *dump_modify nfile* or *dump_modify fileper* keywords may be used for an efficient way of writing out dump files when running on large numbers of processors. Similarly, the “nfile” and “fileper” keywords exist for restarts: see *restart*, *read_restart*, *write_restart*.

6.15.10 MSCG package

Deprecated since version 21Nov2023.

The MSCG package has been removed from LAMMPS since it was unmaintained for many years and instead superseded by the *OpenMSCG software* of the Voth group at the University of Chicago, which can be used independent from LAMMPS.

6.15.11 LATTE package

Deprecated since version 15Jun2023.

The LATTE package with the fix latte command was removed from LAMMPS. This functionality has been superseded by *fix mdi/qm* and *fix mdi/qmmm* from the *MDI package*. These fixes are compatible with several quantum software packages, including LATTE. See the *examples/QUANTUM* dir and the *MDI coupling HOWTO* page. MDI supports running LAMMPS with LATTE as a plugin library (similar to the way fix latte worked), as well as on a different set of MPI processors.

6.15.12 Minimize style fire/old

Deprecated since version 8Feb2023.

Minimize style *fire/old* has been removed. Its functionality can be reproduced with style *fire* with specific options. Please see the *min_modify command* documentation for details.

6.15.13 Pair style mesont/tpm, compute style mesont, atom style mesont

Deprecated since version 8Feb2023.

Pair style *mesont/tpm*, compute style *mesont*, and atom style *mesont* have been removed from the *MESONT package*. The same functionality is available through *pair style mesocnt*, *bond style mesocnt* and *angle style mesocnt*.

6.15.14 Box command

Deprecated since version 22Dec2022.

The *box* command has been removed and the LAMMPS code changed so it won’t be needed. If present, LAMMPS will ignore the command and print a warning.

6.15.15 Reset_ids, reset_atom_ids, reset_mol_ids commands

Deprecated since version 22Dec2022.

The *reset_ids*, *reset_atom_ids*, and *reset_mol_ids* commands have been folded into the *reset_atoms* command. If present, LAMMPS will replace the commands accordingly and print a warning.

6.15.16 MESSAGE package

Deprecated since version 4May2022.

The MESSAGE package has been removed since it was superseded by the *MDI package*. MDI implements the same functionality and in a more general way with direct support for more applications.

6.15.17 REAX package

Deprecated since version 4Jan2019.

The REAX package has been removed since it was superseded by the *REAXFF package*. The REAXFF package has been tested to yield equivalent results to the REAX package, offers better performance, supports OpenMP multi-threading via OPENMP, and GPU and threading parallelization through KOKKOS. The new pair styles are not syntax compatible with the removed reax pair style, so input files will have to be adapted. The REAXFF package was originally called USER-REAXC.

6.15.18 MEAM package

Deprecated since version 4Jan2019.

The MEAM package in Fortran has been replaced by a C++ implementation. The code in the *MEAM package* is a translation of the Fortran code of MEAM into C++, which removes several restrictions (e.g. there can be multiple instances in hybrid pair styles) and allows for some optimizations leading to better performance. The pair style *meam* has the exact same syntax. For a transition period the C++ version of MEAM was called USER-MEAMC so it could coexist with the Fortran version.

6.15.19 USER-CUDA package

Deprecated since version 31May2016.

The USER-CUDA package had been removed, since it had been unmaintained for a long time and had known bugs and problems. Significant parts of the design were transferred to the *KOKKOS package*, which has similar performance characteristics on NVIDIA GPUs. Both, the KOKKOS and the *GPU package* are maintained and allow running LAMMPS with GPU acceleration.

6.15.20 Compute atom/molecule

Deprecated since version 11: Dec2015

The atom/molecule command has been removed from LAMMPS since it was superseded by the more general and extensible “chunk infrastructure”. Here the system is partitioned in one of many possible ways - including using molecule IDs - through the *compute chunk/atom* command and then summing is done using *compute reduce/chunk*. Please refer to the *chunk HOWTO* section for an overview.

6.15.21 Fix ave/spatial and fix ave/spatial/sphere

Deprecated since version 11Dec2015.

The fixes ave/spatial and ave/spatial/sphere have been removed from LAMMPS since they were superseded by the more general and extensible “chunk infrastructure”. Here the system is partitioned in one of many possible ways through

the *compute chunk/atom* command and then averaging is done using *fix ave/chunk*. Please refer to the *chunk HOWTO* section for an overview.

6.15.22 restart2data tool

Deprecated since version 23Nov2013.

The functionality of the restart2data tool has been folded into the LAMMPS executable directly instead of having a separate tool. A combination of the commands *read_restart* and *write_data* can be used to the same effect. For added convenience this conversion can also be triggered by *command-line flags*

ACCELERATE PERFORMANCE

This section describes various methods for improving LAMMPS performance for different classes of problems running on different kinds of machines.

There are two thrusts to the discussion that follows. The first is using code options that implement alternate algorithms that can speed-up a simulation. The second is to use one of the several accelerator packages provided with LAMMPS that contain code optimized for certain kinds of hardware, including multicore CPUs and GPUs.

The [Benchmark](#) page of the LAMMPS website gives performance results for the various accelerator packages discussed on the [Accelerator packages](#) page, for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

7.1 Benchmarks

Current LAMMPS performance is discussed on the [Benchmarks](#) page of the [LAMMPS website](#) where timings and parallel efficiency are listed. The page has several sections, which are briefly described below:

- CPU performance on 5 standard problems, strong and weak scaling
- GPU performance on same and related problems
- Comparison of cost of interatomic potentials
- Performance of huge, billion-atom problems

The 5 standard problems are as follow:

1. LJ = atomic fluid, Lennard-Jones potential with 2.5 sigma cutoff (55 neighbors per atom), NVE integration
2. Chain = bead-spring polymer melt of 100-mer chains, FENE bonds and LJ pairwise interactions with a $2\frac{1}{2}$ sigma cutoff (5 neighbors per atom), NVE integration
3. EAM = metallic solid, Cu EAM potential with 4.95 Angstrom cutoff (45 neighbors per atom), NVE integration
4. Chute = granular chute flow, frictional history potential with 1.1 sigma cutoff (7 neighbors per atom), NVE integration
5. Rhodo = rhodopsin protein in solvated lipid bilayer, CHARMM force field with a 10 Angstrom LJ cutoff (440 neighbors per atom), particle-particle particle-mesh (PPPM) for long-range Coulombics, NPT integration

Input files for these 5 problems are provided in the bench directory of the LAMMPS distribution. Each has 32,000 atoms and runs for 100 timesteps. The size of the problem (number of atoms) can be varied using command-line switches as described in the bench/README file. This is an easy way to test performance and either strong or weak scalability on your machine.

The bench directory includes a few log.* files that show performance of these 5 problems on 1 or 4 cores of Linux desktop. The bench/FERMI and bench/KEPLER directories have input files and scripts and instructions for running the same (or similar) problems using OpenMP or GPU or Xeon Phi acceleration options. See the README files in those

directories and the *Accelerator packages* pages for instructions on how to build LAMMPS and run on that kind of hardware.

The bench/POTENTIALS directory has input files which correspond to the table of results on the [Potentials](#) section of the Benchmarks web page. So you can also run those test problems on your machine.

The [billion-atom](#) section of the Benchmarks web page has performance data for very large benchmark runs of simple Lennard-Jones (LJ) models, which use the bench/in.lj input script.

For all the benchmarks, a useful metric is the CPU cost per atom per timestep. Since performance scales roughly linearly with problem size and timesteps for all LAMMPS models (i.e. interatomic or coarse-grained potentials), the run time of any problem using the same model (atom style, force field, cutoff, etc) can then be estimated.

Performance on a parallel machine can also be predicted from one-core or one-node timings if the parallel efficiency can be estimated. The communication bandwidth and latency of a particular parallel machine affects the efficiency. On most machines LAMMPS will give a parallel efficiency on these benchmarks above 50% so long as the number of atoms/core is a few 100 or greater, and closer to 100% for large numbers of atoms/core. This is for all-MPI mode with one MPI task per core. For nodes with accelerator options or hardware (OpenMP, GPU, Phi), you should first measure single node performance. Then you can estimate parallel performance for multi-node runs using the same logic as for all-MPI mode, except that now you will typically need many more atoms/node to achieve good scalability.

7.2 Measuring performance

7.2.1 Factors that influence performance

Before trying to make your simulation run faster, you should understand how it currently performs and where the bottlenecks are. We generally distinguish between serial performance (how fast can a single process do the calculations?) and parallel efficiency (how much faster does a calculation get by using more processes?). There are many factors affecting either and below are some lists discussing some commonly known but also some less known factors.

Factors affecting serial performance (in no specific order):

- CPU hardware: clock rate, cache sizes, CPU architecture (instructions per clock, vectorization support, fused multiply-add support and more)
- RAM speed and number of channels that the CPU can use to access RAM
- Cooling: CPUs can change the CPU clock based on thermal load, thus the degree of cooling can affect the speed of a CPU. Sometimes even the temperature of neighboring compute nodes in a cluster can make a difference.
- Compiler optimization: most of LAMMPS is written to be easy to modify and thus compiler optimization can speed up calculations. However, too aggressive compiler optimization can produce incorrect results or crashes (during compilation or at runtime).
- Source code improvements: styles in the OPT, OPENMP, and INTEL package can be faster than their base implementation due to improved data access patterns, cache efficiency, or vectorization. Compiler optimization is required to take full advantage of these.
- Number and kind of fixes, computes, or variables used during a simulation, especially if they result in collective communication operations
- Pair style cutoffs and system density: calculations get slower the more neighbors are in the neighbor list and thus for which interactions need to be computed. Force fields with pair styles that compute interactions between triples or quadruples of atoms or that use embedding energies or charge equilibration will need to walk the neighbor lists multiple times.
- Neighbor list settings: tradeoff between neighbor list skin (larger skin = more neighbors, more distances to compute before applying the cutoff) and frequency of neighbor list builds (larger skin = fewer neighbor list builds).

- Proximity of per-atom data in physical memory that for atoms that are close in space improves cache efficiency (thus LAMMPS will by default sort atoms in local storage accordingly)
- Using r-RESPA multi-timestepping or a SHAKE or RATTLE fix to constrain bonds with higher-frequency vibrations may allow a larger (outer) timestep and thus fewer force evaluations (usually the most time consuming step in MD) for the same simulated time (with some tradeoff in accuracy).

Factors affecting parallel efficiency (in no specific order):

- Bandwidth and latency of communication between processes. This can vary a lot between processes on the same CPU or physical node and processes on different physical nodes and there vary between different communication technologies (like Ethernet or InfiniBand or other high-speed interconnects)
- Frequency and complexity of communication patterns required
- Number of “work units” (usually correlated with the number of atoms and choice of force field) per MPI-process required for one time step (if this number becomes too small, the cost of communication becomes dominant).
- Choice of parallelization method (MPI-only, OpenMP-only, MPI+OpenMP, MPI+GPU, MPI+GPU+OpenMP)
- Algorithmic complexity of the chosen force field (pair-wise vs. many-body potential, Ewald vs. PPPM vs. (compensated or smoothed) cutoff-Coulomb)
- Communication cutoff: a larger cutoff results in more ghost atoms and thus more data that needs to be communicated
- Frequency of neighbor list builds: during a neighbor list build the domain decomposition is updated and the list of ghost atoms rebuilt which requires multiple global communication steps
- FFT-grid settings and number of MPI processes for kspace style PPPM: PPPM uses parallel 3d FFTs which will drop much faster in parallel efficiency with respect to the number of MPI processes than other parts of the force computation. Thus using MPI+OpenMP parallelization or *run style verlet/split* can improve parallel efficiency by limiting the number of MPI processes used for the FFTs.
- Load (im-)balance: LAMMPS’ domain decomposition assumes that atoms are evenly distributed across the entire simulation box. If there are areas of vacuum, this may lead to different amounts of work for different MPI processes. Using the *processors command* to change the spatial decomposition, or MPI+OpenMP parallelization instead of only-MPI to have larger sub-domains, or the (fix) balance command (without or with switching to communication style tiled) to change the sub-domain volumes are all methods that can help to avoid load imbalances.

7.2.2 Examples comparing serial performance

Before looking at your own input deck(s), you should get some reference data from a known input so that you know what kind of performance you should expect from your input. For the following we therefore use the `in.rhodo.scaled` input file and `data.rhodo` data file from the `bench` folder. This is a system of 32000 atoms using the CHARMM force field and long-range electrostatics running for 100 MD steps. The performance data is printed at the end of a run and only measures the performance during propagation and excludes the setup phase.

Running with a single MPI process on an AMD Ryzen Threadripper PRO 9985WX CPU (64 cores, 128 threads, base clock: 3.2GHz, max. clock 5.4GHz, L1/L2/L3 cache 5MB/64MB/256MB, 8 DDR5-6400 memory channels) one gets the following performance report:

Performance: 1.232 ns/day, 19.476 hours/ns, 7.131 timesteps/s, 228.197 katom-step/s
99.2% CPU use with 1 MPI tasks x 1 OpenMP threads

The %CPU value should be at 100% or very close. Lower values would be an indication that there are *other* processes also using the same CPU core and thus invalidating the performance data. The katom-step/s value is best suited for comparisons, since it is fairly independent from the system size. The *in.rhodo.scaled* input can be easily made larger

through replication in the three dimensions by settings variables “x”, “y”, “z” to values other than 1 from the command line with the “-var” flag. Example:

- 32000 atoms: 228.8 katom-step/s
- 64000 atoms: 231.6 katom-step/s
- 128000 atoms: 231.1 katom-step/s
- 256000 atoms: 226.4 katom-step/s
- 864000 atoms: 229.6 katom-step/s

Comparing to an AMD Ryzen 7 7840HS CPU (8 cores, 16 threads, base clock 3.8GHz, max. clock 5.1GHz, L1/L2/L3 cache 512kB/8MB/16MB, 2 DDR5-5600 memory channels), we get similar single core performance (~220 katom-step/s vs. ~230 katom-step/s) due to the similar clock and architecture:

- 32000 atoms: 219.8 katom-step/s
- 64000 atoms: 222.5 katom-step/s
- 128000 atoms: 216.8 katom-step/s
- 256000 atoms: 221.0 katom-step/s
- 864000 atoms: 221.1 katom-step/s

Switching to an older Intel Xeon E5-2650 v4 CPU (12 cores, 12 threads, base clock 2.2GHz, max. clock 2.9GHz, L1/L2/L3 cache (64kB/256kB/30MB, 4 DDR4-2400 memory channels) leads to a lower performance of approximately 109 katom-step/s due to differences in architecture and clock. In all cases, when looking at multiple runs, the katom-step/s property fluctuates by approximately 1% around the average.

From here on we are looking at the performance for the 256000 atom system only and change several settings incrementally:

1. No compiler optimization GCC (-Og -g): 183.8 katom-step/s
2. Moderate optimization with debug info GCC (-O2 -g): 231.1 katom-step/s
3. Full compiler optimization GCC (-DNDEBUG -O3): 236.0 katom-step/s
4. Aggressive compiler optimization GCC (-O3 -ffast-math -march=native): 239.9 katom-step/s
5. Source code optimization in OPENMP package (1 thread): 266.7 katom-step/s
6. Use *fix nvt* instead of *fix npt* (compute virial only every 50 steps): 272.9 katom-step/s
7. Increase pair style cutoff by 2 Å: 181.2 katom-step/s
8. Use tight PPPM convergence (1.0e-6 instead of 1.0e-4): 161.9 katom-step/s
9. Use Ewald summation instead of PPPM (at 1.0e-4 convergence): 19.9 katom-step/s

The numbers show that gains from aggressive compiler optimizations are rather small in LAMMPS, the data access optimizations in the OPENMP (and OPT) packages are more prominent. On the other side, using more accurate force field settings causes, not unexpectedly, a significant slowdown (to about half the speed). Finally, using regular Ewald summation causes a massive slowdown due to the bad algorithmic scaling with system size.

7.2.3 Examples comparing parallel performance

The parallel performance usually goes on top of the serial performance. Using twice as many processors should increase the performance metric by up to a factor of two. With the number of processors N and the serial performance p_1 and the performance for N processors p_N we can define a *parallel efficiency* in percent as follows:

$$P_{eff} = \frac{p_N}{p_1 \cdot N} \cdot 100\%$$

For the AMD Ryzen Threadripper PRO 9985WX CPU and the serial simulation settings of point 6. from above, we get the following parallel efficiency data for the 256000 atom system:

- 1 MPI task: 273.6 katom-step/s, $P_{eff} = 100\%$
- 2 MPI tasks: 530.6 katom-step/s, $P_{eff} = 97\%$
- 4 MPI tasks: 1.021 Matom-step/s, $P_{eff} = 93\%$
- 8 MPI tasks: 1.837 Matom-step/s, $P_{eff} = 84\%$
- 16 MPI tasks: 3.574 Matom-step/s, $P_{eff} = 82\%$
- 32 MPI tasks: 6.479 Matom-step/s, $P_{eff} = 74\%$
- 64 MPI tasks: 9.032 Matom-step/s, $P_{eff} = 52\%$
- 128 MPI tasks: 12.03 Matom-step/s, $P_{eff} = 34\%$

The 128 MPI tasks run uses CPU cores from hyper-threading.

For a small system with only 32000 atoms the parallel efficiency drops off earlier when the number of work units is too small relative to the communication overhead:

- 1 MPI task: 270.8 katom-step/s, $P_{eff} = 100\%$
- 2 MPI tasks: 529.3 katom-step/s, $P_{eff} = 98\%$
- 4 MPI tasks: 989.8 katom-step/s, $P_{eff} = 91\%$
- 8 MPI tasks: 1.832 Matom-step/s, $P_{eff} = 85\%$
- 16 MPI tasks: 3.463 Matom-step/s, $P_{eff} = 80\%$
- 32 MPI tasks: 5.970 Matom-step/s, $P_{eff} = 69\%$
- 64 MPI tasks: 7.477 Matom-step/s, $P_{eff} = 42\%$
- 128 MPI tasks: 8.069 Matom-step/s, $P_{eff} = 23\%$

7.2.4 Measuring performance of your input deck

The best way to do this is run the your system (actual number of atoms) for a modest number of timesteps (say 100 steps) on several different processor counts, including a single processor if possible. Do this for an equilibrium version of your system, so that the 100-step timings are representative of a much longer run. There is typically no need to run for 1000s of timesteps to get accurate timings; you can simply extrapolate from short runs.

For the set of runs, look at the timing data printed to the screen and log file at the end of each LAMMPS run. The [screen and logfile output](#) page gives an overview.

Running on one (or a few processors) should give a good estimate of the serial performance and what portions of the timestep are taking the most time. Running the same problem on a few different processor counts should give an estimate of parallel scalability. I.e. if the simulation runs 16x faster on 16 processors, its 100% parallel efficient; if it runs 8x faster on 16 processors, it's 50% efficient.

The most important data to look at in the timing info is the timing breakdown and relative percentages. For example, trying different options for speeding up the long-range solvers will have little impact if they only consume 10% of the run time. If the pairwise time is dominating, you may want to look at GPU or OMP versions of the pair style, as discussed below. Comparing how the percentages change as you increase the processor count gives you a sense of how different operations within the timestep are scaling. If you are using PPPM as Kspace solver, you can turn on an additional output with `kpace_modify fftbench yes` which measures the time spent during PPPM on the 3d FFTs, which can be communication intensive for larger processor counts. This provides an indication whether it is worth trying out alternatives to the default FFT settings for additional performance.

Another important detail in the timing info are the histograms of atoms counts and neighbor counts. If these vary widely across processors, you have a load-imbalance issue. This often results in inaccurate relative timing data, because processors have to wait when communication occurs for other processors to catch up. Thus the reported times for “Communication” or “Other” may be higher than they really are, due to load-imbalance. If this is an issue, you can use the `timer sync` command to obtain synchronized timings.

7.3 General tips

Note

this page is still a work in progress

Here is a list of general ideas for improving simulation performance. Most of them are only applicable to certain models and certain bottlenecks in the current performance, so let the timing data you generate be your guide. It is hard, if not impossible, to predict how much difference these options will make, since it is a function of problem size, number of processors used, and your machine. There is no substitute for identifying performance bottlenecks, and trying out various options.

- rRESPA
- Two-FFT PPPM
- Staggered PPPM
- single vs double PPPM
- partial charge PPPM
- verlet/split run style
- processor command for proc layout and numa layout
- load-balancing: balance and fix balance

Two-FFT PPPM, also called *analytic differentiation* or *ad* PPPM, uses 2 FFTs instead of the 4 FFTs used by the default *ik differentiation* PPPM. However, 2-FFT PPPM also requires a slightly larger mesh size to achieve the same accuracy as 4-FFT PPPM. For problems where the FFT cost is the performance bottleneck (typically large problems running on many processors), 2-FFT PPPM may be faster than 4-FFT PPPM.

Staggered PPPM performs calculations using two different meshes, one shifted slightly with respect to the other. This can reduce force aliasing errors and increase the accuracy of the method, but also doubles the amount of work required. For high relative accuracy, using staggered PPPM allows one to half the mesh size in each dimension as compared to regular PPPM, which can give around a 4x speedup in the kspace time. However, for low relative accuracy, using staggered PPPM gives little benefit and can be up to 2x slower in the kspace time. For example, the rhodopsin benchmark was run on a single processor, and results for kspace time vs. relative accuracy for the different methods are shown in the figure below. For this system, staggered PPPM (using ik differentiation) becomes useful when using a relative accuracy of slightly greater than 1e-5 and above.

Note

Using staggered PPPM may not give the same increase in accuracy of energy and pressure as it does in forces, so some caution must be used if energy and/or pressure are quantities of interest, such as when using a barostat.

7.4 Accelerator packages

Accelerated versions of various *pair_style*, *fixes*, *computes*, and other commands have been added to LAMMPS, which will typically run faster than the standard non-accelerated versions. Some require appropriate hardware to be present on your system, e.g. GPUs.

All of these commands are in packages provided with LAMMPS. An overview of packages is give on the [Packages](#) doc pages.

These are the accelerator packages currently in LAMMPS:

<i>GPU Package</i>	for GPUs via CUDA, OpenCL, or ROCm HIP
<i>INTEL Package</i>	for Intel CPUs
<i>KOKKOS Package</i>	for GPUs and threading via the Kokkos library
<i>OPENMP Package</i>	for OpenMP threading and generic CPU optimizations
<i>OPT Package</i>	generic CPU optimizations

7.4.1 GPU package

The GPU package was developed by Mike Brown while at SNL and ORNL (now at Intel Corp.) and his collaborators, particularly Trung Nguyen (now at Northwestern). Support for AMD GPUs via HIP was added by Vsevolod Nikolskiy and coworkers at HSE University.

The GPU package provides GPU versions of many pair styles and for parts of the *k_{space}_style pppm* for long-range Coulombics. It has the following general features:

- It is designed to exploit common GPU hardware configurations where one or more GPUs are coupled to many cores of one or more multicore CPUs, e.g. within a node of a parallel machine.
- Atom-based data (e.g. coordinates, forces) are moved back-and-forth between the CPU(s) and GPU every timestep.
- Neighbor lists can be built on the CPU or on the GPU
- The charge assignment and force interpolation portions of PPPM can be run on the GPU. The FFT portion, which requires MPI communication between processors, runs on the CPU.
- Force computations of different style (pair vs. bond/angle/dihedral/improper) can be performed concurrently on the GPU and CPU(s), respectively.
- It allows for GPU computations to be performed in single or double precision, or in mixed-mode precision, where pairwise forces are computed in single precision, but accumulated into double-precision force vectors.
- LAMMPS-specific code is in the GPU package. It makes calls to a generic GPU library in the `lib/gpu` directory. This library provides either Nvidia support, AMD support, or more general OpenCL support (for Nvidia GPUs, AMD GPUs, Intel GPUs, and multicore CPUs). so that the same functionality is supported on a variety of hardware.

Required hardware/software

To compile and use this package in CUDA mode, you currently need to have an NVIDIA GPU and install the corresponding NVIDIA CUDA toolkit software on your system (this is only tested on Linux and unsupported on Windows):

- Check if you have an NVIDIA GPU: `cat /proc/driver/nvidia/gpus/\*/information`
- Go to <https://developer.nvidia.com/cuda-downloads>
- Install a driver and toolkit appropriate for your system (SDK is not necessary)
- Run `lammps/lib/gpu/nvc_get_devices` (after building the GPU library, see below) to list supported devices and properties

To compile and use this package in OpenCL mode, you currently need to have the OpenCL headers and the (vendor neutral) OpenCL library installed. In OpenCL mode, the acceleration depends on having an [OpenCL Installable Client Driver \(ICD\)](#) installed. There can be multiple of them for the same or different hardware (GPUs, CPUs, Accelerators) installed at the same time. OpenCL refers to those as ‘platforms’. The GPU library will try to auto-select the best suitable platform, but this can be overridden using the `platform` option of the *package* command. run `lammps/lib/gpu/ocl_get_devices` to get a list of available platforms and devices with a suitable ICD available.

To compile and use this package for Intel GPUs, OpenCL or the Intel oneAPI HPC Toolkit can be installed using linux package managers. The latter also provides optimized C++, MPI, and many other libraries and tools. See:

- <https://software.intel.com/content/www/us/en/develop/tools/oneapi/hpc-toolkit/download.html>

If you do not have a discrete GPU card installed, this package can still provide significant speedups on some CPUs that include integrated GPUs. Additionally, for many macs, OpenCL is already included with the OS and Makefiles are available in the `lib/gpu` directory.

To compile and use this package in HIP mode, you have to have the AMD ROCm software installed. Versions of ROCm older than 3.5 are currently deprecated by AMD.

Building LAMMPS with the GPU package

See the *Build extras* page for instructions.

Run with the GPU package from the command-line

The `mpirun` or `mpiexec` command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the `mpirun` command in MPICH does this via its `-np` and `-ppn` switches. Ditto for OpenMPI via `-np` and `-npernode`.

When using the GPU package, you cannot assign more than one GPU to a single MPI task. However multiple MPI tasks can share the same GPU, and in many cases it will be more efficient to run this way. Likewise it may be more efficient to use less MPI tasks/node than the available # of CPU cores. Assignment of multiple MPI tasks to a GPU will happen automatically if you create more MPI tasks/node than there are GPUs/node. E.g. with 8 MPI tasks/node and 2 GPUs, each GPU will be shared by 4 MPI tasks.

The GPU package also has limited support for OpenMP for both multi-threading and vectorization of routines that are run on the CPUs. This requires that the GPU library and LAMMPS are built with flags to enable OpenMP support (e.g. `-fopenmp`). Some styles for time integration are also available in the GPU package. These run completely on the CPUs in full double precision, but exploit multi-threading and vectorization for faster performance.

Use the `-sf gpu` *command-line switch*, which will automatically append “gpu” to styles that support it. Use the `-pk gpu Ng` *command-line switch* to set `Ng` = # of GPUs/node to use. If `Ng` is 0, the number is selected automatically as the number of matching GPUs that have the highest number of compute cores.

```
# 1 MPI task uses 1 GPU
lmp_machine -sf gpu -pk gpu 1 -in in.script

# 12 MPI tasks share 2 GPUs on a single 16-core (or whatever) node
mpirun -np 12 lmp_machine -sf gpu -pk gpu 2 -in in.script

# ditto on 4 16-core nodes
mpirun -np 48 -ppn 12 lmp_machine -sf gpu -pk gpu 2 -in in.script
```

Note that if the `-sf gpu` switch is used, it also issues a default `package gpu 0` command, which will result in automatic selection of the number of GPUs to use.

Using the `-pk` switch explicitly allows for setting of the number of GPUs/node to use and additional options. Its syntax is the same as the `package gpu` command. See the *package* command page for details, including the default values used for all its options if it is not specified.

Note that the default for the `package gpu` command is to set the Newton flag to “off” pairwise interactions. It does not affect the setting for bonded interactions (LAMMPS default is “on”). The “off” setting for pairwise interaction is currently required for GPU package pair styles.

Run with the GPU package by editing an input script

The discussion above for the `mpirun` or `mpiexec` command, MPI tasks/node, and use of multiple MPI tasks/GPU is the same.

Use the *suffix gpu* command, or you can explicitly add an “gpu” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/gpu 2.5
```

You must also use the `package gpu` command to enable the GPU package, unless the `-sf gpu` or `-pk gpu` *command-line switches* were used. It specifies the number of GPUs/node to use, as well as other options.

Speed-up to expect

The performance of a GPU versus a multicore CPU is a function of your hardware, which pair style is used, the number of atoms/GPU, and the precision used on the GPU (double, single, mixed). Using the GPU package in OpenCL mode on CPUs (which uses vectorization and multithreading) is usually resulting in inferior performance compared to using LAMMPS' native threading and vectorization support in the OPENMP and INTEL packages.

See the [Benchmark page](#) of the LAMMPS website for performance of the GPU package on various hardware, including the Titan HPC platform at ORNL.

You should also experiment with how many MPI tasks per GPU to use to give the best performance for your problem and machine. This is also a function of the problem size and the pair style being using. Likewise, you should experiment with the precision setting for the GPU library to see if single or mixed precision will give accurate results, since they will typically be faster.

MPI parallelism typically outperforms OpenMP parallelism, but in some cases using fewer MPI tasks and multiple OpenMP threads with the GPU package can give better performance. 3-body potentials can often perform better with multiple OMP threads because the inter-process communication is higher for these styles with the GPU package in order to allow deterministic results.

Guidelines for best performance

- Using multiple MPI tasks (2-10) per GPU will often give the best performance, as allowed by most multicore CPU/GPU configurations. Using too many MPI tasks will result in worse performance due to growing overhead with the growing number of MPI tasks.
- If the number of particles per MPI task is small (e.g. 100s of particles), it can be more efficient to run with fewer MPI tasks per GPU, even if you do not use all the cores on the compute node.
- The [package gpu](#) command has several options for tuning performance. Neighbor lists can be built on the GPU or CPU. Force calculations can be dynamically balanced across the CPU cores and GPUs. GPU-specific settings can be made which can be optimized for different hardware. See the [package](#) command page for details.
- As described by the [package gpu](#) command, GPU accelerated pair styles can perform computations asynchronously with CPU computations. The “Pair” time reported by LAMMPS will be the maximum of the time required to complete the CPU pair style computations and the time required to complete the GPU pair style computations. Any time spent for GPU-enabled pair styles for computations that run simultaneously with [bond](#), [angle](#), [dihedral](#), [improper](#), and [long-range](#) calculations will not be included in the “Pair” time.
- Since only part of the pppm kspace style is GPU accelerated, it may be faster to only use GPU acceleration for Pair styles with long-range electrostatics. See the “pair/only” keyword of the [package command](#) for a shortcut to do that. The distribution of work between kspace on the CPU and non-bonded interactions on the GPU can be balanced through adjusting the coulomb cutoff without loss of accuracy.
- When the *mode* setting for the package gpu command is force/neighbor, the time for neighbor list calculations on the GPU will be added into the “Pair” time, not the “Neighbor” time. An additional breakdown of the times required for various tasks on the GPU (data copy, neighbor calculations, force computations, etc) are output only with the LAMMPS screen output (not in the log file) at the end of each run. These timings represent total time spent on the GPU for each routine, regardless of asynchronous CPU calculations.
- The output section “GPU Time Info (average)” reports “Max Mem / Proc”. This is the maximum memory used at one time on the GPU for data storage by a single MPI process.

Restrictions

When using [hybrid pair styles](#), the neighbor list must be generated on the host instead of the GPU and thus the potential GPU acceleration is reduced.

7.4.2 INTEL package

The INTEL package currently has no official maintainer. It accelerates simulations on Intel CPUs by running in single, mixed, or double precision with vectorization and multi-threading.

Currently Available INTEL Styles

- Angle Styles: *charmm*, *harmonic*
- Bond Styles: *fene*, *harmonic*
- Dihedral Styles: *charmm*, *fourier*, *harmonic*, *opls*
- Fixes: *nve*, *npt*, *nvt*, *nvt/sllod*, *nve/asphere*, *electrode/conp*, *electrode/conq*, *electrode/thermo*
- Improper Styles: *cvff*, *harmonic*
- Pair Styles: *airebo*, *airebo/morse*, *buck/coul/cut*, *buck/coul/long*, *doc:buck <pair_buck>*, *dpd*, *eam*, *eam/alloy*, *eam/fs*, *gayberne*, *lj/charmm/coul/charmm*, *lj/charmm/coul/long*, *lj/cut*, *lj/cut/coul/long*, *lj/long/coul/long*, *rebo*, *snap*, *sw*, *tersoff*
- K-Space Styles: *pppm*, *pppm/disppppm/electrode*

Warning

None of the styles in the INTEL package currently support computing per-atom stress. If any compute or fix in your input requires it, LAMMPS will abort with an error message.

Speed-up to expect

The speedup will depend on your simulation, the hardware, which styles are used, the number of atoms, and the floating-point precision mode. Performance improvements are shown compared to LAMMPS *without using other acceleration packages* as these are under active development (and subject to performance changes). The measurements were performed using the input files available in the `src/INTEL/TEST` directory with the provided run script. These are scalable in size; the results given are with 512K particles (524K for Liquid Crystal). Most of the simulations are standard LAMMPS benchmarks (indicated by the filename extension in parenthesis) with modifications to the run length and to add a warm-up run.

Results are speedups obtained on Intel Xeon E5-2697v4 processors (code-named Broadwell) and Intel Xeon Gold 6148 processors (code-named Skylake) with “June 2017” LAMMPS built with Intel Parallel Studio 2017 update 2. Results are with 1 MPI task per physical core. See `src/INTEL/TEST/README` for the raw simulation rates and instructions to reproduce.

Accuracy and order of operations

In most molecular dynamics software, parallelization parameters (# of MPI, OpenMP, and vectorization) can change the results due to changing the order of operations with finite-precision calculations. The INTEL package is deterministic. This means that the results should be reproducible from run to run with the *same* parallel configurations and when using deterministic libraries or library settings (MPI, OpenMP, FFT). However, there are differences in the INTEL package that can change the order of operations compared to LAMMPS without acceleration:

- Neighbor lists can be created in a different order
- Bins used for sorting atoms can be oriented differently
- The default stencil order for PPPM is 7. By default, LAMMPS will calculate other PPPM parameters to fit the desired accuracy with this order
- The *newton* setting applies to all atoms, not just atoms shared between MPI tasks
- Vectorization can change the order for adding pairwise forces
- When using the `-DLMP_USE_MKL_RNG` define (all included intel optimized makefiles do) at build time, the random number generator for dissipative particle dynamics (`pair style dpd/intel`) uses the Mersenne Twister generator included in the Intel MKL library (that should be more robust than the default Masaglia random number generator)

The precision mode (described below) used with the INTEL package can change the *accuracy* of the calculations. For the default *mixed* precision option, calculations between pairs or triplets of atoms are performed in single precision, intended to be within the inherent error of MD simulations. All accumulation is performed in double precision to prevent the error from growing with the number of atoms in the simulation. *Single* precision mode should not be used without appropriate validation.

Quick Start for Experienced Users

LAMMPS should be built with the INTEL package installed. Simulations should be run with 1 MPI task per physical *core*, not *hardware thread*.

- Edit `src/MAKE/OPTIONS/Makefile.intel_cpu_intelmpi` as necessary.
- Set the environment variable `KMP_BLOCKTIME=0`
- `-pk intel 0 omp $t -sf intel` added to LAMMPS command-line
- `$t` should be 2 for Intel Xeon CPUs
- For some of the simple 2-body potentials without long-range electrostatics, performance and scalability can be better with the `newton off` setting added to the input script
- For simulations on higher node counts, add `processors * * * grid numa` to the beginning of the input script for better scalability
- If using `kspace_style pppm` in the input script, add `kspace_modify diff ad` for better performance

For simulations using `kspace_style pppm` on Intel CPUs supporting AVX-512:

- Add `kspace_modify diff ad` to the input script
- The command-line option should be changed to `-pk intel 0 omp $r lrt yes -sf intel` where `$r` is the number of threads minus 1.
- Do not use thread affinity (set `KMP_AFFINITY=none`)
- The `newton off` setting may provide better scalability

Required hardware/software

When using Intel compilers version 16.0 or later is required.

Although any compiler can be used with the INTEL package, currently, vectorization directives are disabled by default when not using Intel compilers due to lack of standard support and observations of decreased performance. The OpenMP standard now supports directives for vectorization and we plan to transition the code to this standard once it is available in most compilers. We expect this to allow improved performance and support with other compilers.

Notes about Simultaneous Multithreading

Modern CPUs often support Simultaneous Multithreading (SMT). On Intel processors, this is called Hyper-Threading (HT) technology. SMT is hardware support for running multiple threads efficiently on a single core. *Hardware threads* or *logical cores* are often used to refer to the number of threads that are supported in hardware. For example, the Intel Xeon E5-2697v4 processor is described as having 36 cores and 72 threads. This means that 36 MPI processes or OpenMP threads can run simultaneously on separate cores, but that up to 72 MPI processes or OpenMP threads can be running on the CPU without costly operating system context switches.

Molecular dynamics simulations will often run faster when making use of SMT. If a thread becomes stalled, for example because it is waiting on data that has not yet arrived from memory, another thread can start running so that the CPU pipeline is still being used efficiently. Although benefits can be seen by launching a MPI task for every hardware thread, for multinode simulations, we recommend that OpenMP threads are used for SMT instead, either with the INTEL package, *OPENMP package*, or *KOKKOS package*. In the example above, up to 36X speedups can be observed by using all 36 physical cores with LAMMPS. By using all 72 hardware threads, an additional 10-30% performance gain can be achieved.

The BIOS on many platforms allows SMT to be disabled, however, we do not recommend this on modern processors as there is little to no benefit for any software package in most cases. The operating system will report every hardware

thread as a separate core allowing one to determine the number of hardware threads available. On Linux systems, this information can normally be obtained with:

```
cat /proc/cpuinfo
```

Building LAMMPS with the INTEL package

See the [Build extras](#) page for instructions. Some additional details are covered here.

For building with make, several example Makefiles for building with the Intel compiler are included with LAMMPS in the `src/MAKE/OPTIONS/` directory:

```
Makefile.intel_cpu_intelmpi  # Intel Compiler, Intel MPI
Makefile.intel_cpu_mpic      # Intel Compiler, MPICH
Makefile.intel_cpu_openmpi    # Intel Compiler, OpenMPI
```

For users with recent installations of Intel Parallel Studio, the process can be as simple as:

```
make yes-intel
source /opt/intel/parallel_studio_xe_2016.3.067/psxevars.sh
# or psxevars.csh for C-shell
make intel_cpu_intelmpi
```

The general requirements for Makefiles with the INTEL package are as follows. When using Intel compilers, `-restrict` is required and `-qopenmp` is highly recommended for `CCFLAGS` and `LINKFLAGS`. `CCFLAGS` should include `-DLMP_INTEL_USELRT` (unless POSIX Threads are not supported in the build environment) and `-DLMP_USE_MKL_RNG` (unless Intel Math Kernel Library (MKL) is not available in the build environment). For Intel compilers, `LIB` should include `-ltbbmalloc` or if the library is not available, `-DLMP_INTEL_NO_TBB` can be added to `CCFLAGS`. Other recommended `CCFLAG` options for best performance are `-O2 -fno-alias -ansi-alias -qoverride-limits fp-model fast=2 -no-prec-div`.

Note

See the `src/INTEL/README` file for additional flags that might be needed for best performance on Intel server processors code-named “Skylake”.

Note

The vectorization and math capabilities can differ depending on the CPU. For Intel compilers, the `-x` flag specifies the type of processor for which to optimize. `-xHost` specifies that the compiler should build for the processor used for compiling. For fourth generation Intel Xeon (v4/Broadwell) processors, `-xCORE-AVX2` should be used. For older Intel Xeon processors, `-xAVX` will perform best in general for the different simulations in LAMMPS. The default in most of the example Makefiles is to use `-xHost`, however this should not be used when cross-compiling.

Running LAMMPS with the INTEL package

Running LAMMPS with the INTEL package is similar to normal use with the exceptions that one should 1) specify that LAMMPS should use the INTEL package, 2) specify the number of OpenMP threads, and 3) optionally specify the specific LAMMPS styles that should use the INTEL package. 1) and 2) can be performed from the command-line or by editing the input script. 3) requires editing the input script. Advanced performance tuning options are also described below to get the best performance.

When running on a single node, best performance is normally obtained by using 1 MPI task per physical core and additional OpenMP threads with SMT. For Intel Xeon processors, 2 OpenMP threads should be used for SMT. In cases where the user specifies that LRT mode is used (described below), 1 or 3 OpenMP threads should be used. For multi-node runs, using 1 MPI task per physical core will often perform best, however, depending on the machine and scale, users might get better performance by decreasing the number of MPI tasks and using more OpenMP threads. For performance, the product of the number of MPI tasks and OpenMP threads should not exceed the number of available hardware threads in almost all cases.

Run with the INTEL package from the command-line

To enable INTEL optimizations for all available styles used in the input script, the `-sf intel` *command-line switch* can be used without any requirement for editing the input script. This switch will automatically append “intel” to styles that support it. It also invokes a default command: *package intel 1*. This package command is used to set options for the INTEL package. The default package command will specify that INTEL calculations are performed in mixed precision and that the number of OpenMP threads is specified by the `OMP_NUM_THREADS` environment variable.

You can specify different options for the INTEL package by using the `-pk intel` *command-line switch* with key-word/value pairs as specified in the documentation. Common options to the INTEL package include *omp* to override any `OMP_NUM_THREADS` setting and specify the number of OpenMP threads, *mode* to set the floating-point precision mode, and *lrt* to enable Long-Range Thread mode as described below. See the *package intel* command for details, including the default values used for all its options if not specified, and how to set the number of OpenMP threads via the `OMP_NUM_THREADS` environment variable if desired.

Examples (see documentation for your MPI/Machine for differences in launching MPI applications):

```
# 2 nodes, 36 MPI tasks/node, $OMP_NUM_THREADS OpenMP Threads
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script

# use 2 OpenMP threads for each task, use double precision
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script \
    -pk intel 0 omp 2 mode double
```

Or run with the INTEL package by editing an input script

As an alternative to adding command-line arguments, the input script can be edited to enable the INTEL package. This requires adding the *package intel* command to the top of the input script. For the second example above, this would be:

```
package intel 0 omp 2 mode double
```

To enable the INTEL package only for individual styles, you can add an “intel” suffix to the individual style, e.g.:

```
pair_style lj/cut/intel 2.5
```

Alternatively, the *suffix intel* command can be added to the input script to enable INTEL styles for the commands that follow in the input script.

Tuning for Performance

Note

The INTEL package will perform better with modifications to the input script when *PPPM* is used: *kspace_modify diff ad* should be added to the input script.

Long-Range Thread (LRT) mode is an option to the *package intel* command that can improve performance when using *PPPM* for long-range electrostatics on processors with SMT. It generates an extra pthread for each MPI task. The

thread is dedicated to performing some of the PPPM calculations and MPI communications. This feature requires setting the pre-processor flag `-DLMP_INTEL_USELRT` in the makefile when compiling LAMMPS. It is unset in the default makefiles (`Makefile.mpi` and `Makefile.serial`) but it is set in all makefiles tuned for the INTEL package. On Intel Xeon processors, using this mode might result in better performance when using multiple nodes, depending on the specific machine configuration. To enable LRT mode, specify that the number of OpenMP threads is one less than would normally be used for the run and add the `lrt yes` option to the `-pk` command-line suffix or “package intel” command. For example, if a run would normally perform best with “`-pk intel 0 omp 4`”, instead use `-pk intel 0 omp 3 lrt yes`. When using LRT, you should set the environment variable `KMP_AFFINITY=none`.

Note

Changing the *newton* setting to off can improve performance and/or scalability for simple 2-body potentials such as *lj/cut* or when using LRT mode on processors supporting AVX-512.

Not all styles are supported in the INTEL package. You can mix the INTEL package with styles from the *OPT* package or the *OPENMP* package. Of course, this requires that these packages were installed at build time. This can be performed automatically by using `-sf hybrid intel opt` or `-sf hybrid intel omp` command-line options. Alternatively, the “opt” and “omp” suffixes can be appended manually in the input script. For the latter, the *package omp* command must be in the input script or the `-pk omp Nt` *command-line switch* must be used where *Nt* is the number of OpenMP threads. The number of OpenMP threads should not be set differently for the different packages. Note that the *suffix hybrid intel omp* command can also be used within the input script to automatically append the “omp” suffix to styles when INTEL styles are not available.

Note

For simulations on higher node counts, add *processors * * * grid numa* to the beginning of the input script for better scalability.

When running on many nodes, performance might be better when using fewer OpenMP threads and more MPI tasks. This will depend on the simulation and the machine. Using the *verlet/split* run style might also give better performance for simulations with *PPPM* electrostatics. Note that this is an alternative to LRT mode and the two cannot be used together.

Restrictions

None of the pair styles in the INTEL package currently support the “inner”, “middle”, “outer” options for rRESPA integration via the *run_style respa* command; only the “pair” option is supported.

7.4.3 KOKKOS package

Kokkos is a templated C++ library that provides abstractions to allow a single implementation of an application kernel (e.g. a pair style) to run efficiently on different kinds of hardware, such as GPUs, Intel Xeon Phis, or many-core CPUs. Kokkos maps the C++ kernel onto different back end languages such as CUDA, OpenMP, or Pthreads. The Kokkos library also provides data abstractions to adjust (at compile time) the memory layout of data structures like 2d and 3d arrays to optimize performance on different hardware. For more information on Kokkos, see [the Kokkos GitHub page](#).

The LAMMPS KOKKOS package contains versions of pair, fix, and atom styles that use data structures and macros provided by the Kokkos library, which is included with LAMMPS in `/lib/kokkos`. The KOKKOS package was developed primarily by Christian Trott (Sandia) and Stan Moore (Sandia) with contributions of various styles by others, including Sikandar Mashayak (UIUC), Ray Shan (Sandia), and Dan Ibanez (Sandia). For more information on developing using Kokkos abstractions see the [Kokkos Wiki](#).

Note

The Kokkos library is under active development and tracking the availability of accelerator hardware, so is the KOKKOS package in LAMMPS. This means that only a certain range of versions of the Kokkos library are compatible with the KOKKOS package of a certain range of LAMMPS versions. For that reason LAMMPS comes with a bundled version of the Kokkos library that has been validated on multiple platforms and may contain selected back-ported bug fixes from upstream Kokkos versions. While it is possible to build LAMMPS with an external version of Kokkos, it is untested and may result in incorrect execution or crashes.

Kokkos currently provides full support for 4 modes of execution (per MPI task). These are Serial (MPI-only for CPUs and Intel Phi), OpenMP (threading for many-core CPUs and Intel Phi), CUDA (for NVIDIA GPUs) and HIP (for AMD GPUs). Additional modes (e.g. OpenMP target, Intel data center GPUs) are under development. You choose the mode at build time to produce an executable compatible with a specific hardware.

The following compatibility notes have been last updated for LAMMPS version 11 February 2026 and its bundled Kokkos library version 5.0.2.

C++20 support

Kokkos requires using a compiler that supports the C++20 standard. For some compilers, it may be necessary to add a flag to enable C++20 support. For example, the GNU compiler uses the `-std=c++20` flag. For a list of compilers that have been tested with the Kokkos library, see the [requirements document of the Kokkos Wiki](#).

NVIDIA CUDA support

To build with Kokkos support for NVIDIA GPUs, the NVIDIA CUDA toolkit software version 12.2 or later must be installed on your system. See the discussion for the [GPU package](#) for details of how to check and do this.

AMD ROCm (HIP) support

To build with Kokkos support for AMD GPUs, the AMD ROCm toolkit software version 6.2.0 or later must be installed on your system.

i Intel Data Center GPU support

Support for Kokkos with Intel Data Center GPU accelerators (formerly known under the code name “Ponte Vecchio”) in LAMMPS is still a work in progress. Minimum required version is the Intel LLVM (not classic) compiler version 2024.1. The LAMMPS developers do not regularly test the status of this, so please contact the LAMMPS developers if you run into problems.

i CUDA and MPI library compatibility

Kokkos with CUDA currently implicitly assumes that the MPI library is GPU-aware. This is not always the case, especially when using pre-compiled MPI libraries provided by a Linux distribution. This is not a problem when using only a single GPU with a single MPI rank. When running with multiple MPI ranks, you may see segmentation faults without GPU-aware MPI support. These can be avoided by adding the flags `-pk kokkos gpu/aware off` to the LAMMPS command-line or by using the command `package kokkos gpu/aware off` in the input file.

i Using multiple MPI ranks per GPU

Unlike with the GPU package, there are limited benefits from using multiple MPI processes per GPU with KOKKOS. But when doing this it is **required** to enable CUDA MPS (Multi-Process Service :: GPU Deployment and Management Documentation) to get acceptable performance.

Building LAMMPS with the KOKKOS package

See the *Build extras* page for instructions.

Running LAMMPS with the KOKKOS package

All Kokkos operations occur within the context of an individual MPI task running on a single node of the machine. The total number of MPI tasks used by LAMMPS (one or multiple per compute node) is set in the usual manner via the `mpirun` or `mpiexec` commands, and is independent of Kokkos. E.g. the `mpirun` command in OpenMPI does this via its `-np` and `-npn` switches. Ditto for MPICH via `-np` and `-ppn`.

Running on a multicore CPU

Here is a quick overview of how to use the KOKKOS package for CPU acceleration, assuming one or more 16-core nodes.

```
# 1 node, 16 MPI tasks/node, no multi-threading
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk -in in.lj

# 2 nodes, 1 MPI task/node, 16 threads/task
mpirun -np 2 -ppn 1 lmp_kokkos_omp -k on t 16 -sf kk -in in.lj

# 1 node, 2 MPI tasks/node, 8 threads/task
mpirun -np 2 lmp_kokkos_omp -k on t 8 -sf kk -in in.lj

# 8 nodes, 4 MPI tasks/node, 4 threads/task
mpirun -np 32 -ppn 4 lmp_kokkos_omp -k on t 4 -sf kk -in in.lj
```

To run using the KOKKOS package, use the `-k on`, `-sf kk` and `-pk kokkos` *command-line switches* in your `mpirun`

command. You must use the `-k on` *command-line switch* to enable the KOKKOS package. It takes additional arguments for hardware settings appropriate to your system. For OpenMP use:

```
-k on t Nt
```

The `t Nt` option specifies how many OpenMP threads per MPI task to use with a node. The default is `Nt = 1`, which is MPI-only mode. Note that the product of MPI tasks * OpenMP threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer. If Hyper-Threading (HT) is enabled, then the product of MPI tasks * OpenMP threads/task should not exceed the physical number of cores * hardware threads. The `-k on` switch also issues a `package kokkos` command (with no additional arguments) which sets various KOKKOS options to default values, as discussed on the *package* command doc page.

The `-sf kk` *command-line switch* will automatically append the `"/kk"` suffix to styles that support it. In this manner no modification to the input script is needed. Alternatively, one can run with the KOKKOS package by editing the input script as described below.

Note

When using ONLY a single OpenMP thread, the Kokkos Serial back end (i.e. `-D Kokkos_ENABLE_SERIAL=yes`) will give better performance than the OpenMP back end (i.e. `-D Kokkos_ENABLE_OPENMP=yes`) because some of the overhead to make the code thread-safe is removed.

Note

Use the `-pk kokkos` *command-line switch* to change the default *package kokkos* options. See its doc page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
# Newton on, Half neighbor list, non-threaded comm
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk \
    -pk kokkos newton on neigh half comm no -in in.lj
```

If the *newton* command is used in the input script, it can also override the Newton flag defaults.

For half neighbor lists and OpenMP, the KOKKOS package uses data duplication (i.e. thread-private arrays) by default to avoid thread-level write conflicts in the force arrays (and other data structures as necessary). Data duplication is typically fastest for small numbers of threads (i.e. 8 or less) but does increase memory footprint and is not scalable to large numbers of threads. An alternative to data duplication is to use thread-level atomic operations which do not require data duplication. The use of atomic operations can be enforced by compiling LAMMPS with the `-DLMP_KOKKOS_USE_ATOMICS` pre-processor flag. Most but not all Kokkos-enabled pair_styles support data duplication. Alternatively, full neighbor lists avoid the need for duplication or atomic operations but require more compute operations per atom. When using the Kokkos Serial back end or the OpenMP back end with a single thread, no duplication or atomic operations are used. For CUDA and half neighbor lists, the KOKKOS package always uses atomic operations.

CPU Cores, Sockets and Thread Affinity

When using multi-threading, it is important for performance to bind both MPI tasks to physical cores, and threads to physical cores, so they do not migrate during a simulation.

If you are not certain MPI tasks are being bound (check the defaults for your MPI installation), binding can be forced with these flags:

Here is a quick overview of how to use the KOKKOS package for the Intel Knight's Landing (KNL) Xeon Phi:

Examples of mpirun commands that follow these rules are shown below.

The `-np` setting of the `mpirun` command sets the number of MPI tasks/node. The `-k on t Nt` command-line switch sets the number of threads/task as `Nt`. The product of these two values should be `N`, i.e. 256 or 264.

The default for the *package kokkos* command when running on KNL is to use “half” neighbor lists and set the Newton flag to “on” for both pairwise and bonded interactions. This will typically be best for many-body potentials. For simpler pairwise potentials, it may be faster to use a “full” neighbor list with Newton flag to “off”. Use the `-pk kokkos` *command-line switch* to change the default *package kokkos* options. See its documentation page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

(continues on next page)

(continued from previous page)

```
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk \
      -pk kokkos newton off neigh full comm no -in in.lj
```

Note

MPI tasks and threads should be bound to cores as described above for CPUs.

Note

To build with Kokkos support for Intel Xeon Phi co-processors such as Knight's Corner (KNC), your system must be configured to use them in "native" mode, not "offload" mode like the INTEL package supports.

Running on GPUs

Use the `-k command-line switch` to specify the number of GPUs per node. Typically the `-np` setting of the `mpirun` command should set the number of MPI tasks/node to be equal to the number of physical GPUs on the node. You can assign multiple MPI tasks to the same GPU with the KOKKOS package, but this is usually only faster if some portions of the input script have not been ported to use Kokkos. In this case, also packing/unpacking communication buffers on the host may give speedup (see the KOKKOS *package* command). Using CUDA MPS is recommended in this scenario.

Using a GPU-aware MPI library is highly recommended. GPU-aware MPI use can be avoided by using `-pk kokkos gpu/aware off`. As above for multicore CPUs (and no GPU), if N is the number of physical cores/node, then the number of MPI tasks/node should not exceed N.

```
-k on g Ng
```

Here are examples of how to use the KOKKOS package for GPUs, assuming one or more nodes, each with two GPUs:

```
# 1 node, 2 MPI tasks/node, 2 GPUs/node
mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj

# 16 nodes, 2 MPI tasks/node, 2 GPUs/node (32 GPUs total)
mpirun -np 32 -ppn 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj
```

Note

The default for the *package kokkos* command when running on GPUs is to use "full" neighbor lists and set the Newton flag to "off" for both pairwise and bonded interactions, along with threaded communication. When running on Maxwell or Kepler GPUs, this will typically be best. For Pascal GPUs and beyond, using "half" neighbor lists and setting the Newton flag to "on" may be faster. For many pair styles, setting the neighbor binsize equal to twice the CPU default value will give speedup, which is the default when running on GPUs. Use the `-pk kokkos command-line switch` to change the default *package kokkos* options. See its documentation page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
# Newton on, half neighbor list, set binsize = neighbor ghost cutoff
mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk \
      -pk kokkos newton on neigh half binsize 2.8 -in in.lj
```

Note

The default binsize for *atom sorting* on GPUs is equal to the default CPU neighbor binsize (i.e. 2x smaller than the default GPU neighbor binsize). When running simple pair-wise potentials like Lennard Jones on GPUs, using a 2x larger binsize for atom sorting (equal to the default GPU neighbor binsize) and a more frequent sorting than default (e.g. sorting every 100 time steps instead of 1000) may improve performance.

Note

When running on GPUs with many MPI ranks (tens of thousands and more), the creation of the atom map (required for molecular systems) on the GPU can slow down significantly or run out of GPU memory and thus slow down the whole calculation or cause a crash. You can use the `-pk kokkos atom/map no` *command-line switch* of the *package kokkos atom/map no* command to create the atom map on the CPU instead.

Note

When using a GPU, you will achieve the best performance if your input script does not use fix or compute styles which are not yet Kokkos-enabled. This allows data to stay on the GPU for multiple timesteps, without being copied back to the host CPU. Invoking a non-Kokkos fix or compute, or performing I/O for *thermo* or *dump* output will cause data to be copied back to the CPU incurring a performance penalty.

Note

To get an accurate timing breakdown between time spend in pair, kspace, etc., you must set the environment variable `CUDA_LAUNCH_BLOCKING=1`. However, this will reduce performance and is not recommended for production runs.

Troubleshooting segmentation faults on GPUs

As noted above, KOKKOS by default assumes that the MPI library is GPU-aware. This is not always the case and can lead to segmentation faults when using more than one MPI process. Normally, LAMMPS will print a warning like “Turning off GPU-aware MPI since it is not detected”, or an error message like “Kokkos with GPU-enabled back end assumes GPU-aware MPI is available”, OR a **segmentation fault**. To confirm that a segmentation fault is caused by this, you can turn off the GPU-aware assumption via the *package kokkos command* or the corresponding command-line flag.

If you still get a segmentation fault, despite running with only one MPI process or using the command-line flag to turn off expecting a GPU-aware MPI library, then using the CMake compile setting `-DKokkos_ENABLE_DEBUG=on` will generate useful output that can be passed to the LAMMPS developers for further debugging.

Troubleshooting memory allocation on GPUs

Kokkos Tools provides a set of lightweight profiling and debugging utilities, which interface with instrumentation hooks (eg. *space-time-stack*) built directly into the Kokkos runtime. After compiling a dynamic LAMMPS library, you then have to set the environment variable `KOKKOS_TOOLS_LIBS` before executing your LAMMPS Kokkos run. Example:

```
export KOKKOS_TOOLS_LIBS=${HOME}/kokkos-tools/src/tools/memory-events/kp_memory_event.so
mpirun -np 4 lmp_kokkos_cuda_openmpi -in in.lj -k on g 4 -sf kk
```

Starting with the NVIDIA Pascal GPU architecture, CUDA supports “Unified Virtual Memory” (UVM) which enables

allocating more memory than a GPU possesses by also using memory on the host CPU and then CUDA will transparently move data between CPU and GPU as needed. The resulting LAMMPS performance depends on [memory access pattern](#), [data residency](#), and [GPU memory oversubscription](#). The CMake option `-DKokkos_ENABLE_CUDA_UVM=on` enables using *UVM with Kokkos* when compiling LAMMPS.

Run with the KOKKOS package by editing an input script

Alternatively the effect of the `-sf` or `-pk` switches can be duplicated by adding the *package kokkos* or *suffix kk* commands to your input script.

The discussion above for building LAMMPS with the KOKKOS package, the `mpirun` or `mpiexec` command, and setting appropriate thread properties are the same.

You must still use the `-k` on *command-line switch* to enable the KOKKOS package, and specify its additional arguments for hardware options appropriate to your system, as documented above.

You can use the *suffix kk* command, or you can explicitly add a “kk” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/kk 2.5
```

You only need to use the *package kokkos* command if you wish to change any of its option defaults, as set by the “-k on” *command-line switch*.

Using OpenMP threading and CUDA together:

With the KOKKOS package, both OpenMP multi-threading and GPUs can be compiled and used together in a few special cases. You need to enable both features as it is done in the `kokkos-cuda.cmake` CMake preset file.

```
cmake -DKokkos_ENABLE_CUDA=yes -DKokkos_ENABLE_OPENMP=yes ../cmake
```

The suffix “/kk” is equivalent to “/kk/device”, and for Kokkos CUDA, using the `-sf kk` in the command-line gives the default CUDA version everywhere. However, if the “/kk/host” suffix is added to a specific style in the input script, the Kokkos OpenMP (CPU) version of that specific style will be used instead. Set the number of OpenMP threads as `t Nt` and the number of GPUs as `g Ng`

```
-k on t Nt g Ng
```

For example, the command to run with 1 GPU and 8 OpenMP threads is then:

```
mpiexec -np 1 lmp_kokkos_cuda_openmpi -in in.lj -k on g 1 t 8 -sf kk
```

Conversely, if the `-sf kk/host` is used in the command-line and then the “/kk” or “/kk/device” suffix is added to a specific style in your input script, then only that specific style will run on the GPU while everything else will run on the CPU in OpenMP mode. Note that the execution of the CPU and GPU styles will NOT overlap, except for a special case:

A `kspace` style and/or molecular topology (bonds, angles, etc.) running on the host CPU can overlap with a pair style running on the GPU. First compile with `--default-stream per-thread` added to `-D CMAKE_CXX_FLAGS` when configuring with CMake. Then explicitly use the “/kk/host” suffix for `kspace` and bonds, angles, etc. in the input file and the “kk” suffix (equal to “kk/device”) on the command-line. Also make sure the environment variable `CUDA_LAUNCH_BLOCKING` is not set to “1” so CPU/GPU overlap can occur.

Performance to expect

The performance of KOKKOS running in different modes is a function of your hardware, which KOKKOS-enable styles are used, and the problem size.

Generally speaking, the following rules of thumb apply:

- When running on CPUs only, with a single thread per MPI task, performance of a KOKKOS style is somewhere between the standard (un-accelerated) styles (MPI-only mode), and those provided by the OPENMP package. However the difference between all 3 is small (less than 20%).
- When running on CPUs only, with multiple threads per MPI task, performance of a KOKKOS style is a bit slower than the OPENMP package.
- When running large number of atoms per GPU, KOKKOS is typically faster than the GPU package when both are compiled for double precision.
- When running on Intel Phi hardware, KOKKOS is not as fast as the INTEL package, which is optimized for x86 hardware (not just from Intel) and compilation with the Intel compilers.
- The KOKKOS package by default assumes that you are using exactly one MPI rank per GPU. When trying to use multiple MPI ranks per GPU it is mandatory to enable [CUDA Multi-Process Service \(MPS\)](#) to get good performance. In this case it is better to not use all available MPI ranks in order to avoid competing with the MPS daemon for CPU resources.

See the [Benchmark](#) page of the LAMMPS website for performance of the KOKKOS package on different hardware.

Advanced Kokkos options

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. They are explained on the [KOKKOS section of the build extras](#) doc page,

7.4.4 OPENMP package

The OPENMP package was developed by Axel Kohlmeyer at Temple University. It provides optimized and multi-threaded versions of many pair styles, nearly all bonded styles (bond, angle, dihedral, improper), several Kspace styles, and a few fix styles. It uses the OpenMP interface for multi-threading, but can also be compiled without OpenMP support, providing optimized serial styles in that case.

Required hardware/software

To enable multi-threading, your compiler must support the OpenMP interface. You should have one or more multicore CPUs, as multiple threads can only be launched by each MPI task on the local node (using shared memory).

Building LAMMPS with the OPENMP package

See the [Build extras](#) page for instructions.

Run with the OPENMP package from the command-line

These examples assume one or more 16-core nodes.

```
# 1 MPI task, 16 threads according to OMP_NUM_THREADS
env OMP_NUM_THREADS=16 lmp_omp -sf omp -in in.script

# 1 MPI task, no threads, optimized kernels
lmp_mpi -sf omp -in in.script

# 4 MPI tasks, 4 threads/task
```

(continues on next page)

(continued from previous page)

```
mpirun -np 4 lmp_omp -sf omp -pk omp 4 -in in.script
# 8 nodes, 4 MPI tasks/node, 4 threads/task
mpirun -np 32 -ppn 4 lmp_omp -sf omp -pk omp 4 -in in.script
```

The `mpirun` or `mpiexec` command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the `mpirun` command in MPICH does this via its `-np` and `-ppn` switches. Ditto for OpenMPI via `-np` and `-npnnode`.

You need to choose how many OpenMP threads per MPI task will be used by the OPENMP package. Note that the product of MPI tasks * threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer.

As in the lines above, use the `-sf omp command-line switch`, which will automatically append “omp” to styles that support it. The `-sf omp` switch also issues a default `package omp 0` command, which will set the number of threads per MPI task via the `OMP_NUM_THREADS` environment variable.

You can also use the `-pk omp Nt command-line switch`, to explicitly set `Nt` = # of OpenMP threads per MPI task to use, as well as additional options. Its syntax is the same as the `package omp` command whose page gives details, including the default values used if it is not specified. It also gives more details on how to set the number of threads via the `OMP_NUM_THREADS` environment variable.

Or run with the OPENMP package by editing an input script

The discussion above for the `mpirun` or `mpiexec` command, MPI tasks/node, and threads/MPI task is the same.

Use the `suffix omp` command, or you can explicitly add an “omp” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/omp 2.5
```

You must also use the `package omp` command to enable the OPENMP package. When you do this you also specify how many threads per MPI task to use. The command page explains other options and how to set the number of threads via the `OMP_NUM_THREADS` environment variable.

Speed-up to expect

Depending on which styles are accelerated, you should look for a reduction in the “Pair time”, “Bond time”, “KSpace time”, and “Loop time” values printed at the end of a run.

You may see a small performance advantage (5 to 20%) when running a OPENMP style (in serial or parallel) with a single thread per MPI task, versus running standard LAMMPS with its standard un-accelerated styles (in serial or all-MPI parallelization with 1 task/core). This is because many of the OPENMP styles contain similar optimizations to those used in the OPT package, described in [the OPT package](#) doc page.

With multiple threads/task, the optimal choice of number of MPI tasks/node and OpenMP threads/task can vary a lot and should always be tested via benchmark runs for a specific simulation running on a specific machine, paying attention to guidelines discussed in the next subsection.

A description of the multi-threading strategy used in the OPENMP package and some performance examples are [pre-sented here](#).

Guidelines for best performance

For many problems on current generation CPUs, running the OPENMP package with a single thread/task is faster than running with multiple threads/task. This is because the MPI parallelization in LAMMPS is often more efficient than multi-threading as implemented in the OPENMP package. The parallel efficiency (in a threaded sense) also varies for different OPENMP styles.

Using multiple threads/task can be more effective under the following circumstances:

- Individual compute nodes have a significant number of CPU cores but the CPU itself has limited memory bandwidth, e.g. for Intel Xeon 53xx (Clovertown) and 54xx (Harpertown) quad-core processors. Running one MPI task per CPU core will result in significant performance degradation, so that running with 4 or even only 2 MPI tasks per node is faster. Running in hybrid MPI+OpenMP mode will reduce the inter-node communication bandwidth contention in the same way, but offers an additional speedup by utilizing the otherwise idle CPU cores.
- The interconnect used for MPI communication does not provide sufficient bandwidth for a large number of MPI tasks per node. For example, this applies to running over gigabit ethernet or on Cray XT4 or XT5 series supercomputers. As in the aforementioned case, this effect worsens when using an increasing number of nodes.
- The system has a spatially inhomogeneous particle density which does not map well to the *domain decomposition scheme* or *load-balancing* options that LAMMPS provides. This is because multi-threading achieves parallelism over the number of particles, not via their distribution in space.
- A machine is being used in “capability mode”, i.e. near the point where MPI parallelism is maxed out. For example, this can happen when using the *PPPM solver* for long-range electrostatics on large numbers of nodes. The scaling of the KSpace calculation (see the *kpace_style* command) becomes the performance-limiting factor. Using multi-threading allows less MPI tasks to be invoked and can speed-up the long-range solver, while increasing overall performance by parallelizing the pairwise and bonded calculations via OpenMP. Likewise, additional speedup can sometimes be achieved by increasing the length of the Coulombic cutoff and thus reducing the work done by the long-range solver. Using the *run_style verlet/split* command, which is compatible with the OPENMP package, is an alternative way to reduce the number of MPI tasks assigned to the KSpace calculation.

Additional performance tips are as follows:

- The best parallel efficiency from *omp* styles is typically achieved when there is at least one MPI task per physical CPU chip, i.e. socket or die.
- It is usually most efficient to restrict threading to a single socket, i.e. use one or more MPI task per socket.
- NOTE: By default, several current MPI implementations use a processor affinity setting that restricts each MPI task to a single CPU core. Using multi-threading in this mode will force all threads to share the one core and thus is likely to be counterproductive. Instead, binding MPI tasks to a (multicore) socket, should solve this issue.

Restrictions

None.

7.4.5 OPT package

The OPT package was developed by James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technologies). It contains a handful of pair styles whose compute() methods were rewritten in C++ templated form to reduce the overhead due to if tests and other conditional code.

Required hardware/software

Any hardware. Any compiler.

Building LAMMPS with the OPT package

See the *Build extras* page for instructions.

Run with the OPT package from the command-line

```

lmp_mpi -sf opt -in in.script           # run in serial
mpirun -np 4 lmp_mpi -sf opt -in in.script # run in parallel

```

Use the “-sf opt” *command-line switch*, which will automatically append “opt” to styles that support it.

Or run with the OPT package by editing an input script

Use the *suffix opt* command, or you can explicitly add an “opt” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/opt 2.5
```

Speed-up to expect

You should see a reduction in the “Pair time” value printed at the end of a run. On most machines for reasonable problem sizes, it will be a 5 to 20% savings.

Guidelines for best performance

Just try out an OPT pair style to see how it performs.

Restrictions

None.

Inverting this list, LAMMPS currently has acceleration support for three kinds of hardware, via the listed packages:

Many-core CPUs	<i>INTEL, KOKKOS, OPENMP, OPT</i> packages
GPUs	<i>GPU, KOKKOS</i> packages
Intel AVX	<i>INTEL, KOKKOS</i> packages

Which package is fastest for your hardware may depend on the size problem you are running and what commands (accelerated and non-accelerated) are invoked by your input script. While these doc pages include performance guidelines, there is no substitute for trying out the different packages appropriate to your hardware.

Any accelerated style has the same name as the corresponding standard style, except that a suffix is appended. Otherwise, the syntax for the command that uses the style is identical, their functionality is the same, and the numerical results it produces should also be the same, except for precision and round-off effects.

For example, all of these styles are accelerated variants of the Lennard-Jones *pair_style lj/cut*:

- *pair_style lj/cut/gpu*
- *pair_style lj/cut/intel*
- *pair_style lj/cut/kk*
- *pair_style lj/cut/omp*
- *pair_style lj/cut/opt*

To see what accelerate styles are currently available for a particular style, find the style name in the *Commands* style pages (fix,compute,pair,etc) and see what suffixes are listed (g,i,k,o,t) with it. The doc pages for individual commands (e.g. *pair lj/cut* or *fix nve*) also list any accelerated variants available for that style.

To use an accelerator package in LAMMPS, and one or more of the styles it provides, follow these general steps. Details vary from package to package and are explained in the individual accelerator doc pages, listed above.

Configure LAMMPS to include the accelerator package	<i>Build LAMMPS with CMake</i> or <i>Build LAMMPS with make</i>
(Re-)Compile LAMMPS	<i>Build LAMMPS</i>
prepare and test a regular LAMMPS simulation	<code>lmp -in in.script; mpirun -np 32 lmp -in in.script</code>
enable specific accelerator support via <code>-k</code> on <i>command-line switch</i>	only needed for KOKKOS package
set any needed options for the package via <code>-pk</code> <i>command-line switch</i> or <i>package</i> command	only if defaults need to be changed
use accelerated styles in your input via <code>-sf</code> <i>command-line switch</i> or <i>suffix</i> command	<code>lmp_machine -in in.script -sf gpu</code>

This is discussed on the [Packages](#) and [extra Build info](#) doc pages, and its use is illustrated in the individual accelerator sections. Typically these steps only need to be done once, to create an executable that uses one or more accelerator packages.

Note

With a few exceptions, you can build a single LAMMPS executable with all its accelerator packages installed. Note however that the KOKKOS package requires you to choose one of its hardware options when building for a specific platform, e.g. the OpenMP, CUDA, HIP, or SYCL option for the KOKKOS package. Or the OpenCL, HIP, or CUDA option for the GPU package.

As mentioned above, the [Benchmark](#) page of the LAMMPS website gives performance results for the various accelerator packages for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

Here is a brief summary of what the various packages provide. Details are in the individual accelerator sections.

- Styles with a “gpu” suffix are part of the GPU package and can be run on Intel, NVIDIA, or AMD GPUs. The speed-up on a GPU depends on a variety of factors, discussed in the accelerator sections.
- Styles with an “intel” suffix are part of the INTEL package. These styles support vectorized single and mixed precision calculations, in addition to full double precision. In extreme cases, this can provide speedups over 3.5x on CPUs.
- Styles with a “kk” suffix are part of the KOKKOS package, and can be run using OpenMP on multicore CPUs or on an NVIDIA or AMD GPU. The speed-up depends on a variety of factors, as discussed on the KOKKOS accelerator page.
- Styles with an “omp” suffix are part of the OPENMP package and allow a pair-style to be run in multi-threaded mode using OpenMP. This can be useful on nodes with high-core counts when using less MPI processes than cores is advantageous, e.g. when running with PPPM so that FFTs are run on fewer MPI processors or when the many MPI tasks would overload the available bandwidth for communication.
- Styles with an “opt” suffix are part of the OPT package and typically speed-up the pairwise calculations of your simulation by 5-25% on a CPU.

The individual accelerator package doc pages explain:

- what hardware and software the accelerated package requires
- how to build LAMMPS with the accelerated package
- how to run with the accelerated package either via command-line switches or modifying the input script
- speed-ups to expect

- guidelines for best performance
- restrictions

7.5 Comparison of various accelerator packages

The next section compares and contrasts the various accelerator options, since there are multiple ways to perform OpenMP threading, run on GPUs, and optimize for vector units on CPUs.

All of these packages can accelerate a LAMMPS calculation taking advantage of hardware features, but they do it in different ways and acceleration is not always guaranteed.

As a consequence, for a particular simulation on specific hardware, one package may be faster than the other. We give some guidelines below, but the best way to determine which package is faster for your input script is to try multiple of them on your machine and experiment with available performance tuning settings. See the benchmarking section below for examples where this has been done.

Guidelines for using each package optimally:

- Both, the GPU and the KOKKOS package allows you to assign multiple MPI ranks (= CPU cores) to the same GPU. For the GPU package, this can lead to a speedup through better utilization of the GPU (by overlapping computation and data transfer) and more efficient computation of the non-GPU accelerated parts of LAMMPS through MPI parallelization, as all system data is maintained and updated on the host. For KOKKOS, there is less to no benefit from this, due to its different memory management model, which tries to retain data on the GPU.
- The GPU package moves per-atom data (coordinates, forces, and (optionally) neighbor list data, if not computed on the GPU) between the CPU and GPU at every timestep. The KOKKOS/CUDA package only does this on timesteps when a CPU calculation is required (e.g. to invoke a fix or compute that is non-GPU-ized). Hence, if you can formulate your input script to only use GPU-ized fixes and computes, and avoid doing I/O too often (thermo output, dump file snapshots, restart files), then the data transfer cost of the KOKKOS/CUDA package can be very low, causing it to run faster than the GPU package.
- The GPU package is often faster than the KOKKOS/CUDA package, when the number of atoms per GPU is on the smaller side. The crossover point, in terms of atoms/GPU at which the KOKKOS/CUDA package becomes faster depends strongly on the pair style.
- When using LAMMPS with multiple MPI ranks assigned to the same GPU, its performance depends to some extent on the available bandwidth between the CPUs and the GPU. This can differ significantly based on the available bus technology, capability of the host CPU and mainboard, the wiring of the buses and whether switches are used to increase the number of available bus slots, or if GPUs are housed in an external enclosure. This can become quite complex.
- To achieve significant acceleration through GPUs, both KOKKOS and GPU package require capable GPUs with fast on-device memory and efficient data transfer rates. This requests capable upper mid-level to high-end (desktop) GPUs. Using lower performance GPUs (e.g. on laptops) may result in a slowdown instead.
- For the GPU package, specifically when running in parallel with MPI, it is often more efficient to exclude the PPPM kspace style from GPU acceleration and instead run it - concurrently with a GPU accelerated pair style - on the CPU. This can often be easily achieved with placing a *suffix off* command before and a *suffix on* command after the *kspace_style pppm* command.
- The KOKKOS/OpenMP and OPENMP package have different thread management strategies, which should result in OPENMP being more efficient for a small number of threads with increasing overhead as the number of threads per MPI rank grows. The KOKKOS/OpenMP kernels have less overhead in that case, but have lower performance with few threads.
- The INTEL package contains many options and settings for achieving additional performance on Intel hardware (CPU and accelerator cards), but to unlock this potential, an Intel compiler is required. The package code will

compile with GNU gcc, but it will not be as efficient.

Differences between the GPU and KOKKOS packages:

- The GPU package accelerates only pair force, neighbor list, and (parts of) PPPM calculations (and runs the remaining force computations on the CPU concurrently). The KOKKOS package attempts to run most of the calculation on the GPU, but can transparently support non-accelerated code (with a performance penalty due to having data transfers between host and GPU).
- The list of which styles are accelerated by the GPU or KOKKOS package differs with some overlap.
- The GPU package requires neighbor lists to be built on the CPU when using hybrid pair styles, exclusion lists, or a triclinic simulation box.
- The GPU package benefits from running multiple MPI processes (2-8) per GPU to parallelize the non-GPU accelerated styles. The KOKKOS package usually not, especially when all parts of the calculation have KOKKOS support.
- The GPU package can be compiled for CUDA, HIP, or OpenCL and thus supports NVIDIA, AMD, and Intel GPUs well. On NVIDIA or AMD hardware, using native CUDA or HIP compilation, respectively, with either GPU or KOKKOS results in equal or better performance over OpenCL.
- OpenCL in the GPU package supports NVIDIA, AMD, and Intel GPUs at the *same time* and with the *same executable*. KOKKOS currently does not support OpenCL.
- Both the GPU package and the KOKKOS package support single precision floating point, mixed precision floating point, and double precision floating point math. This must be chosen at compile time. Using single or mixed precision (recommended) results in significantly improved performance on consumer GPUs for some loss in accuracy (which is rather small with mixed precision).
- Some pair styles (for example *snap*, *mliap* or *reaxff* in the KOKKOS package have seen extensive optimizations and specializations for GPUs and CPUs.

OPTIONAL PACKAGES

This section gives an overview of the optional packages included in the LAMMPS distribution that extend LAMMPS' functionality. Packages are groups of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. You can see the list of all packages and “make” commands to manage them by typing “make package” from within the src directory of the LAMMPS distribution. The list of packages that are included in a specific LAMMPS executable can be displayed by *running LAMMPS with the “-h” flag*.

The *Build package* page gives general info on how to install and uninstall packages as part of the LAMMPS build process.

External packages

In addition to packages included with LAMMPS there also are packages that are distributed independently and separate from LAMMPS. Some of them are part of a modified fork of the LAMMPS repository, others are add-on files that have to be integrated into the LAMMPS distribution first. The LAMMPS developers have in most cases no direct knowledge of those packages and which new commands and modifications to LAMMPS they contain. Since LAMMPS is *open source under the GPL-v2 license*, there is no requirement to tell us about it or integrated them back into LAMMPS. Thus you have to contact the developers of those individual packages in case of questions or problems.

As the LAMMPS internal code structure is sometimes changing, those external packages may need to be updated to remain compatible with the latest LAMMPS versions. The LAMMPS Programmer's Guide part contains a section with *notes for updating code written for older LAMMPS versions* which explains significant changes and how to update the corresponding code.

Below is the list of packages that are included in the LAMMPS distribution. The link for each package name gives more details.

Packages are supported by either the LAMMPS developers or the contributing authors. They should all be written in a syntax and style consistent with the rest of LAMMPS.

The “Examples” column is a subdirectory in the examples directory of the distribution which has one or more input scripts that use the package. E.g. `peptide` refers to the `examples/peptide` directory; `PACKAGES/atc` refers to the `examples/PACKAGES/atc` directory. The “Lib” column indicates whether an extra library is needed to build and use the package:

- no = no library
- sys = system library: you likely have it on your machine
- int = internal library: provided with LAMMPS, but you may need to build it
- ext = external library: you will need to download and install it on your machine

Package	Description	Doc page	Examples	Lib
<i>ADIOS</i>	dump output via ADIOS	<i>dump adios</i>	PACKAGES/adios	ext

8.1 Package details

Here is a brief description of all packages in LAMMPS. It lists authors (if applicable) and summarizes the package contents. It has specific instructions on how to install the package, including, if necessary, info on how to download or build any extra library it requires. It also gives links to documentation, example scripts, and pictures/movies (if available) that illustrate use of the package.

The majority of packages can be included in a LAMMPS build with a single setting (`-D PKG_<NAME>=on` for CMake) or command (`make yes-<name>` for make). See the [Build package](#) page for more info. A few packages may require additional steps; this is indicated in the descriptions below. The [Build extras](#) page gives those details.

Note

To see the complete list of commands a package adds to LAMMPS, you can examine the files in its `src` directory, e.g. `ls src/GRANULAR`. Files with names that start with `fix`, `compute`, `atom`, `pair`, `bond`, `angle`, etc correspond to commands with the same style name as contained in the file name.

<i>ADIOS</i>	<i>AMOEBA</i>	<i>APIP</i>	<i>ASPHERE</i>	<i>BOCS</i>	<i>BODY</i>

8.1.1 ADIOS package

Contents:

ADIOS is a high-performance I/O library. This package implements the *dump atom/adios*, *dump custom/adios* and *read_dump ... format adios* commands to write and read data using the ADIOS library.

Authors: Norbert Podhorszki (ORNL) from the ADIOS developer team.

Added in version 28Feb2019.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/ADIOS: filenames -> commands`
- `src/ADIOS/README`
- `examples/PACKAGES/adios`
- <https://github.com/ornladios/ADIOS2>
- *dump atom/adios*
- *dump custom/adios*

- *read_dump*
-

8.1.2 AMOEBA package

Contents:

Implementation of the AMOEBA and HIPPO polarized force fields originally developed by Jay Ponder's group at the U Washington at St Louis. The LAMMPS implementation is based on Fortran 90 code provided by the Ponder group in their [Tinker MD software](#).

Authors: Josh Rackers and Steve Plimpton (Sandia), Trung Nguyen (U Chicago)

Supporting info:

- `src/AMOEBA`: filenames -> commands
 - *AMOEBA and HIPPO howto*
 - *pair_style amoeba*
 - *pair_style hippo*
 - *atom_style amoeba*
 - *angle_style amoeba*
 - *improper_style amoeba*
 - *fix amoeba/bitorsion*
 - *fix amoeba/pitorsion*
 - `tools/tinker/tinker2lmp.py`
 - `examples/amoeba`
-

8.1.3 APIP package

Contents:

This package provides adaptive-precision interatomic potentials (APIP) as described in:

D. Immel, R. Drautz and G. Sutmann, "Adaptive-precision potentials for large-scale atomistic simulations", J. Chem. Phys. 162, 114119 (2025) [link](#)

D. Immel, R. Drautz and G. Sutmann, "Conservative adaptive-precision interatomic potentials", arXiv:2512.07693 [link](#)

Adaptive-precision means, that a fast interatomic potential, such as EAM, is coupled to a precise interatomic potential, such as ACE. This package provides the required `pair_styles` and fixes to run an efficient, energy-conserving adaptive-precision simulation.

In the context of this package, precision refers to the accuracy of an interatomic potential.

Authors:

This package was written by David Immel¹, Ralf Drautz² and Godehard Sutmann^{1,2}.

¹: Forschungszentrum Juelich, Juelich, Germany

²: Ruhr-University Bochum, Bochum, Germany

Install:

The APIP package requires also the installation of ML-PACE, which has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/APIP`: filenames -> commands
 - *Howto APIP*
 - `examples/PACKAGES/apip`
 - *fix atom_weight/apip*
 - *fix lambda/apip*
 - *fix lambda/la/csp/apip*
 - *fix lambda_thermostat/apip*
 - *pair_style eam/apip*
 - *pair_style lambda/zone/apip*
 - *pair_style lambda/input/apip*
 - *pair_style pace/apip*
-

8.1.4 ASPHERE package

Contents:

Computes, time-integration fixes, and pair styles for aspherical particle models including ellipsoids, granular superellipsoids, 2d lines, and 3d triangles.

Supporting info:

- `src/ASPHERE`: filenames -> commands
 - *Howto spherical*
 - *pair_style gayberne*
 - *pair_style resquared*
 - *pair_style ylz*
 - *pair_style line/lj*
 - *pair_style tri/lj*
 - *pair_style granular/superellipsoid*
 - `doc/PDF/pair_gayberne_extra.pdf`
 - `doc/PDF/pair_resquared_extra.pdf`
 - `examples/ASPHERE`
 - `examples/ellipse`
 - <https://www.lammps.org/movies.html#line>
 - <https://www.lammps.org/movies.html#tri>
-

8.1.5 BOCS package

Contents:

This package provides *fix bocs*, a modified version of *fix npt* which includes the pressure correction to the barostat as outlined in:

N. J. H. Dunn and W. G. Noid, “Bottom-up coarse-grained models that accurately describe the structure, pressure, and compressibility of molecular liquids”, J. Chem. Phys. 143, 243148 (2015).

The package also includes a *pair_style* that flexibly defines interactions as a function of the local density and/or gradient of the local density around a central particle. Its per-atom local-density data can be written out with *fix pair* in a form that is compatible with the Bottom-up Open-source Coarse-graining Software (BOCS), an external coarse-graining package that can be used to parameterize such potentials from atomistic simulation data (see link below).

The package is compatible with molecular topologies, allows the user to specify the length-scale and weighting functions for multiple types of local densities, and distinguishes asymmetric local density potentials. (e.g. distinct potentials can govern 1.) solute density around solvent molecules and 2.) solvent density around solute molecules)

The local density potentials implemented define “local density” flexibly with different choices of indicator weighting functions and asymmetry in interactions as generically described in: Michael R. DeLyser and W. G. Noid (2019). “Analysis of local density potentials” The Journal of Chemical Physics 151, : 224106 DOI: 10.1063/1.5128665

The square gradient potential implementation is described in: Michael R. DeLyser and W. G. Noid (2021) “Coarse-grained models for local density gradients” The Journal of Chemical Physics, 156, 034106 DOI: 10.1063/5.0075291

Authors: - Nicholas J. H. Dunn and Michael R. DeLyser (The Pennsylvania State University) for *fix bocs* - Michael R. DeLyser, Maria Lesniewski and Will Noid (The Pennsylvania State University) for *pair_style ldd*

Supporting info:

- `src/BOCS: filenames -> commands`
- `src/BOCS/README`
- `examples/PACKAGES/bocs`
- *fix bocs*
- *Howto_ldd*
- *pair_style ldd*

The BOCS package in LAMMPS is part of the BOCS software package: <https://github.com/noid-group/BOCS>

See the following reference for information about the entire package:

Dunn, NJH; Lebold, KM; DeLyser, MR; Rudzinski, JF; Noid, WG. “BOCS: Bottom-Up Open-Source Coarse-Graining Software.” J. Phys. Chem. B. 122, 13, 3363-3377 (2018).

Example inputs are in the `examples/PACKAGES/bocs` folder.

8.1.6 BODY package

Contents:

Body-style particles with internal structure. Computes, time-integration fixes, pair styles, as well as the body styles themselves. See the *Howto body* page for an overview.

Supporting info:

- `src/BODY filenames -> commands`
- *Howto_body*

- *atom_style body*
 - *fix nve/body*
 - *pair_style body/nparticle*
 - *examples/body*
-

8.1.7 BPM package

Contents:

Pair styles, bond styles, fixes, and computes for bonded particle models for mesoscale simulations of solids and fracture. See the *Howto bpm* page for an overview.

Authors: Joel T. Clemmer (Sandia National Labs)

Added in version 4May2022.

Supporting info:

- *src/BPM*: filenames -> commands
 - *Howto bpm*
 - *atom_style bpm/sphere*
 - *bond_style bpm/rotational*
 - *bond_style bpm/spring*
 - *compute nbond/atom*
 - *fix nve/bpm/sphere*
 - *pair_style bpm/spring*
 - <https://www.lammps.org/movies.html#bpmpackage>
 - *examples/bpm*
-

8.1.8 BROWNIAN package

Contents:

This package provides *fix brownian*, *fix brownian/sphere*, and *fix brownian/asphere* as well as *fix propel/self* which allow performing Brownian Dynamics time integration of point, spherical and aspherical particles and also support self-propelled particles.

Authors: Sam Cameron (University of Bristol), Arthur Straube (Zuse Institute Berlin), Stefan Paquay (while at Brandeis University) (initial version of *fix propel/self*)

Added in version 14May2021.

Example inputs are in the *examples/PACKAGES/brownian* folder.

8.1.9 CG-DNA package

Contents:

Several pair styles, bond styles, and integration fixes for coarse-grained modelling of single- and double-stranded DNA and RNA based on the oxDNA and oxRNA model of Doye, Louis and Ouldridge. The package includes Langevin-type rigid-body integrators with improved stability.

Author: Oliver Henrich (University of Strathclyde, Glasgow).

Install:

The CG-DNA package requires that also the *MOLECULE* and *ASPHERE* packages are installed.

Supporting info:

- `src/CG-DNA: filenames -> commands`
 - `src/CG-DNA/README`
 - `pair_style oxdna/*`
 - `pair_style oxdna2/*`
 - `pair_style oxdna3/*`
 - `pair_style oxrna2/*`
 - `bond_style oxdna/*`
 - `bond_style oxdna2/*`
 - `bond_style oxdna3/*`
 - `bond_style oxrna2/*`
 - `fix nve/dotc/langevin`
 - `examples/PACKAGES/cgdna`
-

8.1.10 CG-SPICA package

Contents:

Several pair styles and an angle style which implement the coarse-grained SPICA (formerly called SDK) model which enables simulation of biological or soft material systems.

Original Author: Axel Kohlmeyer (Temple U).

Maintainers: Yusuke Miyazaki and Wataru Shinoda (Okayama U).

Supporting info:

- `src/CG-SPICA: filenames -> commands`
 - `src/CG-SPICA/README`
 - `pair_style lj/spica/*`
 - `angle_style spica`
 - `examples/PACKAGES/cgspica`
 - <https://www.lammps.org/pictures.html#cg>
 - <https://www.spica-ff.org/>
-

8.1.11 CLASS2 package

Contents:

Bond, angle, dihedral, improper, and pair styles for the COMPASS CLASS2 molecular force field.

Supporting info:

- `src/CLASS2: filenames -> commands`
 - *`bond_style class2`*
 - *`angle_style class2`*
 - *`dihedral_style class2`*
 - *`improper_style class2`*
 - *`pair_style lj/class2`*
-

8.1.12 COLLOID package

Contents:

Coarse-grained finite-size colloidal particles. Pair styles and fix wall styles for colloidal interactions. Includes the Fast Lubrication Dynamics (FLD) method for hydrodynamic interactions, which is a simplified approximation to Stokesian dynamics.

Authors: This package includes Fast Lubrication Dynamics pair styles which were created by Amit Kumar and Michael Bybee from Jonathan Higdon's group at UIUC.

Supporting info:

- `src/COLLOID: filenames -> commands`
 - *`fix wall/colloid`*
 - *`pair_style colloid`*
 - *`pair_style yukawa/colloid`*
 - *`pair_style brownian`*
 - *`pair_style lubricate`*
 - *`pair_style lubricateU`*
 - `examples/colloid`
 - `examples/srd`
-

8.1.13 COLVARS package

Contents:

Colvars stands for collective variables, which can be used to implement various enhanced sampling methods, including Adaptive Biasing Force, Metadynamics, Steered MD, Umbrella Sampling and Restraints. A *`fix colvars`* command is implemented which wraps a COLVARS library, which implements these methods. simulations.

Authors: The COLVARS library is written and maintained by Giacomo Fiorin (NIH, Bethesda, MD, USA) and Jerome Henin (CNRS, Paris, France), originally for the NAMD MD code, but with portability in mind. Axel Kohlmeyer (Temple U) provided the interface to LAMMPS.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/COLVARS`: filenames -> commands
 - <https://colvars.github.io/master/colvars-refman-lammps.html>
 - `doc/PDF/colvars-refman-lammps.pdf`
 - `src/COLVARS/README`
 - `lib/colvars/README`
 - *fix colvars*
 - *group2ndx*
 - *ndx2group*
 - `examples/PACKAGES/colvars`
-

8.1.14 COMPRESS package

Contents:

Compressed output of dump files via the zlib compression library, using dump styles with a “gz” in their style name.

To use this package you must have the zlib compression library available on your system.

Author: Axel Kohlmeyer (Temple U).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/COMPRESS`: filenames -> commands
 - `src/COMPRESS/README`
 - `lib/compress/README`
 - *dump atom/gz*
 - *dump cfg/gz*
 - *dump custom/gz*
 - *dump xyz/gz*
-

8.1.15 CORESHELL package

Contents:

Compute and pair styles that implement the adiabatic core/shell model for polarizability. The pair styles augment Born, Buckingham, and Lennard-Jones styles with core/shell capabilities. The *compute temp/cs* command calculates the temperature of a system with core/shell particles. See the *Howto coreshell* page for an overview of how to use this package.

Author: Hendrik Heenen (Technical U of Munich).

Supporting info:

- `src/CORESHELL`: filenames -> commands
 - *Howto coreshell*
 - *Howto polarizable*
 - *compute temp/cs*
 - *pair_style born/coul/long/cs*
 - *pair_style buck/coul/long/cs*
 - *pair_style lj/cut/coul/long/cs*
 - `examples/coreshell`
-

8.1.16 DIELECTRIC package

Contents:

An atom style, multiple pair styles, several fixes, Kspace styles and a compute for simulating systems using boundary element solvers for computing the induced charges at the interface between two media with different dielectric constants.

Install:

To use this package, also the *KSPACE* and *EXTRA-PAIR* packages need to be installed.

Author: Trung Nguyen and Monica Olvera de la Cruz (Northwestern U)

Added in version 2Jul2021.

Supporting info:

- `src/DIELECTRIC`: filenames -> commands
 - *atom_style dielectric*
 - *pair_style coul/cut/dielectric*
 - *pair_style coul/long/dielectric*
 - *pair_style lj/cut/coul/cut/dielectric*
 - *pair_style lj/cut/coul/debye/dielectric*
 - *pair_style lj/cut/coul/long/dielectric*
 - *pair_style lj/cut/coul/msm/dielectric*
 - *pair_style ppm/dielectric*
 - *pair_style ppm/disp/dielectric*
 - *pair_style msm/dielectric*
 - *fix_style polarize/bem/icc*
 - *fix_style polarize/bem/gmres*
 - *fix_style polarize/functional*
 - *compute efield/atom*
 - `examples/PACKAGES/dielectric`
-

8.1.17 DIFFRACTION package

Contents:

Two computes and a fix for calculating x-ray and electron diffraction intensities based on kinematic diffraction theory.

Author: Shawn Coleman while at the U Arkansas.

Supporting info:

- `src/DIFFRACTION`: filenames -> commands
 - `compute saed`
 - `compute xrd`
 - `fix saed/vtk`
 - `examples/PACKAGES/diffraction`
-

8.1.18 DIPOLE package

Contents:

An atom style and several pair styles for point dipole models with short-range or long-range interactions.

Supporting info:

- `src/DIPOLE`: filenames -> commands
 - `atom_style dipole`
 - `pair_style lj/cut/dipole/cut`
 - `pair_style lj/cut/dipole/long`
 - `pair_style lj/long/dipole/long`
 - `angle_style dipole`
 - `examples/dipole`
-

8.1.19 DPD-BASIC package

Contents:

Pair styles for the basic dissipative particle dynamics (DPD) method and DPD thermostatting.

Pair style `dpd/coul/slater/long` also includes smeared charges for coulomb interactions and thus requires the *KSPACE* package to be installed to handle the long-range Coulomb part of the interactions.

Authors: Kurt Smith (U Pittsburgh), Martin Svoboda, Martin Lisl (ICPF and UJEP), Eddy Barraud (IFPEN)

Supporting info:

- `src/DPD-BASIC`: filenames -> commands
- `pair_style dpd`
- `pair_style dpd/tstat`
- `pair_style dpd/ext`
- `pair_style dpd/ext/tstat`

- *pair_style dpd/coul/slatter/long*
 - `examples/PACKAGES/dpd-basic`
-

8.1.20 DPD-MESO package

Contents:

Several extensions of the dissipative particle dynamics (DPD) method. Specifically, energy-conserving DPD (eDPD) that can model non-isothermal processes, many-body DPD (mDPD) for simulating vapor-liquid coexistence, and transport DPD (tDPD) for modeling advection-diffusion-reaction systems. The equations of motion of these DPD extensions are integrated through a modified velocity-Verlet (MVV) algorithm.

Author: Zhen Li (Department of Mechanical Engineering, Clemson University)

Supporting info:

- `src/DPD-MESO: filenames -> commands`
 - `src/DPD-MESO/README`
 - *atom_style edpd*
 - *pair_style edpd*
 - *pair_style mdpd*
 - *pair_style tdpd*
 - *fix mvv/dpd*
 - `examples/PACKAGES/mesodpd`
-

8.1.21 DPD-REACT package

Contents:

DPD stands for dissipative particle dynamics. This package implements coarse-grained DPD-based models for energetic, reactive molecular crystalline materials. It includes many pair styles specific to these systems, including for reactive DPD, where each particle has internal state for multiple species and a coupled set of chemical reaction ODEs are integrated each timestep. Highly accurate time integrators for isothermal, isoenergetic, isobaric and isenthalpic conditions are included. These enable long timesteps via the Shardlow splitting algorithm.

Authors: Jim Larentzos (ARL), Tim Mattox (Engility Corp), and John Brennan (ARL).

Supporting info:

- `src/DPD-REACT: filenames -> commands`
- `src/DPD-REACT/README`
- *compute dpd*
- *compute dpd/atom*
- *fix eos/cv*
- *fix eos/table*
- *fix eos/table/rx*
- *fix shardlow*

- *fix rx*
 - *pair_style table/rx*
 - *pair_style dpd/fdt*
 - *pair_style dpd/fdt/energy*
 - *pair_style exp6/rx*
 - *pair_style multi/lucy*
 - *pair_style multi/lucy/rx*
 - `examples/PACKAGES/dpd-react`
-

8.1.22 DPD-SMOOTH package

Contents:

A pair style for smoothed dissipative particle dynamics (SDPD), which is an extension of smoothed particle hydrodynamics (SPH) to mesoscale where thermal fluctuations are important (see the *SPH package*). Also two fixes for moving and rigid body integration of SPH/SDPD particles (particles of atom_style meso).

Author: Morteza Jalalvand (Institute for Advanced Studies in Basic Sciences, Iran).

Supporting info:

- `src/DPD-SMOOTH: filenames -> commands`
 - `src/DPD-SMOOTH/README`
 - *pair_style sdpd/taitwater/isothermal*
 - *fix meso/move*
 - *fix rigid/meso*
 - `examples/PACKAGES/dpd-smooth`
-

8.1.23 DRUDE package

Contents:

Fixes, pair styles, and a compute to simulate thermalized Drude oscillators as a model of polarization. See the *Howto drude* and *Howto drude2* pages for an overview of how to use the package. There are auxiliary tools for using this package in `tools/drude`.

Authors: Alain Dequidt (U Clermont Auvergne), Julien Devemy (CNRS), and Agilio Padua (ENS de Lyon).

Supporting info:

- `src/DRUDE: filenames -> commands`
- *Howto drude*
- *Howto drude2*
- *Howto polarizable*
- `src/DRUDE/README`
- *fix drude*

- *fix drude/transform/**
 - *compute temp/drude*
 - *pair_style thole*
 - *pair_style lj/cut/thole/long*
 - `examples/PACKAGES/drude`
 - `tools/drude`
-

8.1.24 EFF package

Contents:

EFF stands for electron force field which allows a classical MD code to model electrons as particles of variable radius. This package contains atom, pair, fix and compute styles which implement the eFF as described in A. Jaramillo-Botero, J. Su, Q. An, and W.A. Goddard III, JCC, 2010. The eFF potential was first introduced by Su and Goddard, in 2007. There are auxiliary tools for using this package in tools/eff; see its README file.

Author: Andres Jaramillo-Botero (CalTech).

Supporting info:

- `src/EFF: filenames -> commands`
 - `src/EFF/README`
 - *atom_style electron*
 - *fix nve/eff*
 - *fix nvt/eff*
 - *fix npt/eff*
 - *fix langevin/eff*
 - *compute temp/eff*
 - *pair_style eff/cut*
 - *pair_style eff/inline*
 - `examples/PACKAGES/eff`
 - `tools/eff/README`
 - `tools/eff`
 - <https://www.lammps.org/movies.html#eff>
-

8.1.25 ELECTRODE package

Contents:

The ELECTRODE package allows the user to enforce a constant potential method for groups of atoms that interact with the remaining atoms as electrolyte.

Authors: The ELECTRODE package is written and maintained by Ludwig Ahrens-Iwers (TUHH, Hamburg, Germany), Shern Tee (UQ, Brisbane, Australia) and Robert Meissner (Helmholtz-Zentrum Hereon, Geesthacht and TUHH, Hamburg, Germany).

Added in version 4May2022.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- *fix electrode/comp*
 - *fix electrode/conq*
 - *fix electrode/thermo*
-

8.1.26 EXTRA-COMMAND package

Contents:

Additional command styles that are less commonly used.

Supporting info:

- `src/EXTRA-COMMAND`: filenames -> commands
 - *general commands*
-

8.1.27 EXTRA-COMPUTE package

Contents:

Additional compute styles that are less commonly used.

Supporting info:

- `src/EXTRA-COMPUTE`: filenames -> commands
 - *compute*
-

8.1.28 EXTRA-DUMP package

Contents:

Additional dump styles that are less commonly used.

Supporting info:

- `src/EXTRA-DUMP`: filenames -> commands
 - *dump*
-

8.1.29 EXTRA-FIX package

Contents:

Additional fix styles that are less commonly used.

Supporting info:

- `src/EXTRA-FIX`: filenames -> commands
 - *fix*
-

8.1.30 EXTRA-MOLECULE package

Contents:

Additional bond, angle, dihedral, and improper styles that are less commonly used.

Install:

To use this package, also the *MOLECULE* package needs to be installed.

Supporting info:

- `src/EXTRA-MOLECULE`: filenames -> commands
 - *molecular styles*
-

8.1.31 EXTRA-PAIR package

Contents:

Additional pair styles that are less commonly used.

Supporting info:

- `src/EXTRA-PAIR`: filenames -> commands
 - *pair_style*
 - `examples/PACKAGES/dispersion`
-

8.1.32 FEP package

Contents:

FEP stands for free energy perturbation. This package provides methods for performing FEP simulations by using a *fix adapt/fep* command with soft-core pair potentials, which have a “soft” in their style name. There are auxiliary tools for using this package in `tools/fep`; see its README file.

Author: Agilio Padua (ENS de Lyon)

Supporting info:

- `src/FEP`: filenames -> commands
 - `src/FEP/README`
 - *fix adapt/fep*
 - *compute fep*
-

- *pair_style */soft*
 - *pair_style coul/cut/soft/gapsys*
 - *pair_style lj/cut/soft/gapsys*
 - *examples/PACKAGES/fep*
 - *tools/fep/README*
 - *tools/fep*
-

8.1.33 GPU package

Contents:

Dozens of pair styles and a version of the PPPM long-range Coulombic solver optimized for GPUs. All such styles have a “gpu” as a suffix in their style name. The GPU code can be compiled with either CUDA or OpenCL, however the OpenCL variants are no longer actively maintained and only the CUDA versions are regularly tested. The [GPU package](#) page gives details of what hardware and GPU software is required on your system, and details on how to build and use this package. Its styles can be invoked at run time via the `-sf gpu` or `-suffix gpu` *command-line switches*. See also the [KOKKOS](#) package, which has GPU-enabled styles.

Authors: Mike Brown (Intel) while at Sandia and ORNL and Trung Nguyen (Northwestern U) while at ORNL and later. AMD HIP support by Evgeny Kuznetsov, Vladimir Stegailov, and Vsevolod Nikolskiy (HSE University).

Install:

This package has *specific installation instructions* on the [Build extras](#) page.

Supporting info:

- *src/GPU: filenames -> commands*
 - *src/GPU/README*
 - *lib/gpu/README*
 - *Accelerator packages*
 - *GPU package*
 - *Section 4.2 -sf gpu*
 - *Section 4.2 -pk gpu*
 - *package gpu*
 - *Commands* pages (*pair*, *kpace*) for styles followed by (g)
 - [Benchmarks](#) page of website
-

8.1.34 GRAPHICS package

Contents:

Dump styles *image and movie*, supporting classes for rendering images and fonts, several fixes for adding graphics objects to visualizations, and the `region2vmd` command for exporting visualizations of regions as scripted graphics in VMD.

Supporting info:

- `src/GRAPHICS`: filenames -> commands
 - *Visualize LAMMPS snapshots*
 - *dump image*
 - *dump movie*
 - *fix graphics/arrows*
 - *fix graphics/isosurface*
 - *fix graphics/labels,*
 - *fix graphics/lines,*
 - *fix graphics/objects,*
 - *fix graphics/periodic,*
 - *region2vmd*
 - <https://www.youtube.com/watch?v=9HEsGaOsdik>
 - <https://www.youtube.com/watch?v=f4hfPs7aCmI>
 - <https://www.youtube.com/shorts/1QEjITapwQ>
 - https://www.youtube.com/shorts/OYn_VVodnIg
 - <https://www.youtube.com/shorts/4Cm5p0SfgNU>
-

8.1.35 GRANULAR package

Contents:

Pair styles and fixes for finite-size granular particles, which interact with each other and boundaries via frictional and dissipative potentials.

Supporting info:

- `src/GRANULAR`: filenames -> commands
- *Howto granular*
- *fix pour*
- *fix wall/gran*
- *pair_style gran/hooke*
- *pair_style gran/hertz/history*
- `examples/granregion`
- `examples/pour`
- `bench/in.chute`
- <https://www.lammps.org/pictures.html#jamming>
- <https://www.lammps.org/movies.html#hopper>
- <https://www.lammps.org/movies.html#dem>
- <https://www.lammps.org/movies.html#brazil>
- <https://www.lammps.org/movies.html#granregion>

8.1.36 GRANSURF package

Contents:

Granular surfaces consisting of triangles (3d) or line segments (2d). These interact with finite-size granular particles as static or moving boundary conditions and support the same kind of interaction models as granular pair styles do for particle/particle interactions. The collection of triangles or lines can be “global” with each processor storing all of them. Or it can be “local” where the triangles/lines are distributed across processors.

Supporting info:

- `src/GRANSURF`: filenames -> commands
 - *Howto granular surfaces*
 - *fix surface/global*
 - *fix surface/local*
 - *pair_style surf/granular*
 - `examples/gransurf`
-

8.1.37 H5MD package

Contents:

H5MD stands for HDF5 for MD. [HDF5](#) is a portable, binary, self-describing file format, used by many scientific simulations. H5MD is a format for molecular simulations, built on top of HDF5. This package implements a *dump h5md* command to output LAMMPS snapshots in this format.

To use this package you must have the HDF5 library available on your system.

Author: Pierre de Buyl (KU Leuven) created both the package and the H5MD format.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/H5MD`: filenames -> commands
 - `src/H5MD/README`
 - `lib/h5md/README`
 - *dump h5md*
-

8.1.38 INTEL package

Contents:

Dozens of pair, fix, bond, angle, dihedral, improper, and kspace styles which are optimized for Intel CPUs. All of them have an “intel” in their style name. The *INTEL package* page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the `-sf intel` or `-suffix intel` *command-line switches*. Also see the *KOKKOS*, *OPT*, and *OPENMP* packages, which have styles optimized for CPUs and KNLs.

You need to have an Intel compiler, version 14 or higher to take full advantage of this package. While compilation with GNU compilers is supported, performance will be sub-optimal.

Note

the INTEL package contains styles that require using the `-restrict` flag, when compiling with Intel compilers.

Author: Mike Brown (Intel).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/INTEL`: filenames -> commands
- `src/INTEL/README`
- *Accelerator packages*
- *INTEL package*
- *Section 4.2 -sf intel*
- *Section 4.2 -pk intel*
- *package intel*
- Search the *commands* pages (*fix*, *compute*, *pair*, *bond*, *angle*, *dihedral*, *improper*, *kspace*) for styles followed by (i)
- `src/INTEL/TEST`
- *Benchmarks* page of website

8.1.39 INTERLAYER package

Contents:

A collection of pair styles specifically to be used for modeling layered materials, most commonly graphene sheets (or equivalents).

Supporting info:

- `src/INTERLAYER`: filenames -> commands
- *Pair style* page
- `examples/PACKAGES/interlayer`

8.1.40 KIM package

Contents:

This package contains a command with a set of sub-commands that serve as a wrapper on the [Open Knowledgebase of Interatomic Models \(OpenKIM\)](#) repository of interatomic models (IMs) enabling compatible ones to be used in LAMMPS simulations.

This includes *kim init*, and *kim interactions* commands to select, initialize and instantiate the IM, a *kim query* command to perform web queries for material property predictions of OpenKIM IMs, a *kim param* command to access KIM Model Parameters from LAMMPS, and a *kim property* command to write material properties computed in LAMMPS to standard KIM property instance format.

Support for KIM IMs that conform to the [KIM Application Programming Interface \(API\)](#) is provided by the *pair_style kim* command.

Note

The command *pair_style kim* is called by *kim interactions* and is not recommended to be directly used in input scripts.

To use this package you must have the KIM API library available on your system. The KIM API is available for download on the [OpenKIM website](#). When installing LAMMPS from binary, the kim-api package is a dependency that is automatically downloaded and installed.

Information about the KIM project can be found at its website: <https://openkim.org>. The KIM project is led by Ellad Tadmor and Ryan Elliott (U Minnesota) and is funded by the [National Science Foundation](#).

Authors: Ryan Elliott (U Minnesota) is the main developer for the KIM API and the *pair_style kim* command. Yaser Afshar (U Minnesota), Axel Kohlmeyer (Temple U), Ellad Tadmor (U Minnesota), and Daniel Karls (U Minnesota) contributed to the *kim command* interface in close collaboration with Ryan Elliott.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- *kim command*
- *pair_style kim*
- src/KIM: filenames -> commands
- src/KIM/README
- lib/kim/README
- examples/kim

8.1.41 KOKKOS package

Contents:

Dozens of atom, pair, bond, angle, dihedral, improper, fix, compute styles adapted to compile using the Kokkos library which can convert them to OpenMP or CUDA code so that they run efficiently on multicore CPUs, KNLs, or GPUs. All the styles have a “kk” as a suffix in their style name. The *KOKKOS package* page gives details of what hardware and software is required on your system, and how to build and use this package. Its styles can be invoked at run time via the *-sf kk* or *-suffix kk* *command-line switches*. Also see the *GPU*, *OPT*, *INTEL*, and *OPENMP* packages, which have styles optimized for CPUs, KNLs, and GPUs.

You must have a C++20 compatible compiler to use this package. KOKKOS makes extensive use of advanced C++ features, which can expose compiler bugs, especially when compiling for maximum performance at high optimization levels. Please see the file `lib/kokkos/README` for a list of compilers and their respective platforms, that are known to work.

Authors: The KOKKOS package was created primarily by Christian Trott and Stan Moore (Sandia), with contributions from other folks as well. It uses the open-source [Kokkos library](#) which was developed by Carter Edwards, Christian Trott, and others at Sandia, and which is included in the LAMMPS distribution in `lib/kokkos`.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/KOKKOS`: filenames -> commands
 - `src/KOKKOS/README`
 - `lib/kokkos/README`
 - *Accelerator packages*
 - *KOKKOS package*
 - *Section 4.2 -k on ...*
 - *Section 4.2 -sf kk*
 - *Section 4.2 -pk kokkos*
 - *package kokkos*
 - Search the *commands* pages (*fix*, *compute*, *pair*, *bond*, *angle*, *dihedral*, *improper*, *kpace*) for styles followed by (k)
 - *Benchmarks* page of website
-

8.1.42 KSPACE package

Contents:

A variety of long-range Coulombic solvers, as well as pair styles which compute the corresponding short-range pair-wise Coulombic interactions. These include Ewald, particle-particle particle-mesh (PPPM), and multilevel summation method (MSM) solvers.

Install:

Building with this package requires a 1d FFT library be present on your system for use by the PPPM solvers. This can be the KISS FFT library provided with LAMMPS, third party libraries like FFTW, or a vendor-supplied FFT library. See the *Build settings* page for details on how to select different FFT options for your LAMMPS build.

Supporting info:

- `src/KSPACE`: filenames -> commands
- *kpace_style*
- `doc/PDF/kpace.pdf`
- *Howto tip3p*
- *Howto tip4p*
- *Howto spc*
- *pair_style coul*
- Search the *pair style* page for styles with “long” or “msm” in name
- `examples/peptide`

- `bench/in.rhodo`
-

8.1.43 LATBOLTZ package

Contents:

Fixes which implement a background Lattice-Boltzmann (LB) fluid, which can be used to model MD particles influenced by hydrodynamic forces.

Authors: Frances Mackay and Colin Denniston (University of Western Ontario).

Install:

The LATBOLTZ package requires that LAMMPS is built in *MPI parallel mode*.

Supporting info:

- `src/LATBOLTZ`: filenames -> commands
 - `src/LATBOLTZ/README`
 - *fix lb/fluid*
 - *fix lb/momentum*
 - *fix lb/viscous*
 - `examples/PACKAGES/latboltz`
-

8.1.44 LEPTON package

Contents:

Styles for pair, bond, and angle forces that evaluate the potential function from a string using the *Lepton mathematical expression parser*. Lepton is a C++ library that is bundled with *OpenMM* and can be used for parsing, evaluating, differentiating, and analyzing mathematical expressions. This is a more lightweight and efficient alternative for evaluating custom potential function to an embedded Python interpreter as used in the *PYTHON package*. On the other hand, since the potentials are evaluated from analytical expressions, they are more precise than what can be done with *tabulated potentials*.

Authors: Axel Kohlmeyer (Temple U). Lepton itself is developed by Peter Eastman at Stanford University.

Added in version 8Feb2023.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/LEPTON`: filenames -> commands
 - `lib/lepton/README.md`
 - *pair_style lepton*
 - *bond_style lepton*
 - *angle_style lepton*
 - *dihedral_style lepton*
-

8.1.45 MACHDYN package

Contents:

An atom style, fixes, computes, and several pair styles which implements smoothed Mach dynamics (SMD) for solids, which is a model related to smoothed particle hydrodynamics (SPH) for liquids (see the [SPH package](#)).

This package solves solids mechanics problems via a state of the art stabilized meshless method with hourglass control. It can specify hydrostatic interactions independently from material strength models, i.e. pressure and deviatoric stresses are separated. It provides many material models (Johnson-Cook, plasticity with hardening, Mie-Grueneisen, Polynomial EOS) and allows new material models to be added. It implements rigid boundary conditions (walls) which can be specified as surface geometries from *.STL files.

Author: Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

Install:

This package has *specific installation instructions* on the [Build extras](#) page.

Supporting info:

- `src/MACHDYN`: filenames -> commands
 - `src/MACHDYN/README`
 - [doc/PDF/MACHDYN_LAMMPS_userguide.pdf](#)
 - `examples/PACKAGES/machdyn`
-

8.1.46 MANIFOLD package

Contents:

Several fixes and a “manifold” class which enable simulations of particles constrained to a manifold (a 2D surface within the 3D simulation box). This is done by applying the RATTLE constraint algorithm to formulate single-particle constraint functions $g(x_i, y_i, z_i) = 0$ and their derivative (i.e. the normal of the manifold) $n = \text{grad}(g)$.

Author: Stefan Paquay (until 2017: Eindhoven University of Technology (TU/e), The Netherlands; since 2017: Brandeis University, Waltham, MA, USA)

Supporting info:

- `src/MANIFOLD`: filenames -> commands
 - `src/MANIFOLD/README`
 - [Howto manifold](#)
 - [fix manifoldforce](#)
 - [fix nve/manifold/rattle](#)
 - [fix nvt/manifold/rattle](#)
 - `examples/PACKAGES/manifold`
 - <https://www.lammps.org/movies.html#manifold>
-

8.1.47 MANYBODY package

Contents:

A variety of many-body and bond-order potentials. These include (AI)REBO, BOP, EAM, EIM, Stillinger-Weber, and Tersoff potentials.

Supporting info:

- `src/MANYBODY`: filenames -> commands
 - [Pair style](#) page

 - `examples/nb3d`
 - `examples/shear`
 - `examples/streitz`
 - `examples/vashishta`
 - `bench/in.eam`
-

8.1.48 MBX Package

Contents

The `pair_style mbx` command implements the MBX library for MB-pol and MB-nrg data-driven many-body potential energy functions. MBX is called using [pair_style mbx](#) command, which allows for MB-nrg potentials such as MB-pol to be used in LAMMPS. For more information on MBX, see the [MBX library](#) website.

Authors: The [MBX library](#) is developed by the Paesani group at the University of California, San Diego. Major contributors include: Marc Riera, Christopher Knight, Ethan Bull-Vulpe, and Henry Agnew.

Added in version 11Feb2026.

Install:

This package has [specific installation instructions](#) on the [Build extras](#) page.

Supporting info:

- `src/MBX`: filenames -> commands
 - [pair_style mbx](#)
 - <https://mbxsimulations.com/>
-

8.1.49 MC package

Contents:

Several fixes and a pair style that have Monte Carlo (MC) or MC-like attributes. These include fixes for creating, breaking, and swapping bonds, for performing atomic swaps, and performing grand canonical MC (GCMC), semi-grand canonical MC (SGCMC), Gibbs ensemble MC (GEMC) or similar processes in conjunction with molecular dynamics (MD).

Supporting info:

- `src/MC: filenames -> commands`
 - *fix atom/swap*
 - *fix bond/break*
 - *fix bond/create*
 - *fix bond/create/angle*
 - *fix bond/swap*
 - *fix charge/regulation*
 - *fix gcmc*
 - *fix gemc*
 - *fix hmc*
 - *fix mol/swap*
 - *fix neighbor/swap*
 - *fix sgcmc*
 - *fix tfmc*
 - *fix widom*
 - *pair_style dsmc*
 - <https://www.lammps.org/movies.html#gcmc>
-

8.1.50 MDI package

Contents:

A LAMMPS command and fixes to allow client-server coupling of LAMMPS to other atomic or molecular simulation codes or materials modeling workflows via the [MolSSI Driver Interface \(MDI\) library](#).

Author: Taylor Barnes - MolSSI, [taylor.a.barnes at gmail.com](mailto:taylor.a.barnes@gmail.com)

Added in version 14May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/MDI/README`
 - `lib/mdi/README`
 - *Howto MDI*
 - *mdi*
 - *fix mdi/qm*
 - `examples/PACKAGES/mdi`
-

8.1.51 MEAM package

Contents:

A pair style for the modified embedded atom (MEAM) potential translated from the Fortran version in the (obsolete) MEAM package to plain C++. The MEAM fully replaces the MEAM package, which has been removed from LAMMPS after the 12 December 2018 version.

Author: Sebastian Huetter, (Otto-von-Guericke University Magdeburg) based on the Fortran version of Greg Wagner (Northwestern U) while at Sandia.

Supporting info:

- `src/MEAM`: filenames -> commands
 - `src/MEAM/README`
 - *[pair_style meam](#)*
 - `examples/meam`
-

8.1.52 MESONT package

Contents:

MESONT is a LAMMPS package for simulation of nanomechanics of nanotubes (NTs). The model is based on a coarse-grained representation of NTs as “flexible cylinders” consisting of a variable number of segments. Internal interactions within a NT and the van der Waals interaction between the tubes are described by a mesoscopic force field designed and parameterized based on the results of atomic-level molecular dynamics simulations. The description of the force field is provided in the papers listed in `src/MESONT/README`.

This package used to have two independent implementations of this model: the original implementation using a Fortran library written by the developers of the model and a second implementation written in C++ by Philipp Kloza (U Cambridge). Since the C++ implementation offers the same features as the original implementation with the addition of friction, is typically faster, and easier to compile/install, the Fortran library based implementation has since been obsoleted and removed from the distribution. You have to download and compile an older version of LAMMPS if you want to use those.

Download of potential files:

The potential files for these pair styles are *very* large and thus are not included in the regular downloaded packages of LAMMPS or the git repositories. Instead, they will be automatically downloaded from a web server when the package is installed for the first time.

Authors of the obsoleted `*mesont*` styles:

Maxim V. Shugaev (University of Virginia), Alexey N. Volkov (University of Alabama), Leonid V. Zhigilei (University of Virginia)

Deprecated since version 8Feb2023.

Author of the C++ styles: Philipp Kloza (U Cambridge)

Added in version 15Jun2020.

Supporting info:

- `src/MESONT`: filenames -> commands
- `src/MESONT/README`
- *[bond_style mesocnt](#)*

- *angle_style mesocnt*
 - *pair_style mesocnt*
 - `examples/PACKAGES/mesont`
-

8.1.53 MGPT package

Contents:

A pair style which provides a fast implementation of the quantum-based MGPT multi-ion potentials. The MGPT or model GPT method derives from first-principles DFT-based generalized pseudopotential theory (GPT) through a series of systematic approximations valid for mid-period transition metals with nearly half-filled d bands. The MGPT method was originally developed by John Moriarty at LLNL. The pair style in this package calculates forces and energies using an optimized matrix-MGPT algorithm due to Tomas Oppelstrup at LLNL.

Authors: Tomas Oppelstrup and John Moriarty (LLNL).

Supporting info:

- `src/MGPT`: filenames -> commands
 - `src/MGPT/README`
 - *pair_style mgpt*
 - `examples/PACKAGES/mgpt`
-

8.1.54 MISC package

Contents:

A variety of compute, fix, pair, bond styles with specialized capabilities that don't align with other packages. Do a directory listing, `ls src/MISC`, to see the list of commands.

Note

the MISC package contains styles that require using the `-restrict` flag, when compiling with Intel compilers.

Supporting info:

- `src/MISC`: filenames -> commands
- *bond_style special*
- *compute viscosity/cos*
- *fix accelerate/cos*
- *fix imd*
- *fix ipi*
- *pair_style agni*
- *pair_style list*
- *pair_style srp*
- *pair_style tracker*

8.1.55 ML-HDNNP package

Contents:

A *pair_style hdnp* command which allows the use of high-dimensional neural network potentials (HDNNPs), a form of machine learning potentials. HDNNPs must be carefully trained prior to their application in a molecular dynamics simulation.

To use this package you must have the *n2p2* library installed and compiled on your system.

Author: Andreas Singraber

Added in version 27May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/ML-HDNNP`: filenames -> commands
 - `src/ML-HDNNP/README`
 - `lib/hdnp/README`
 - *pair_style hdnp*
 - `examples/PACKAGES/hdnp`
-

8.1.56 ML-RUNNER package

Contents: A *pair_style runner* command for the efficient evaluation of second-, third-, and fourth-generation high-dimensional neural network potentials (HDNNPs).

To use this package you must have the *RuNNer* library compiled on your system.

Authors: K. Nikolas Lausch, Alexander L. M. Knoll, Moritz R. Schaefer,
Gunnar Schmitz, Joerg Behler (Ruhr-University Bochum)

Install:

This package has *specific installation instructions* on the *Build extras* page.

Added in version 4Jul2026.

Supporting info:

- `src/ML-RUNNER`: filenames -> commands
 - *pair_style runner*
 - `examples/PACKAGES/ml-runner` (see README.txt)
-

8.1.57 ML-IAP package

Contents:

A general interface for machine-learning interatomic potentials, including PyTorch.

Install:

To use this package, also the *ML-SNAP* package needs to be installed. To make the *mliappy* model available, also the *PYTHON* package needs to be installed, the version of Python must be 3.6 or later, and the *cython* software must be installed.

Author: Aidan Thompson (Sandia), Nicholas Lubbers (LANL).

Added in version 30Jun2020.

Supporting info:

- `src/ML-IAP`: filenames -> commands
- `src/ML-IAP/README.md`
- *pair_style mliap*
- *compute_style mliap*
- `examples/mliap` (see README)

When built with the *mliappy* model this package includes an extension for coupling with Python models, including PyTorch. In this case, the Python interpreter linked to LAMMPS will need the *cython* and *numpy* modules installed. The provided examples build models with PyTorch, which would therefore also need to be installed to run those examples.

8.1.58 ML-PACE package

Contents:

A pair style for the Atomic Cluster Expansion potential (ACE). ACE is a methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. The ML-PACE package provides an efficient implementation for running simulations with ACE potentials.

Authors:

This package was written by Yury Lysogorskiy¹, Cas van der Oord², Anton Bochkarev¹, Sarath Menon¹, Matteo Rinaldi¹, Thomas Hammerschmidt¹, Matous Mrovec¹, Aidan Thompson³, Gabor Csanyi², Christoph Ortner⁴, Ralf Drautz¹.

¹: Ruhr-University Bochum, Bochum, Germany

²: University of Cambridge, Cambridge, United Kingdom

³: Sandia National Laboratories, Albuquerque, New Mexico, USA

⁴: University of British Columbia, Vancouver, BC, Canada

Added in version 14May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page. This package may also be compiled as a plugin to avoid licensing conflicts when distributing binaries.

Supporting info:

- `src/ML-PACE`: filenames -> commands

- *pair_style pace*
 - `examples/PACKAGES/pace`
-

8.1.59 ML-POD package

Contents:

A pair style and fitpod style for Proper Orthogonal Descriptors (POD). POD is a methodology for deriving descriptors based on the proper orthogonal decomposition. The ML-POD package provides an efficient implementation for running simulations with POD potentials, along with fitting the potentials natively in LAMMPS.

Authors:

Ngoc Cuong Nguyen (MIT), Andrew Rohskopf (Sandia)

Added in version 22Dec2022.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/ML-POD`: filenames -> commands
 - *pair_style pod*
 - *command_style fitpod*
 - `examples/PACKAGES/pod`
-

8.1.60 ML-QUIP package

Contents:

A *pair_style quip* command which wraps the [QUIP libAtoms library](#), which includes a variety of interatomic potentials, including Gaussian Approximation Potential (GAP) models developed by the Cambridge University group.

To use this package you must have the QUIP libAtoms library available on your system.

Author: Albert Bartok (Cambridge University)

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/ML-QUIP`: filenames -> commands
 - `src/ML-QUIP/README`
 - *pair_style quip*
 - `examples/PACKAGES/quip`
-

8.1.61 ML-RANN package

Contents:

A pair style for using rapid atomistic neural network (RANN) potentials. These neural network potentials work by first generating a series of symmetry functions from the neighbor list and then using these values as the input layer of a neural network.

Authors:

This package was written by Christopher Barrett with contributions by Doyl Dickel, Mississippi State University.

Added in version 27May2021.

Supporting info:

- `src/ML-RANN: filenames -> commands`
 - *`pair_style rann`*
 - `examples/PACKAGES/rann`
-

8.1.62 ML-SNAP package

Contents:

A pair style for the spectral neighbor analysis potential (SNAP). SNAP is methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. Also several computes which analyze attributes of the potential.

Author: Aidan Thompson (Sandia).

Supporting info:

- `src/ML-SNAP: filenames -> commands`
 - *`pair_style snap`*
 - *`compute sna/atom`*
 - *`compute sna/grid`*
 - *`compute sna/grid/local`*
 - *`compute snad/atom`*
 - *`compute snav/atom`*
 - `examples/snap`
-

8.1.63 ML-UF3 package

Contents:

A pair style for the ultra-fast force field potentials (UF3). UF3 is a methodology for deriving a highly accurate classical potential which is fast to evaluate and is fitted to a large archives of quantum mechanical (DFT) data. The use of b-spline basis set in UF3 enables the rapid evaluation of 2-body and 3-body interactions.

Authors: Ajinkya C Hire (University of Florida), Hendrik Krass (University of Constance), Matthias Rupp (Luxembourg Institute of Science and Technology), Richard Hennig (University of Florida)

Supporting info:

- `src/ML-UF3`: filenames -> commands
- *`pair_style uf3`*
- `examples/uf3`
- <https://github.com/uf3/uf3>

8.1.64 MOFFF package

Contents:

Pair, angle and improper styles needed to employ the MOF-FF force field by Schmid and coworkers with LAMMPS. MOF-FF is a first principles derived force field with the primary aim to simulate MOFs and related porous framework materials, using spherical Gaussian charges. It is described in S. Bureekaew et al., Phys. Stat. Sol. B 2013, 250, 1128-1141. For the usage of MOF-FF see the example in the example directory as well as the [MOF+](#) website.

Author: Hendrik Heenen (Technical U of Munich), Rochus Schmid (Ruhr-University Bochum).

Supporting info:

- `src/MOFFF`: filenames -> commands
 - `src/MOFFF/README`
 - *`pair_style buck6d/coul/gauss`*
 - *`angle_style class2`*
 - *`angle_style cosine/buck6d`*
 - *`improper_style inversion/harmonic`*
 - `examples/PACKAGES/mofff`
-

8.1.65 MOLECULE package

Contents:

A large number of atom, pair, bond, angle, dihedral, improper styles that are used to model molecular systems with fixed covalent bonds. The pair styles include the Dreiding (hydrogen-bonding) and CHARMM force fields, and a TIP4P water model.

Supporting info:

- `src/MOLECULE`: filenames -> commands
- *`atom_style`*
- *`bond_style`*
- *`angle_style`*
- *`dihedral_style`*
- *`improper_style`*
- *`pair_style hbond/dreiding/lj`*
- *`pair_style lj/charmm/coul/charmm`*
- *`Howto bioFF`*
- `examples/cmap`
- `examples/dreiding`

- `examples/micelle`,
 - `examples/peptide`
 - `bench/in.chain`
 - `bench/in.rhodo`
-

8.1.66 MOLFILE package

Contents:

A *dump molfile* command which uses molfile plugins that are bundled with the **VMD** molecular visualization and analysis program, to enable LAMMPS to dump snapshots in formats compatible with various molecular simulation tools.

To use this package you must have the desired VMD plugins available on your system.

Note that this package only provides the interface code, not the plugins themselves, which will be accessed when requesting a specific plugin via the *dump molfile* command. Plugins can be obtained from a VMD installation which has to match the platform that you are using to compile LAMMPS for. By adding plugins to VMD, support for new file formats can be added to LAMMPS (or VMD or other programs that use them) without having to re-compile the application itself. More information about the VMD molfile plugins can be found at <https://www.ks.uiuc.edu/Research/vmd/plugins/molfile>.

Author: Axel Kohlmeyer (Temple U).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/MOLFILE`: filenames -> commands
 - `src/MOLFILE/README`
 - `lib/molfile/README`
 - *dump molfile*
-

8.1.67 NETCDF package

Contents:

Dump styles for writing NetCDF formatted dump files. NetCDF is a portable, binary, self-describing file format developed on top of HDF5. The file contents follow the AMBER NetCDF trajectory conventions (<https://ambermd.org/netcdf/nctraj.xhtml>), but include extensions.

To use this package you must have the NetCDF library available on your system.

Note that NetCDF files can be directly visualized with the following tools:

- **Ovito** (Ovito supports the AMBER convention and the extensions mentioned above)
- **VMD**

Author: Lars Pastewka (Karlsruhe Institute of Technology).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/NETCDF`: filenames -> commands
- `src/NETCDF/README`
- `lib/netcdf/README`
- *[dump netcdf](#)*

8.1.68 OPENMP package**Contents:**

Hundreds of pair, fix, compute, bond, angle, dihedral, improper, and kspace styles which are altered to enable threading on many-core CPUs via OpenMP directives. All of them have an “omp” in their style name. The *[OPENMP package](#)* page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the `-sf omp` or `-suffix omp` *command-line switches*. Also see the *[KOKKOS](#)*, *[OPT](#)*, and *[INTEL](#)* packages, which have styles optimized for CPUs.

Author: Axel Kohlmeyer (Temple U).

Note

To enable multi-threading support the compile flag `-fopenmp` and the link flag `-fopenmp` (for GNU compilers, you have to look up the equivalent flags for other compilers) must be used to build LAMMPS. When using Intel compilers, also the `-restrict` flag is required. The OPENMP package can be compiled without enabling OpenMP; then all code will be compiled as serial and the only improvement over the regular styles are some data access optimization. These flags should be added to the CCFLAGS and LINKFLAGS lines of your Makefile.machine. See `src/MAKE/OPTIONS/Makefile.omp` for an example.

Once you have an appropriate Makefile.machine, you can install/uninstall the package and build LAMMPS in the usual manner:

Install:

This package has *specific installation instructions* on the *[Build extras](#)* page.

Supporting info:

- `src/OPENMP`: filenames -> commands
- `src/OPENMP/README`
- *[Accelerator packages](#)*
- *[OPENMP package](#)*
- *Command-line option* `-suffix/-sf omp`
- *Command-line option* `-package/-pk omp`
- *[package omp](#)*
- Search the *commands* pages (*fix*, *compute*, *pair*, *bond*, *angle*, *dihedral*, *improper*, *kspace*) for styles followed by (o)
- *[Benchmarks](#)* page of website

8.1.69 OPT package

Contents:

A handful of pair styles which are optimized for improved CPU performance on single or multiple cores. These include EAM, LJ, CHARMM, and Morse potentials. The styles have an “opt” suffix in their style name. The *OPT package* page gives details of how to build and use this package. Its styles can be invoked at run time via the `-sf opt` or `-suffix opt` *command-line switches*. See also the *KOKKOS*, *INTEL*, and *OPENMP* packages, which have styles optimized for CPU performance.

Authors: James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technology).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/OPT`: filenames -> commands
- *Accelerator packages*
- *OPT package*
- *Section 4.2 -sf opt*
- Search the *pair style* page for styles followed by (t)
- *Benchmarks* page of website

8.1.70 ORIENT package

Contents:

A few fixes that apply orientation dependent forces for studying grain boundary migration.

Supporting info:

- `src/ORIENT`: filenames -> commands
 - *fix orient/bcc*
 - *fix orient/fcc*
 - *fix orient/eco*
-

8.1.71 PERI package

Contents:

An atom style, several pair styles which implement different Peridynamics materials models, and several computes which calculate diagnostics. Peridynamics is a particle-based meshless continuum model.

Authors: The original package was created by Mike Parks (Sandia). Additional Peridynamics models were added by Rezwanur Rahman and John Foster (UTSA).

Supporting info:

- `src/PERI`: filenames -> commands
- *Peridynamics Howto*
- `doc/PDF/PDLammps_overview.pdf`

- [doc/PDF/PDLammps_EPS.pdf](#)
 - [doc/PDF/PDLammps_VES.pdf](#)
 - [atom_style peri](#)
 - [pair_style peri/*](#)
 - [compute damage/atom](#)
 - [compute plasticity/atom](#)
 - [examples/peri](#)
 - <https://www.lammps.org/movies.html#impact>
-

8.1.72 PHONON package

Contents:

A *fix phonon* command that calculates dynamical matrices, which can then be used to compute phonon dispersion relations, directly from molecular dynamics simulations. And a *dynamical_matrix* as well as a *third_order* command to compute the dynamical matrix and third order tensor from finite differences.

Install:

The fix phonon command also requires that the *KSPACE* package is installed.

Authors: Ling-Ti Kong (Shanghai Jiao Tong University) for “fix phonon” and Charlie Sievers (UC Davis) for “dynamical_matrix” and “third_order”

Supporting info:

- [src/PHONON: filenames -> commands](#)
 - [src/PHONON/README](#)
 - [fix phonon](#)
 - [dynamical_matrix](#)
 - [third_order](#)
 - [examples/PACKAGES/phonon](#)
-

8.1.73 PLUGIN package

Contents:

A *plugin* command that can load and unload several kind of styles in LAMMPS from shared object files at runtime without having to recompile and relink LAMMPS.

When the environment variable LAMMPS_PLUGIN_PATH is set, then LAMMPS will search the directory (or directories) listed in this path for files with names that end in `plugin.so` (e.g. `helloplugin.so`) and will try to load the contained plugins automatically at start-up.

Authors: Axel Kohlmeyer (Temple U)

Added in version 8Apr2021.

Supporting info:

- [src/PLUGIN: filenames -> commands](#)

- *plugin command*
 - *Information on writing plugins*
 - `examples/plugin`
-

8.1.74 PLUMED package

Contents:

The `fix plumed` command allows you to use the PLUMED free energy plugin for molecular dynamics to analyze and bias your LAMMPS trajectory on the fly. The PLUMED library is called from within the LAMMPS input script by using the *fix plumed* command.

Authors: The *PLUMED library* is written and maintained by Massimiliano Bonomi, Giovanni Bussi, Carlo Camilioni, and Gareth Tribello.

Install:

This package has *specific installation instructions* on the *Build extras* page. This package may also be compiled as a plugin to avoid licensing conflicts when distributing binaries.

Supporting info:

- `src/PLUMED/README`
 - `lib/plumed/README`
 - *fix plumed*
 - `examples/PACKAGES/plumed`
-

8.1.75 PTM package

Contents:

A *compute ptm/atom* command that calculates local structure characterization using the Polyhedral Template Matching methodology.

Author: Peter Mahler Larsen (MIT).

Supporting info:

- `src/PTM`: filenames not starting with `ptm_` -> commands
 - `src/PTM`: filenames starting with `ptm_` -> supporting code
 - `src/PTM/LICENSE`
 - *compute ptm/atom*
-

8.1.76 PYTHON package

Contents:

A *python* command which allow you to execute Python code from a LAMMPS input script. The code can be in a separate file or embedded in the input script itself. See the *Python call* page for an overview of using Python from LAMMPS in this manner and all the *Python* manual pages for other ways to use LAMMPS and Python together.

Note

Building with the PYTHON package assumes you have a Python development environment (headers and libraries) available on your system, which needs to be Python version 3.6 or later.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/PYTHON`: filenames -> commands
- *Python call*
- `lib/python/README`
- `examples/python`

8.1.77 QEQ package

Contents:

Several fixes for performing charge equilibration (QEq) via different algorithms. These can be used with pair styles that perform QEq as part of their formulation.

Supporting info:

- `src/QEQ`: filenames -> commands
- *fix qeq/**
- `examples/qeq`
- `examples/streitz`

8.1.78 QMMM package

Contents:

A *fix qmmm* command which allows LAMMPS to be used as the MM code in a QM/MM simulation. This is currently only available in combination with the *Quantum ESPRESSO* package.

To use this package you must have Quantum ESPRESSO (QE) available on your system and include its coupling library in the compilation and then compile LAMMPS as a library. For QM/MM calculations you then build a custom binary with MPI support, that sets up 3 partitions with MPI sub-communicators (for inter- and intra-partition communication) and then calls the corresponding library interfaces on each partition (2x LAMMPS and 1x QE).

The current implementation supports an ONIOM style mechanical coupling and a multi-pole based electrostatic coupling to the Quantum ESPRESSO plane wave DFT package. The QM/MM interface has been written in a manner that coupling to other QM codes should be possible without changes to LAMMPS itself.

Authors: Axel Kohlmeyer (Temple U), Mariella Ippolito and Carlo Cavazzoni (CINECA, Italy)

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/QMMM: filenames -> commands`
 - `src/QMMM/README`
 - `lib/qmmm/README`
 - *[fix phonon](#)*
 - `lib/qmmm/example-ec/README`
 - `lib/qmmm/example-mc/README`
-

8.1.79 QTB package

Contents:

Two fixes which provide a self-consistent quantum treatment of vibrational modes in a classical molecular dynamics simulation. By coupling the MD simulation to a colored thermostat, it introduces zero point energy into the system, altering the energy power spectrum and the heat capacity to account for their quantum nature. This is useful when modeling systems at temperatures lower than their classical limits or when temperatures ramp across the classical limits in a simulation.

Author: Yuan Shen (Stanford U).

Supporting info:

- `src/QTB: filenames -> commands`
 - `src/QTB/README`
 - *[fix qtb](#)*
 - *[fix qbmsst](#)*
 - `examples/PACKAGES/qtb`
-

8.1.80 REACTION package

Contents:

This package implements the REACTER protocol, which allows for complex bond topology changes (reactions) during a running MD simulation when using classical force fields. Topology changes are defined in pre- and post-reaction molecule templates and can include creation and deletion of bonds, angles, dihedrals, impropers, atom types, bond types, angle types, dihedral types, improper types, and/or atomic charges. Other options currently available include reaction constraints (e.g., angle and Arrhenius constraints), deletion of reaction byproducts or other small molecules, creation of new atoms or molecules bonded to existing atoms, and using LAMMPS variables for input parameters.

Author: Jacob R. Gissinger (NASA Langley Research Center).

Supporting info:

-

8.1.81 REAXFF package

Contents:

A pair style which implements the ReaxFF potential in C/C++. ReaxFF is a universal reactive force field. See the `src/REAXFF/README` file for more info on differences between the two packages. Also two fixes for monitoring molecules as bonds are created and destroyed.

Author: Hasan Metin Aktulga (MSU) while at Purdue University.

Supporting info:

- `src/REAXFF`: filenames -> commands
 - `src/REAXFF/README`
 - *pair_style reaxff*
 - *fix reaxff/bonds*
 - *fix reaxff/species*
 - `examples/reaxff`
-

8.1.82 REPLICA package

Contents:

A collection of multi-replica methods which can be used when running multiple LAMMPS simulations (replicas). See the *Howto replica* page for an overview of how to run multi-replica simulations in LAMMPS. Methods in the package include nudged elastic band (NEB), parallel replica dynamics (PRD), temperature accelerated dynamics (TAD), parallel tempering, and a verlet/split algorithm for performing long-range Coulombics on one set of processors, and the remainder of the force field calculation on another set.

Supporting info:

- `src/REPLICA`: filenames -> commands
- *Howto replica*
- *neb*
- *prd*
- *tad*
- *temper*,
- *temper/npt*,
- *temper/grem*,
- *run_style verlet/split*
- `examples/neb`
- `examples/prd`
- `examples/tad`

- [examples/PACKAGES/grem](#)
-

8.1.83 RHEO package

Contents:

Pair styles, bond styles, fixes, and computes for reproducing hydrodynamics and elastic objects. See the [Howto rheo](#) page for an overview.

Install:

This package has *specific installation instructions* on the [Build extras](#) page.

Authors: Joel T. Clemmer (Sandia National Labs), Thomas C. O'Connor (Carnegie Mellon University)

Added in version 29Aug2024.

Supporting info:

- [src/RHEO filenames -> commands](#)
 - [Howto_rheo](#)
 - [atom_style rheo](#)
 - [atom_style rheo/thermal](#)
 - [bond_style rheo/shell](#)
 - [compute rheo/property/atom](#)
 - [fix rheo](#)
 - [fix rheo/oxidation](#)
 - [fix rheo/pressure](#)
 - [fix rheo/thermal](#)
 - [fix rheo/viscosity](#)
 - [pair_style rheo](#)
 - [pair_style rheo/solid](#)
 - <https://www.lammps.org/movies.html#rheopackage>
 - [examples/rheo](#)
-

8.1.84 RIGID package

Contents:

Fixes which enforce rigid constraints on collections of atoms or particles. This includes SHAKE and RATTLE, as well as various rigid-body integrators for a few large bodies or many small bodies. Also several computes which calculate properties of rigid bodies.

Supporting info:

- [src/RIGID: filenames -> commands](#)
- [compute erotate/rigid](#)
- [fix shake](#)

- [fix rattle](#)
 - [fix rigid/*](#)
 - [examples/ASPHERE](#)
 - [examples/rigid](#)
 - [bench/in.rhodo](#)
 - <https://www.lammps.org/movies.html#box>
 - <https://www.lammps.org/movies.html#star>
-

8.1.85 SCAFACOS package

Contents:

A KSpace style which wraps the [ScaFaCoS Coulomb solver library](#) to compute long-range Coulombic interactions.

To use this package you must have the ScaFaCoS library available on your system.

Author: Rene Halver (JSC) wrote the scafacos LAMMPS command.

ScaFaCoS itself was developed by a consortium of German research facilities with a BMBF (German Ministry of Science and Education) funded project in 2009-2012. Participants of the consortium were the Universities of Bonn, Chemnitz, Stuttgart, and Wuppertal as well as the Forschungszentrum Juelich.

Install:

This package has *specific installation instructions* on the [Build extras](#) page. The SCAFACOS package requires that LAMMPS is built in *MPI parallel mode*.

Supporting info:

- [src/SCAFACOS: filenames -> commands](#)
 - [src/SCAFACOS/README](#)
 - [kspace_style scafacos](#)
 - [kspace_modify](#)
 - [examples/PACKAGES/scafacos](#)
-

8.1.86 SHOCK package

Contents:

Fixes for running impact simulations where a shock-wave passes through a material.

Supporting info:

- [src/SHOCK: filenames -> commands](#)
- [fix append/atoms](#)
- [fix msst](#)
- [fix np Hug](#)
- [fix wall/piston](#)
- [examples/hugonostat](#)

- `examples/msst`
-

8.1.87 SMTBQ package

Contents:

Pair styles which implement Second Moment Tight Binding models. One with QEq charge equilibration (SMTBQ) for the description of ionocovalent bonds in oxides, and two more as plain SMATB models.

Authors: SMTBQ: Nicolas Salles, Emile Maras, Olivier Politano, and Robert Tetot (LAAS-CNRS, France); SMATB: Daniele Rapetti (Politecnico di Torino)

Supporting info:

- `src/SMTBQ: filenames -> commands`
 - `src/SMTBQ/README`
 - *`pair_style smtbq`*
 - *`pair_style smatb`, `pair_style smatb/single`*
 - `examples/PACKAGES/smtbq`
-

8.1.88 SPH package

Contents:

An atom style, fixes, computes, and several pair styles which implements smoothed particle hydrodynamics (SPH) for liquids. See the related *MACHDYN package* for smooth Mach dynamics (SMD) for solids.

This package contains ideal gas, Lennard-Jones equation of states, Tait, and full support for complete (i.e. internal-energy dependent) equations of state. It allows for plain or Monaghans XSPH integration of the equations of motion. It has options for density continuity or density summation to propagate the density field. It has *set* command options to set the internal energy and density of particles from the input script and allows the same quantities to be output with thermodynamic output or to dump files via the *compute property/atom* command.

Author: Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

Supporting info:

- `src/SPH: filenames -> commands`
- `src/SPH/README`
- `doc/PDF/SPH_LAMMPS_userguide.pdf`
- `examples/PACKAGES/sph`
- <https://www.lammps.org/movies.html#sph>

Note

Please note that the SPH PDF guide file has not been updated for many years and thus does not reflect the current *syntax* of the SPH package commands. For that please refer to the LAMMPS manual.

Note

Please also note, that the *RHEO package* offers similar functionality in a more modern and flexible implementation.

8.1.89 SPIN package

Contents:

Model atomic magnetic spins classically, coupled to atoms moving in the usual manner via MD. Various pair, fix, and compute styles.

Author: Julien Tranchida (Sandia).

Supporting info:

- `src/SPIN`: filenames -> commands
 - *Howto spins*
 - *pair_style spin/dipole/cut*
 - *pair_style spin/dipole/long*
 - *pair_style spin/dmi*
 - *pair_style spin/exchange*
 - *pair_style spin/exchange/biquadratic*
 - *pair_style spin/magelec*
 - *pair_style spin/neel*
 - *fix nve/spin*
 - *fix langevin/spin*
 - *fix precession/spin*
 - *compute spin*
 - *neb/spin*
 - `examples/SPIN`
-

8.1.90 SRD package

Contents:

A pair of fixes which implement the Stochastic Rotation Dynamics (SRD) method for coarse-graining of a solvent, typically around large colloidal particles.

Supporting info:

- `src/SRD`: filenames -> commands
- *fix srd*
- *fix wall/srd*
- `examples/srd`

- `examples/ASPHERE`
 - <https://www.lammps.org/movies.html#tri>
 - <https://www.lammps.org/movies.html#line>
 - <https://www.lammps.org/movies.html#poly>
-

8.1.91 TALLY package

Contents:

Several compute styles that can be called when pairwise interactions are calculated to tally information (forces, heat flux, energy, stress, etc) about individual interactions.

Author: Axel Kohlmeyer (Temple U).

Supporting info:

- `src/TALLY`: filenames -> commands
 - `src/TALLY/README`
 - *compute */tally*
 - `examples/PACKAGES/tally`
-

8.1.92 UEF package

Contents:

A fix style for the integration of the equations of motion under extensional flow with proper boundary conditions, as well as several supporting compute styles and an output option.

Author: David Nicholson (MIT).

Supporting info:

- `src/UEF`: filenames -> commands
 - `src/UEF/README`
 - *fix nvt/uef*
 - *fix npt/uef*
 - *compute pressure/uef*
 - *compute temp/uef*
 - *dump cfg/uef*
 - `examples/uef`
-

8.1.93 VORONOI package

Contents:

A `compute` command which calculates the Voronoi tessellation of a collection of atoms by wrapping the [Voro++ library](#). This can be used to calculate the local volume of atoms or their near neighbors.

To use this package you must have the Voro++ library available on your system.

Author: Daniel Schwen (INL) while at LANL. The open-source Voro++ library was written by Chris Rycroft (Harvard U) while at UC Berkeley and LBNL.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/VORONOI`: filenames -> commands
 - `src/VORONOI/README`
 - `lib/voronoi/README`
 - *`compute voronoi/atom`*
 - `examples/voronoi`
-

8.1.94 VTK package

Contents:

A *`dump vtk`* command which outputs snapshot info in the [VTK format](#), enabling visualization by [Paraview](#) or other visualization packages.

To use this package you must have VTK library available on your system.

Authors: Richard Berger (JKU) and Daniel Queteschner (DCS Computing).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/VTK`: filenames -> commands
 - `src/VTK/README`
 - `lib/vtk/README`
 - *`dump vtk`*
-

8.1.95 YAFF package

Contents:

Some potentials that are also implemented in the Yet Another Force Field (YAFF) code. The expressions and their use are discussed in the following papers

- Vanduyfhuys et al., J. Comput. Chem., 36 (13), 1015-1027 (2015) [link](#)
- Vanduyfhuys et al., J. Comput. Chem., 39 (16), 999-1011 (2018) [link](#)

which discuss the [QuickFF](#) methodology.

Author: Steven Vandenbrande.

Added in version 1Feb2019.

Supporting info:

- `src/YAFF/README`
- *`angle_style cross`*
- *`angle_style mm3`*
- *`bond_style mm3`*
- *`improper_style distharm`*
- *`improper_style sqdistharm`*
- *`pair_style mm3/switch3/coulgauss/long`*
- *`pair_style lj/switch3/coulgauss/long`*
- `examples/PACKAGES/yaff`

AUXILIARY TOOLS

LAMMPS is designed to be a computational kernel for performing molecular dynamics computations. Additional pre- and post-processing steps are often necessary to setup and analyze a simulation. A list of such tools can be found on the [LAMMPS webpage](#) at these links:

- [Pre/Post processing](#)
- [External LAMMPS packages & tools](#)
- [Pizza.py toolkit](#)

The last link for [Pizza.py](#) is a Python-based tool developed at Sandia which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations.

Additional tools included in the LAMMPS distribution are described on this page.

Note that many users write their own setup or analysis tools or use other existing codes and convert their output to a LAMMPS input format or vice versa. The tools listed here are included in the LAMMPS distribution as examples of auxiliary tools. Some of them are not actively supported by the LAMMPS developers, as they were contributed by LAMMPS users. If you have problems using them, we can direct you to the authors.

The source code for each of these codes is in the tools subdirectory of the LAMMPS distribution. There is a Makefile (which you may need to edit for your platform) which will build several of the tools which reside in that directory. Most of them are larger packages in their own subdirectories with their own Makefiles and/or README files.

9.1 Pre-processing tools

<i>ch2lmp</i>	<i>chain</i>	<i>createatoms</i>	<i>drude</i>	<i>eam database</i>	<i>eam generate</i>
<i>eff</i>	<i>ipp</i>	<i>micelle2d</i>	<i>moltemplate</i>	<i>msi2lmp</i>	<i>polybond</i>
<i>stl_bin2txt</i>	<i>tabulate</i>	<i>tinker</i>	<i>AMBER2LAMMPS</i>		

9.2 Post-processing tools

<i>binary2txt</i>	<i>ch2lmp</i>	<i>colvars</i>	<i>eff</i>	<i>fep</i>	<i>lmp2arc</i>
<i>lmp2cfg</i>	<i>matlab</i>	<i>phonon</i>	<i>pymol_asphere</i>	<i>python</i>	<i>replica</i>
<i>smd</i>	<i>spin</i>	<i>xmgrace</i>			

9.3 Miscellaneous tools

<i>LAMMPS magic patterns for file(1)</i>	<i>Offline build tool</i>	<i>Regression tester</i>	<i>singularity/apptainer</i>	<i>SWIG interface</i>	<i>valgrind</i>
<i>vim</i>					

9.4 Tool descriptions

9.4.1 binary2txt tool

The file `binary2txt.cpp` converts one or more binary LAMMPS dump file into ASCII text files. The syntax for running the tool is

```
binary2txt file1 file2 ...
```

which creates `file1.txt`, `file2.txt`, etc. This tool must be compiled on a platform that can read the binary file created by a LAMMPS run, since binary files are not compatible across all platforms.

9.4.2 ch2lmp tool

The `ch2lmp` subdirectory contains tools for converting files back-and-forth between the CHARMM MD code and LAMMPS.

They are intended to make it easy to use CHARMM as a builder and as a post-processor for LAMMPS. Using `charmm2lammps.pl`, you can convert a PDB file with associated CHARMM info, including CHARMM force field data, into its LAMMPS equivalent. Support for the CMAP correction of CHARMM22 and later is available as an option. This tool can also add solvent water molecules and Na⁺ or Cl⁻ ions to the system. Using `lammps2pdb.pl` you can convert LAMMPS atom dumps into PDB files.

See the README file in the `ch2lmp` subdirectory for more information.

These tools were created by Pieter in't Veld (`pjintve at sandia.gov`) and Paul Crozier (`pscrozi at sandia.gov`) at Sandia. CMAP support added and tested by Xiaohu Hu (`hux2 at ornl.gov`) and Robert A. Latour (`latourr at clemson.edu`), David Hyde-Volpe, and Tigran Abramyan, (Clemson University) and Chris Lorenz (`chris.lorenz at kcl.ac.uk`), King's College London.

9.4.3 chain tool

The file `chain.f90` creates a LAMMPS data file containing bead-spring polymer chains and/or monomer solvent atoms. It uses a text file containing chain definition parameters as an input. The created chains and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a “soft” pair potential to un-overlap it. The syntax for running the tool is

```
chain < def.chain > data.file
```

See the `def.chain` or `def.chain.ab` files in the tools directory for examples of definition files. This tool was used to create the system for the *chain benchmark*.

9.4.4 LAMMPS coding standard

The `coding_standard` folder contains multiple python scripts to check for and apply some LAMMPS coding conventions. The following scripts are available:

```
permissions.py # detects if sources have executable permissions and scripts have not
whitespace.py  # detects TAB characters and trailing whitespace
homepage.py    # detects outdated LAMMPS homepage URLs (pointing to sandia.gov instead
↳of lammps.org)
errordocs.py   # detects deprecated error docs in header files
versiontags.py # detects .. versionadded:: or .. versionchanged:: with pending version
↳date
```

The tools need to be given the main folder of the LAMMPS distribution or individual file names as argument and will by default check them and report any non-compliance. With the optional `-f` argument the corresponding script will try to change the non-compliant file(s) to match the conventions.

For convenience this scripts can also be invoked by the make file in the `src` folder with, *make check-whitespace* or *make fix-whitespace* to either detect or edit the files. Correspondingly for the other python scripts. *make check* will run all checks.

9.4.5 colvars tools

The `colvars` directory contains a collection of tools for post-processing data produced by the `colvars` collective variable library. To compile the tools, edit the makefile for your system and run “make”.

Please report problems and issues the `colvars` library and its tools at: <https://github.com/colvars/colvars/issues>

`abf_integrate`:

MC-based integration of multidimensional free energy gradient Version 20110511

```
./abf_integrate < filename > [-n < nsteps >] [-t < temp >] [-m [0|1] (metadynamics)] [-h
↳< hill_height >] [-f < variable_hill_factor >]
```

The LAMMPS interface to the `colvars` collective variable library, as well as these tools, were created by Axel Kohlmeyer (akohlmeier at gmail.com) while at ICTP, Italy.

9.4.6 createatoms tool

The `tools/createatoms` directory contains a Fortran program called `createAtoms.f` which can generate a variety of interesting crystal structures and geometries and output the resulting list of atom coordinates in LAMMPS or other formats.

See the included `Manual.pdf` for details.

The tool is authored by Xiaowang Zhou (Sandia), `xzhou at sandia.gov`.

9.4.7 drude tool

The `tools/drude` directory contains a Python script called `polarizer.py` which can add Drude oscillators to a LAMMPS data file in the required format.

See the header of the `polarizer.py` file for details.

The tool is authored by Agilio Padua and Alain Dequidt: `agilio.padua at ens-lyon.fr`, `alain.dequidt at uca.fr`

9.4.8 eam database tool

The tools/eam_database directory contains a Fortran and a Python program that will generate EAM alloy setfl potential files for any combination of the 17 elements: Cu, Ag, Au, Ni, Pd, Pt, Al, Pb, Fe, Mo, Ta, W, Mg, Co, Ti, Zr, Cr. The files can then be used with the *pair_style eam/alloy* command.

The Fortran version of the tool was authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov, with updates from Lucas Hale (NIST) lucas.hale at nist.gov and is based on his paper:

X. W. Zhou, R. A. Johnson, and H. N. G. Wadley, Phys. Rev. B, 69, 144113 (2004).

The parameters for Cr were taken from:

Lin Z B, Johnson R A and Zhigilei L V, Phys. Rev. B 77 214108 (2008).

The Python version of the tool was authored by Germain Clavier (Unicaen) germain.clavier at unicaen.fr

Note

The parameters in the database are only optimized for individual elements. The mixed parameters for interactions between different elements generated by this tool are derived from simple mixing rules and are thus inferior to parameterizations that are specifically optimized for specific mixtures and combinations of elements.

9.4.9 eam generate tool

The tools/eam_generate directory contains several one-file C programs that convert an analytic formula into a tabulated *embedded atom method (EAM)* setfl potential file. The potentials they produce are in the potentials directory, and can be used with the *pair_style eam/alloy* command.

The source files and potentials were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com).

9.4.10 eff tool

The tools/eff directory contains various scripts for generating structures and post-processing output for simulations using the electron force field (eFF).

These tools were provided by Andres Jaramillo-Botero at CalTech (ajaramil at wag.caltech.edu).

9.4.11 emacs tool

The tools/emacs directory contains an Emacs Lisp add-on file for GNU Emacs that enables a lammps-mode for editing input scripts when using GNU Emacs, with various highlighting options set up.

These tools were provided by Aidan Thompson at Sandia (athomps at sandia.gov).

9.4.12 fep tool

The tools/fep directory contains Python scripts useful for post-processing results from performing free-energy perturbation simulations using the FEP package.

The scripts were contributed by Agilio Padua (ENS de Lyon), agilio.padua@ens-lyon.fr.

See README file in the tools/fep directory.

9.4.13 i-PI tool

Changed in version 27June2024.

The tools/i-pi directory used to contain a bundled version of the i-PI software package for use with LAMMPS. This version, however, was removed in 06/2024.

The i-PI package was created and is maintained by Michele Ceriotti, michele.ceriotti@gmail.com, to interface to a variety of molecular dynamics codes.

i-PI is now available via PyPI using the pip package manager at: <https://pypi.org/project/ipi/>

Here are the commands to set up a virtual environment and install i-PI into it with all its dependencies.

```
python -m venv ipienv
source ipienv/bin/activate
pip install --upgrade pip
pip install ipi
```

To install the development version from GitHub, please use:

```
pip install git+https://github.com/i-pi/i-pi.git
```

For further information, please consult the [i-PI home page](<https://ipi-code.org>).

9.4.14 ipp tool

The tools/ipp directory contains a Perl script ipp which can be used to facilitate the creation of a complicated file (say, a LAMMPS input script or tools/createatoms input file) using a template file.

ipp was created and is maintained by Reese Jones (Sandia), rjones@sandia.gov.

See two examples in the tools/ipp directory. One of them is for the tools/createatoms tool's input file.

9.4.15 JSON support files

Added in version 12June2025.

The tools/json directory contains files and tools to support using JSON format files in LAMMPS. Currently only the *molecule command* supports files in JSON format directly, but this is planned to be expanded in the future.

JSON file validation

The JSON syntax is independent of its content, and thus the data in the file must follow suitable conventions to be correctly parsed during input. This can be done in a portable fashion using a [JSON schema file](#) (which is in JSON format as well) to define those conventions. A suitable JSON validator software can then validate JSON files against the requirements. Validating a particular JSON file against a schema ensures that both, the syntax *and* the conventions are followed. This is useful when writing or editing JSON files in a text editor or when writing a pre-processing script or tool to create JSON files for a specific purpose in LAMMPS. It **cannot** check whether the file contents are physically meaningful, though.

One such validator tool is [check-jsonschema](#) which is written in Python and can be installed using the [pip Python package manager](#), best in a virtual environment as shown below (for a Bourne Shell command line):

```
python -m venv validate-json
source validate-json/bin/activate
pip install --upgrade pip
pip install check-jsonschema
```

To validate a specific JSON file against a provided schema (here for a [molecule command file](#) you would then run for example:

```
check-jsonschema --schemafile molecule-schema.json tip3p.json
```

The latest schema files are also maintained and available for download at <https://download.lammps.org/json/> . This enables validation of JSON files even if the LAMMPS sources are not locally available. Example:

```
check-jsonschema --schemafile https://download.lammps.org/json/molecule-schema.json \
→ tip3p.json
```

Because YAML is a superset of JSON, the same tool and mechanism can also validate YAML files against a JSON schema. This is used for the force-style regression test reference files in the `unittest/force-styles` folder, which are described by `force-style-test-schema.json`. For example, to validate all of them:

```
check-jsonschema --schemafile force-style-test-schema.json \
  unittest/force-styles/tests/*.yaml
```

See the [unit test developer documentation](#) for a description of the available keys in these reference files.

JSON file format normalization

There are extensions to the strict JSON format that allow for comments or ignore additional (dangling) commas. The `reformat-json.cpp` tool will read JSON files in relaxed format, but write it out in strict format. It is also possible to change the level of indentation from -1 (all data one long line) to any positive integer value. The original file will be backed up (.bak added to file name) and then overwritten.

Manual compilation (it will be automatically included in the CMake build if building tools is requested during CMake configuration):

```
g++ -I <path/to/lammps/src> -o reformat-json reformat-json.cpp
```

Usage:

```
reformat-json <indent-width> <json-file-1> [<json-file-2> ...]
```

9.4.16 kate tool

The file in the tools/kate directory is an add-on to the Kate editor in the KDE suite that allow syntax highlighting of LAMMPS input scripts. See the README.txt file for details.

The file was provided by Alessandro Luigi Sellerio (alessandro.sellerio at ieni.cnr.it).

9.4.17 LAMMPS-GUI

Changed in version 10Sep2025.

LAMMPS-GUI is a graphical text editor customized for editing LAMMPS input files that is linked to the *LAMMPS C-library*. It used to be included with LAMMPS in the tools/lammps-gui folder, but it is now hosted in its own git repository at <https://github.com/akohlmei/lammps-gui/> and the online documentation is at <https://lammps-gui.lammps.org/>

It is still possible to compile *LAMMPS-GUI together with LAMMPS*.

9.4.18 Imp2arc tool

The Imp2arc subdirectory contains a tool for converting LAMMPS output files to the format for Accelrys' Insight MD code (formerly MSI/Biosym and its Discover MD code). See the README file for more information.

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). John is now at the Mayo Clinic (jec at mayo.edu), but still fields questions about the tool.

This tool was updated for the current LAMMPS C++ version by Jeff Greathouse at Sandia (jagreat at sandia.gov).

9.4.19 Imp2cfg tool

The Imp2cfg subdirectory contains a tool for converting LAMMPS output files into a series of *.cfg files which can be read into the AtomEye visualizer. See the README file for more information.

This tool was written by Ara Kooser at Sandia (askoose at sandia.gov).

9.4.20 Magic patterns for the “file” command

Added in version 10Mar2021.

The file magic contains patterns that are used by the *file* program available on most Unix-like operating systems which enables it to detect various LAMMPS files and print some useful information about them. To enable these patterns, append or copy the contents of the file *.magic* in your home directory or (as administrator) to /etc/magic (for a system-wide installation). Afterwards the *file* command should be able to detect most LAMMPS restarts, dump, data and log files. Examples:

```
$ file *.*
dihedral-quadratic.restart:  LAMMPS binary restart file (rev 2), Version 10 Mar 2021, ↵
↵Little Endian
mol-pair-wf_cut.restart:    LAMMPS binary restart file (rev 2), Version 24 Dec 2020, ↵
↵Little Endian
atom.bin:                   LAMMPS atom style binary dump (rev 2), Little Endian, ↵
```

(continues on next page)

(continued from previous page)

```
→First time step: 445570
custom.bin:                LAMMPS custom style binary dump (rev 2), Little Endian,
→First time step: 100
bn1.lammpstrj:             LAMMPS text mode dump, First time step: 5000
data.fourmol:              LAMMPS data file written by LAMMPS
pnc.data:                  LAMMPS data file written by msi2lmp
data.spce:                 LAMMPS data file written by TopoTools
B.data:                    LAMMPS data file written by OVITO
log.lammps:                LAMMPS log file written by version 10 Feb 2021
```

9.4.21 matlab tool

The matlab subdirectory contains several [MATLAB](#) scripts for post-processing LAMMPS output. The scripts include readers for log and dump files, a reader for EAM potential files, and a converter that reads LAMMPS dump files and produces CFG files that can be visualized with the [AtomEye](#) visualizer.

See the [README.pdf](#) file for more information.

These scripts were written by Arun Subramaniyan at Purdue Univ (asubrama@purdue.edu).

9.4.22 micelle2d tool

The file `micelle2d.f` creates a LAMMPS data file containing short lipid chains in a monomer solution. It uses a text file containing lipid definition parameters as an input. The created molecules and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a “soft” pair potential to un-overlap it. The syntax for running the tool is

```
micelle2d < def.micelle2d > data.file
```

See the `def.micelle2d` file in the tools directory for an example of a definition file. This tool was used to create the system for the *micelle example*.

9.4.23 moltemplate tool

The moltemplate subdirectory contains instructions for installing moltemplate, a Python-based tool for building molecular systems based on a text-file description, and creating LAMMPS data files that encode their molecular topology as lists of bonds, angles, dihedrals, etc. See the [README.txt](#) file for more information.

This tool was written by Andrew Jewett (jewett.aj@gmail.com), who supports it. It has its own WWW page at <https://moltemplate.org>. The latest sources can be found on its [GitHub page](#)

9.4.24 msi2lmp tool

The msi2lmp subdirectory contains a tool for creating LAMMPS template input and data files from BIOVIA’s *Materials Studio* files (formerly Accelrys’ *Insight MD* code, formerly *MSI/Biosym* and its *Discover MD* code).

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). Several people contributed changes to remove bugs and adapt its output to changes in LAMMPS.

This tool has several known limitations and is no longer under active development, so there are no changes except for the occasional bug fix.

See the README file in the tools/msi2lmp folder for more information.

9.4.25 Scripts for building LAMMPS when offline

In some situations it might be necessary to build LAMMPS on a system without direct internet access. The scripts in tools/offline folder allow you to pre-load external dependencies for both the documentation build and for building LAMMPS with CMake.

It does so by

1. downloading necessary `pip` packages,
2. cloning `git` repositories
3. downloading tarballs

to a designated cache folder.

As of April 2021, all of these downloads make up around 600MB. By default, the offline scripts will download everything into the `$HOME/.cache/lammps` folder, but this can be changed by setting the `LAMMPS_CACHING_DIR` environment variable.

Once the caches have been initialized, they can be used for building the LAMMPS documentation or compiling LAMMPS using CMake on an offline system.

The `use_caches.sh` script must be sourced into the current shell to initialize the offline build environment. Note that it must use the same `LAMMPS_CACHING_DIR`. This script does the following:

1. Set up environment variables that modify the behavior of both, `pip` and `git`
2. Start a simple local HTTP server using Python to host files for CMake

Afterwards, it will print out instructions on how to modify the CMake commands to make sure it uses the local HTTP server.

To undo the environment changes and shutdown the local HTTP server, run the `deactivate_caches` command.

Examples

For all of the examples below, you first need to create the cache, which requires an internet connection.

```
./tools/offline/init_caches.sh
```

Afterwards, you can disconnect or copy the contents of the `LAMMPS_CACHING_DIR` folder to an offline system.

Documentation Build

The documentation build will create a new virtual environment that typically first installs dependencies from `pip`. With the offline environment loaded, these installations will instead grab the necessary packages from your local cache.

```
# if LAMMPS_CACHING_DIR is different from default, make sure to set it first
# export LAMMPS_CACHING_DIR=path/to/folder
source tools/offline/use_caches.sh
cd doc/
make html

deactivate_caches
```

CMake Build

When compiling certain packages with external dependencies, the CMake build system will download necessary files or sources from the web. For more flexibility the CMake configuration allows users to specify the URL of each of these dependencies. What the `init_caches.sh` script does is create a CMake “preset” file, which sets the URLs for all of the known dependencies and redirects the download to the local cache.

```
# if LAMMPS_CACHING_DIR is different from default, make sure to set it first
# export LAMMPS_CACHING_DIR=path/to/folder
source tools/offline/use_caches.sh

mkdir build
cd build
cmake -D LAMMPS_DOWNLOADS_URL=${HTTP_CACHE_URL} -C "${LAMMPS_HTTP_CACHE_CONFIG}" -C ../
→cmake/presets/most.cmake -D DOWNLOAD_POTENTIALS=off ../cmake
make -j 8

deactivate_caches
```

9.4.26 phonon tool

The phonon subdirectory contains a post-processing tool, *phana*, useful for analyzing the output of the *fix phonon* command in the PHONON package.

See the README file for instructions on building the tool and what library it needs. And see the examples/PACKAGES/phonon directory for example problems that can be post-processed with this tool.

This tool was written by Ling-Ti Kong at Shanghai Jiao Tong University.

9.4.27 polybond tool

The polybond subdirectory contains a Python-based tool useful for performing “programmable polymer bonding”. The Python file `lmpsdata.py` provides a “Lmpsdata” class with various methods which can be invoked by a user-written Python script to create data files with complex bonding topologies.

See the Manual.pdf for details and example scripts.

This tool was written by Zachary Kraus at Georgia Tech.

9.4.28 pymol_asphere tool

The pymol_asphere subdirectory contains a tool for converting a LAMMPS dump file that contains orientation info for ellipsoidal particles into an input file for the [PyMol visualization package](#) or its [open source variant](#).

Specifically, the tool triangulates the ellipsoids so they can be viewed as true ellipsoidal particles within PyMol. See the README and examples directory within pymol_asphere for more information.

This tool was written by Mike Brown at Sandia.

9.4.29 python tool

The python subdirectory contains several Python scripts that perform common LAMMPS post-processing tasks, such as:

- extract thermodynamic info from a log file as columns of numbers
- plot two columns of thermodynamic info from a log file using GnuPlot
- sort the snapshots in a dump file by atom ID
- convert multiple *NEB* dump files into one dump file for viz
- convert dump files into XYZ, CFG, or PDB format for viz by other packages

These are simple scripts built on [Pizza.py](#) modules. See the README for more info on Pizza.py and how to use these scripts.

9.4.30 Regression tester tool

The regression-tests subdirectory contains a tool for performing regression tests with a given LAMMPS binary. The tool launches the LAMMPS binary with any given input script under one of the *examples* subdirectories, and compares the thermo output in the generated log file with those in the provided log file with the same number of processors in the same subdirectory. If the differences between the actual and reference values are within specified tolerances, the test is considered passed. For each test batch, that is, a set of example input scripts, the `mpirun` command, the LAMMPS command-line arguments, and the tolerances for individual thermo quantities can be specified in a configuration file in YAML format.

The tool also reports if and how the run fails, and if a reference log file is missing. See the README file for more information.

This tool was written by Trung Nguyen at U of Chicago (ndactrung at gmail.com).

9.4.31 replica tool

The tools/replica directory contains the `reorder_remd_traj` python script which can be used to reorder the replica trajectories (resulting from the use of the `temper` command) according to temperature. This will produce discontinuous trajectories with all frames at the same temperature in each trajectory. Additional options can be used to calculate the canonical configurational log-weight for each frame at each temperature using the `pymbar` package. See the README.md file for further details. Try out the peptide example provided.

This tool was written by (and is maintained by) Tanmoy Sanyal, while at the Shell lab at UC Santa Barbara. (tanmoy dot 7989 at gmail.com)

9.4.32 smd tool

The smd subdirectory contains a C++ file `dump2vtk_tris.cpp` and Makefile which can be compiled and used to convert triangle output files created by the Smooth-Mach Dynamics (MACHDYN) package into a VTK-compatible unstructured grid file. It could then be read in and visualized by VTK.

See the header of `dump2vtk.cpp` for more details.

This tool was written by the MACHDYN package author, Georg Ganzenmuller at the Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute in Germany (georg.ganzenmueller at emi.fhg.de).

9.4.33 spin tool

The spin subdirectory contains a C file `interpolate.c` which can be compiled and used to perform a cubic polynomial interpolation of the MEP following a GNEB calculation.

See the README file in `tools/spin/interpolate_gneb` for more details.

This tool was written by the SPIN package author, Julien Tranchida at Sandia National Labs (`jtranch` at `sandia.gov`, and by Aleksei Ivanov, at University of Iceland (`ali5` at `hi.is`).

9.4.34 singularity/apptainer tool

The singularity subdirectory contains container definitions files that can be used to build container images for building and testing LAMMPS on specific OS variants using the [Apptainer](#) or [Singularity](#) container software. Contributions for additional variants are welcome. For more details please see the README.md file in that folder.

9.4.35 stl_bin2txt tool

The file `stl_bin2txt.cpp` converts binary STL files - like they are frequently offered for download on the web - into ASCII format STL files that LAMMPS can read with the `create_atoms mesh` or the `fix smd/wall_surface` commands. The syntax for running the tool is

```
stl_bin2txt infile.stl outfile.stl
```

which creates `outfile.stl` from `infile.stl`. This tool must be compiled on a platform compatible with the byte-ordering that was used to create the binary file. This usually is a so-called little endian hardware (like x86).

9.4.36 SWIG interface

The [SWIG tool](#) offers a mostly automated way to incorporate compiled code modules into scripting languages. It processes the function prototypes in C and generates wrappers for a wide variety of scripting languages from it. Thus it can also be applied to the [C language library interface](#) of LAMMPS so that build a wrapper that allows to call LAMMPS from programming languages like: C#/Mono, Lua, Java, JavaScript, Perl, Python, R, Ruby, Tcl, and more.

What is included

We provide here an “interface file”, `lammps.i`, that has the content of the `library.h` file adapted so SWIG can process it. That will create wrappers for all the functions that are present in the LAMMPS C library interface. Please note that not all kinds of C functions can be automatically translated, so you would have to add custom functions to be able to utilize those where the automatic translation does not work. A few functions for converting pointers and accessing arrays are predefined. We provide the file here on an “as is” basis to help people getting started, but not as a fully tested and supported feature of the LAMMPS distribution. Any contributions to complete this are, of course, welcome. Please also note, that for the case of creating a Python wrapper, a fully supported [Ctypes based lammps module](#) already exists. That module is designed to be object-oriented while SWIG will generate a 1:1 translation of the functions in the interface file.

Building the wrapper

When using CMake, the build steps for building a wrapper module are integrated for the languages: Java, Lua, Perl5, Python, Ruby, and Tcl. These require that the LAMMPS library is build as a shared library and all necessary development headers and libraries are present.

```
-D WITH_SWIG=on      # to enable building any SWIG wrapper
-D BUILD_SWIG_JAVA=on # to enable building the Java wrapper
-D BUILD_SWIG_LUA=on  # to enable building the Lua wrapper
-D BUILD_SWIG_PERL5=on # to enable building the Perl 5.x wrapper
-D BUILD_SWIG_PYTHON=on # to enable building the Python wrapper
-D BUILD_SWIG_RUBY=on  # to enable building the Ruby wrapper
-D BUILD_SWIG_TCL=on   # to enable building the Tcl wrapper
```

Manual building allows a little more flexibility. E.g. one can choose the name of the module and build and use a dynamically loaded object for Tcl with:

```
swig -tcl -module tcllammps lammps.i
gcc -fPIC -shared $(pkg-config tcl --cflags) -o tcllammps.so \
    lammps_wrap.c -L ../src/ -llammps
tclsh
```

Or one can build an extended Tcl shell command with the wrapped functions included with:

```
swig -tcl -module tcllmps lammps_shell.i
gcc -o tcllmpsh lammps_wrap.c -Xlinker -export-dynamic \
    -DHAVE_CONFIG_H $(pkg-config tcl --cflags) \
    $(pkg-config tcl --libs) -L ../src -llammps
```

In both cases it is assumed that the LAMMPS library was compiled as a shared library in the src folder. Otherwise the last part of the commands needs to be adjusted.

Utility functions

Definitions for several utility functions required to manage and access data passed or returned as pointers are included in the lammps.i file. So most of the functionality of the library interface should be accessible. What works and what does not depends a bit on the individual language for which the wrappers are built and how well SWIG supports those. The [SWIG documentation](#) has very detailed instructions and recommendations.

Usage examples

The tools/swig folder has multiple shell scripts, run_<name>_example.sh that will create a small example script and demonstrate how to load the wrapper and run LAMMPS through it in the corresponding programming language.

For illustration purposes below is a part of the Tcl example script.

```
load ./tcllammps.so
set lmp [lammps_open_no_mpi 0 NULL NULL]
lammps_command $lmp "units real"
lammps_command $lmp "lattice fcc 2.5"
lammps_command $lmp "region box block -5 5 -5 5 -5 5"
lammps_command $lmp "create_box 1 box"
lammps_command $lmp "create_atoms 1 box"

set dt [doublep_value [voidp_to_doublep [lammps_extract_global $lmp dt]]]
puts "LAMMPS version $ver"
puts [format "Number of created atoms: %g" [lammps_get_natoms $lmp]]
puts "Current size of timestep: $dt"
puts "LAMMPS version: [lammps_version $lmp]"
lammps_close $lmp
```

9.4.37 tabulate tool

Added in version 22Dec2022.

The `tabulate` folder contains Python scripts to generate and visualize tabulated potential files for LAMMPS. The bulk of the code is in the `tabulate` module in the `tabulate.py` file. Some example files demonstrating its use are included. See the README file for more information.

9.4.38 tinker tool

The `tinker` folder contains Python scripts to convert Tinker input files to LAMMPS.

See the README file for more information.

Those scripts were written by Steve Plimpton [sjplimp at gmail.com](mailto:sjplimp@gmail.com)

9.4.39 valgrind tool

The `valgrind` folder contains additional suppressions for LAMMPS when using `valgrind`'s `memcheck` tool to search for memory access violation and memory leaks. These suppressions are automatically invoked when running tests through CMake `ctest -T memcheck`. See the instructions in the README file to add these suppressions when using valgrind with LAMMPS or other programs.

9.4.40 vim tool

The files in the `tools/vim` directory are add-ons to the VIM editor that allow easier editing of LAMMPS input scripts. See the `README.txt` file for details.

These files were provided by Gerolf Ziegenhain ([gerolf at ziegenhain.com](mailto:gerolf@ziegenhain.com))

9.4.41 xmgrace tool

The files in the `tools/xmgrace` directory can be used to plot the thermodynamic data in LAMMPS log files via the `xmgrace` plotting package. There are several tools in the directory that can be used in post-processing mode. The `lammplot.cpp` file can be compiled and used to create plots from the current state of a running LAMMPS simulation.

See the README file for details.

These files were provided by Vikas Varshney ([vv0210 at gmail.com](mailto:vv0210@gmail.com))

HOWTO DISCUSSIONS

These doc pages describe how to perform various tasks with LAMMPS, both for users and developers. The [glossary](#) website page also lists MD terminology, with links to corresponding LAMMPS manual pages. The example input scripts included in the `examples` directory of the LAMMPS source code distribution and highlighted on the [Example scripts](#) page also show how to set up and run various kinds of simulations.

10.1 General howto

10.1.1 Restart a simulation

There are 3 ways to continue a long LAMMPS simulation. Multiple [run](#) commands can be used in the same input script. Each run will continue from where the previous run left off. Or binary restart files can be saved to disk using the [restart](#) command. At a later time, these binary files can be read via a [read_restart](#) command in a new script. Or they can be converted to text data files using the [-r command-line switch](#) and read by a [read_data](#) command in a new script.

Here we give examples of 2 scripts that read either a binary restart file or a converted data file and then issue a new run command to continue where the previous run left off. They illustrate what settings must be made in the new script. Details are discussed in the documentation for the [read_restart](#) and [read_data](#) commands.

Look at the *in.chain* input script provided in the *bench* directory of the LAMMPS distribution to see the original script that these 2 scripts are based on. If that script had the line

```
restart          50 tmp.restart
```

added to it, it would produce two binary restart files (`tmp.restart.50` and `tmp.restart.100`) as it ran.

This script could be used to read the first restart file and re-run the last 50 timesteps:

```
read_restart     tmp.restart.50

neighbor         0.4 bin
neigh_modify     every 1 delay 1

fix             1 all nve
fix             2 all langevin 1.0 1.0 10.0 904297

timestep        0.012

run             50
```

Note that the following commands do not need to be repeated because their settings are included in the restart file: **units**, **atom_style**, **special_bonds**, **pair_style**, **bond_style**. However, these commands do need to be used, since their settings are not in the restart file: **neighbor**, **fix**, **timestep**.

If you actually use this script to perform a restarted run, you will notice that the thermodynamic data match at step 50 (if you also put a `thermo 50` command in the original script), but do not match at step 100. This is because the `fix langevin` command uses random numbers in a way that does not allow for perfect restarts.

As an alternate approach, the restart file could be converted to a data file as follows:

```
lmp_g++ -r tmp.restart.50 tmp.restart.data
```

Then, this script could be used to re-run the last 50 steps:

```
units          lj
atom_style     bond
pair_style     lj/cut 1.12
pair_modify    shift yes
bond_style     fene
special_bonds  0.0 1.0 1.0

read_data      tmp.restart.data

neighbor       0.4 bin
neigh_modify   every 1 delay 1

fix            1 all nve
fix            2 all langevin 1.0 1.0 10.0 904297

timestep       0.012

reset_timestep 50
run            50
```

Note that nearly all the settings specified in the original `in.chain` script must be repeated, except the `pair_coeff` and `bond_coeff` commands, since the new data file lists the force field coefficients. Also, the `reset_timestep` command is used to tell LAMMPS the current timestep. This value is stored in restart files, but not in data files.

10.1.2 Visualize LAMMPS snapshots

Snapshots from LAMMPS simulations can be viewed, visualized, and analyzed in a variety of ways.

LAMMPS snapshots are created by the `dump` command, which can create files in several formats. The native LAMMPS dump format is a text file (see `dump atom` or `dump custom`) which can be visualized by [several visualization tools](#) for MD simulation trajectories. `OVITO` and `VMD` seem to be the most popular choices among them.

The `dump image` and `dump movie` styles can output internally rendered images or convert them to a movie during the MD run. It is also possible to create visualizations from LAMMPS inputs or restart file with `LAMMPS-GUI`, which uses the `dump image` command internally. If the LAMMPS input already contains a `dump image` command, the resulting images will be noted by LAMMPS-GUI and can be viewed and animated directly in the Slide Show dialog. The images can be transformed (i.e. scaled, mirrored, or rotated) and exported into a video, too. The Image Viewer dialog in LAMMPS-GUI can be used to visualize the *current* system, adjust a variety of visualization settings quasi-interactively from the GUI.

Programs included with LAMMPS as auxiliary tools can convert between LAMMPS format files and other formats so they can be read by certain programs. See the [Tools](#) page for details. These are rarely needed these days.

10.1.3 Basic workflow for loading LAMMPS trajectories in VMD

VMD can read native LAMMPS dump files (in text format not binary) and several other dump styles. The native LAMMPS format is preferred since it contains simulation box information. VMD does not support reading data files directly, but the [TopoTools plugin](#) does. This step is usually necessary, since the LAMMPS dump files do not contain information about the molecular topology and elements and that information can be obtained from the data file. There also is the [pbctools plugin](#) that can be used for “repairing” bonds that are broken because one of its atom passed through a periodic boundary. Because of using the plugins, the following commands need to be typed into the VMD console to read a trajectory. The following commands are based on the `peptide` example to which the command `dump 1 all atom 10 dump.peptide` was added. Note the use of the group “all” in contrast to the commented out dump commands that use the group “peptide”. This is to match the number of atoms in the data file. VMD does not support cases where the number of atoms change or you are trying to read in a subset of a system unless *all* files contain the same subset.

```
# load data file including its coordinates
topo readlammpsdata data.peptide full
# atom style full is the default ^^^^ and can be omitted

# try to infer missing atom properties from available information
topo guessatom lammps data

# now add one of more dump files
mol addfile dump.peptide type lammpstrj waitfor all
# we tell VMD which file type ^^^^^^^^^ if the filename does not end in .lammpstrj

# jump to the first frame with the data file coordinates
animate goto 0
# if needed use the following command to try and repair broken bonds
# pbc join fragment -now

# unwrap the entire trajectory to repair all broken bonds
# this is faster and more accurate than running `pbc join` for all frames
pbc unwrap -all
pbc wrap -all -compound fragment -orthorhombic
#      remove for triclinic box ^^^^^^^^^^^^^^^^^

# delete the coordinate frame from the data file
animate delete beg 0 end 0 top
# write out the topology information without coordinates to a PSF file
animate write psf peptide.psf top
# and the processed trajectory data to a DCD file for future use
animate write dcd peptide.dcd top waitfor all

#####
# the steps up to this line only need to be run once
#####
# set visualization defaults
display perspective orthographic
mol default style Licorice
mol default material Diffuse
display backgroundgradient on

# delete molecule and load psf and dcd file
mol delete top
```

(continues on next page)

(continued from previous page)

```
mol new peptide.psf
mol addfile peptide.dcd waitfor all
pbc box
```

To automate this process, you can also save these commands to a file, e.g. `peptide.vmd` and then load this file from the VMD “File” menu with “Load Visualization State...” or type in the command console `play peptide.vmd`.

10.1.4 Advanced graphics features in the *dump image* command

Added in version 11Feb2026.

The following paragraphs discuss some of the more advanced features in the *dump image* command in LAMMPS with the help of some input file examples. For exact details of keywords and arguments, please refer to the detailed documentation of the respective commands.

Please note that many of these features were added or significantly updated after LAMMPS version 10 Dec 2025 and well into the 2026 stable version development cycle. If you are using an older version of LAMMPS, these examples may likely cause errors or look differently.

Available topics

- *Complete example inputs*
- *Image quality and resolution*
- *Color selection and color management*
- *Transparency*
- *Creating and viewing animated GIFs and movie files*
- *Prototyping dump image visualizations with LAMMPS-GUI*
- *Visualizing systems using potentials with implicit bonds*
- *Visualizing body particles*
- *Visualizing ellipsoid and superellipsoid particles*
- *Visualizing regions*
- *Visualizing graphics provided by compute or fix commands*
 - *Fix graphics/objects*
 - *Fix graphics/labels*
 - *Fix graphics/arrows*
 - *Fix graphics/isosurface*
 - *Compute hbond/local*
 - *Fix reaxff/bonds*
 - *Fix smd/wall_surface*
 - *MC package fixes*

Complete example inputs

The discussions below only quote relevant sections of input files to show specifically the commands used in the visualizations. There are complete example files in the `examples/GRAPHICS` folder of the LAMMPS source code distribution.

Image quality and resolution

The image resolution is determined by the *size* keyword. The default setting is to create images with 512x512 pixels. This is rather low resolution. A typical (non-“retina”) computer screen at the time of writing this howto has about 100 dpi (= dots per inch) so that this image covers an area of a bit over 5x5 inches (or about 135x135 millimeters). Images for use in presentations, posters, or publications should generally be generated at larger sizes. When the image is meant for printing, one has to consider that a printer may have a resolution of 300 dpi or even 600 dpi which means that images should be created 3x3 or 6x6 times larger to utilize the full resolution of the printer and show as much details and be as clean as possible. Otherwise images have to be scaled up which can make them look blurry and with ragged edges.

The keywords *fsaa* and *ssao* can be used to further improve the image quality at the expense of significant additional computational cost to render the images:

- FSAA stands for **Full Scene Anti-Aliasing** and means in the case of LAMMPS that the image is rendered at four times the size (double the width and double the height) and then the pixels in the final image are computed by taking the average of 2x2 pixel groups. This will result in smoother, less ragged edges of objects in the image.
- SSAO stands for **Screen Space Ambient Occlusion** and is an image enhancement technique that uses intermediate image data (like the information of how close or far away a pixel is to the camera and its neighboring pixels) and brightens or darkens randomly selected pixels in its neighborhood based on that information. This enhances the depth perception of objects in an image.

Both methods are complementary and thus can be combined for additional improvement of the image quality. The images below show from left to right the same excerpt of a dump image output with the default settings, with *fsaa* enabled, with *ssao* enabled, and with both features enabled.

The computational cost to create the images with *dump image* depends on the image size, the number of objects to be rendered (this number can grow quickly when using fine triangle meshes), and the choice of the *fsaa* and *ssao* settings. For high resolution images, a correspondingly large image size has to be chosen.

Since the simulation has to wait for the dump image command to complete its image rendering, creating high resolution, high quality images can slow down a simulation significantly with frequent output of images. On the other hand, the image rasterizer in LAMMPS is fairly simple and thus fast compared to more advanced image generation tools like ray tracers. The method it uses to generate the images allows to have each MPI process create image data for the atoms and objects they “own” and then this image data is merged for the final output with a procedure that has $O(\log(N))$ complexity with the number of MPI processes. At the moment there is no GPU acceleration and only limited multi-threading parallelization available (e.g. for SSAO post-processing of image data).

Color selection and color management

The *dump image* command in LAMMPS has a variety of options to assign colors to the rendered graphics. In most cases the color is assigned to atom (or bond) types and uses a default map with six colors as follows:

- type 1 = red
- type 2 = forestgreen
- type 3 = blue
- type 4 = gold
- type 5 = cyan
- type 6 = magenta
- type 7 = silver
- type 8 = orange
- type 9 = lime
- type 10 = gray
- type 11 = darkred
- type 12 = darkgreen
- type 13 = darkblue
- type 14 = darkcyan
- type 15 = darkmagenta
- type 16 = darkgray

and repeats itself for types > 16. The default color sequence is thus:

This mapping can be changed by the “*dump_modify acolr*” command, though. If you want to change the color of a specific atom type, you can use *dump modify acolr*. For example to color atoms of type 1 in gray and type 2 in white, you would use:

```
dump_modify img acolr 1 gray acolr 2 white
```

There are 140 predefined colors, but you can add new colors or modify existing ones, too, with the *dump_modify color* keyword. The *color* keyword is followed by the name of the color and the intensity of the red, green, and blue components (R/G/B) in a range from 0.0 to 1.0. Here is an example to create eight new color names followed by the *acolr* keyword with a wildcard to replace the default map of six atom colors with a new map of the eight newly defined colors.

```
dump_modify viz color map1 0.012 0.016 0.322 color map2 0.008 0.243 0.541 &  
color map3 0 0.467 0.714 color map4 0 0.588 0.780 color map5 0 0.706 0.847 &  
color map6 0.282 0.792 0.894 color map7 0.565 0.878 0.937 color map8 0.792 0.941 0.  
→973 &  
acolr * map1/map2/map3/map4/map5/map6/map7/map8
```

Yet another option is to color the atoms by element. The per-element colors are predefined but LAMMPS does not know which element an atom type corresponds to and by default uses carbon for all atom types. The correct element information needs to be provided with a *dump_modify element* command followed by an element name for each atom type. In case of the peptide example bundled with LAMMPS this would be:

```
dump viz peptide image 1000 image-*.png element type size 600 600 zoom 2.0
dump_modify viz element C C O H N C C C O H H S O H
```

Finally, atoms can be colored by the value of a per-atom property using a color map. There are several variants of color maps. Here is a simple example coloring the atoms in the peptide example by their charge with a continuous color map where white is neutral, red positive, blue negative, and the color intensity corresponds to the magnitude of the charge:

```
dump viz peptide image 1000 image-*.png q type size 600 600 zoom 2.0
dump_modify viz amap -1.0 1.0 ca 0 3 min blue 0.0 white max red
```

Changed in version 4Jul2026.

Similar color selections are available for coloring bonds. The available options are: *type*, *atom*, *c_ID* (or *c_ID[I]*), and *none*. With *type* the bonds are colored by having a color assigned to each bond type which follows the same color sequence as for atoms but can be set for each bond type independent from atom types. When using the *atom* selection the bond color follows the color of the atoms. Bonds are drawn in two pieces as a cylinder from the center of the bond to each of the atoms. Thus if two atoms have different color, the bond also as two parts with different colors with this setting. If the a compute reference is used (e.g. *c_ID* or *c_ID[I]*) the bond color is taken from a colormap and the color depends on the value of the compute for the given bond. An input example for coloring bonds by the force magnitude is given below. When the bond color argument is *none*, no bonds are drawn.

```
compute bforce peptide bond/local force
dump viz peptide image 100 myimage-*.png element type bond c_bforce type
```

Transparency

It is now possible to create approximately transparent graphics objects using an [ordered dithering algorithm](#) which results in a so-called *screen-door transparency* effect. In essence, for a transparent object only a part of the pixels are drawn and thus exposing any object behind the transparent object where drawing the pixels is skipped. LAMMPS employs a 16x16 Bayer matrix pattern that leads to rather regular patterns. A benefit of this approach is that it does not add extra cost to the rendering and for a 25%, 50%, and 75% transparency setting, there are no visible pixel patterns

when also FSAA is enabled. In this case each pixel is the average of a 2x2 block of pixels in an image of double the width and height, and thus the transparent object will contribute 3, 2, or 1 pixels to the 2x2 block which is averaged.

Transparency is typically - like the color of objects - associated with an atom type and can be modified through the `dump_modify atrans` command and specified as an opacity ratio, i.e. a number between 0 (fully transparent) and 1 (fully opaque). Other choices are available and described in the documentation page.

Creating and viewing animated GIFs and movie files

A series of JPEG, PNG, or PPM images can be converted into a movie file and then played as a movie using commonly available tools. Using dump style *movie* automates this step *and* avoids the intermediate step of writing (many) image snapshot file. But LAMMPS has to be compiled with `-DLAMMPS_FFmpeg` and a compatible FFmpeg executable has to be installed. When using [LAMMPS-GUI](#) to run LAMMPS, you can run the simulation and LAMMPS-GUI will automatically show the created images in its Slideshow Viewer dialog. From there you can animate or single step through them and also export them to a movie file via FFmpeg.

To manually convert JPEG, PNG or PPM files into an animated GIF or MPEG or other movie file you can use:

1. Use the ImageMagick convert program (called `magick` in recent versions).

```
convert *.jpg foo.gif
convert -loop 1 *.ppm foo.mpg
```

Animated GIF files from ImageMagick are not optimized. You can use a program like gifsicle to optimize and thus massively shrink them. MPEG files created by ImageMagick are in MPEG-1 format with a rather inefficient compression and low quality compared to more modern compression styles like MPEG-4, H.264, VP8, VP9, H.265 and so on.

2. Use QuickTime.

Select “Open Image Sequence” under the File menu Load the images into QuickTime to animate them Select “Export” under the File menu Save the movie as a QuickTime movie (*.mov) or in another format. QuickTime can generate very high quality and efficiently compressed movie files. Some of the supported formats require to buy a license and some are not readable on all platforms until specific runtime libraries are installed.

3. Use FFmpeg

[FFmpeg](#) is a command-line tool that is available on many platforms and allows extremely flexible encoding and decoding of movies.

```
cat snap.*.jpg | ffmpeg -y -f image2pipe -c:v mjpeg -i - -b:v 2000k movie.m4v
cat snap.*.ppm | ffmpeg -y -f image2pipe -c:v ppm -i - -b:v 2400k movie.mp4
```

Front ends for FFmpeg exist for multiple platforms. For more information see the [FFmpeg homepage](#)

Play the movie:

1. Use your web browser to view an animated GIF or MP4 movie format movie.

Select “Open File” under the File menu Load the animated GIF or MP4 movie file

2. Use the freely available [VideoLAN media player \(vlc\)](#) or [FFMpeg player tool \(ffplay\)](#) to view a movie.

Both are available for multiple operating systems and support a large variety of file formats and decoders. There are plenty more media player packages available on the different operating systems.

```
vlc foo.mpg
ffplay bar.avi
```

3. Use the [Pizza.py animate tool](#), which works directly on a series of image files.

```
a = animate("foo*.jpg")
```

4. QuickTime and other Windows- or macOS-based media players can obviously play movie files directly. Similarly for corresponding tools bundled with Linux desktop environments. However, due to licensing issues with some file formats, the formats may require installing additional libraries, purchasing a license, or may not be supported.

Prototyping dump image visualizations with LAMMPS-GUI

One of the challenges when using *dump image* for creating visualizations compared to the likes of [OVITO](#) and [VMD](#) is that it is non-interactive and it can be tedious and time consuming to find suitable settings for camera view or zoom factor and others for a specific system. You would have to run LAMMPS to create an image, then view it in an image viewer program, edit the input file and repeat the process until you have found settings that you like.

This process can be streamlined with [LAMMPS-GUI](#), which does not contain its own visualization code, but rather uses *dump image* through the [LAMMPS C-language library interface](#) and displays the resulting images for its [Image Viewer Dialog](#). Through the GUI elements and dialogs many settings can be adjusted and then the image will be recreated with the updated settings and thus allowing to refine a visualization in a quasi-interactive fashion. The resulting command lines can be transferred to the cut-n-paste buffer of the windowing system and pasted into the input file and then further adjusted.

Once the input contains a *dump image* command, LAMMPS-GUI notices when a new image has been created and loads it into the “Slide Show Dialog”. This streamlines the process of building more complex visualizations once you have copied an initial draft created with the “Image Viewer Dialog” into the input since you have editor and image viewer as part of the same program and can quickly start and stop LAMMPS with a mouse click or keystroke. A large part of the visualization examples shown in this Howto page have been created this way.

Visualizing systems using potentials with implicit bonds

There are several pair styles available in LAMMPS where the bond information is not taken from the bond topology in a data file but the potentials first determine a “bond-order” parameter for pairs of atoms and - depending on the value of that parameter - apply forces for bonded interactions. This applies to *ReaxFF*, *REBO* and *AIREBO*, *BOP*, and several others pair styles. These implicit bonds will not be shown by *dump image* since its mechanism for displaying bonds relies on explicit bonds being present in the bond topology.

One can hide the fact that there are no bonds by setting the atom radii to the covalent radii of the corresponding elements (see leftmost example image below). This will result in a representation often labeled as “VDW” in popular visualization tools. Otherwise, there are currently three approaches to make those bonds visible.

1. Access the (internal) bond order information from the pair style through a custom fix and then use the *fix* keyword of the *dump image* command to use the graphics objects information provided by the fix to visualize the bonds (see below for more information). That includes bonds that are broken and formed. This is the most accurate option since it uses the data that is used by the computation of the model. This is currently only available for ReaxFF by using *fix reaxff/bonds*.
2. Use the *autobond* keyword of *dump image* to approximate the bonds based on a simple distance heuristic. This is similar to the *Dynamic Bonds* representation in *VMD*. How accurate this option will be depends on the complexity of the system and how many different bond lengths there are. For the simple water system shown below, there are no significant differences, since there is only one type of bond (between oxygen and hydrogen). The *autobond* keyword uses on top of the distance cutoff between atoms, the heuristic that no bonds will be drawn between two hydrogen atoms and thus bogus bonds are avoided when using a larger bond cutoff (e.g. suitable for carbon-carbon bonds) which is larger than the typical hydrogen-hydrogen distance for hydrogen atoms bound to the same atom (e.g. in water, methane or hydrocarbon chains).
3. Use a combination of *fix bond/break* and *fix bond/create/angle* with *bond style zero* to dynamically create and remove bonds that do not add any forces. This also requires to tell the neighbor list code to not treat any pairs of atoms as special neighbors (otherwise the corresponding pairs of atoms could be excluded from the neighbor list and thus the forces computed by the pair style incorrect) through using the *special_bonds* command. Unlike the two other options, which were added more recently, this method also works with older versions of LAMMPS. Here is an example of the necessary commands for a carbon nanotube modeled with the AIREBO potential:

```
bond_style zero
bond_coeff 1 1.4
special_bonds lj/coul 1.0 1.0 1.0
fix break all bond/break 1000 1 2.5
fix form all bond/create/angle 1000 1 1 2.0 1 aconstrain 90.0 180
```

This “graphics hack” was originally posted as part of the LAMMPS tutorial at <https://lammptutorials.github.io/sphinx/build/html/tutorial2/breaking-a-carbon-nanotube.html>

Visualizing body particles

Body particles are objects formed from either a collection of spherical particles, polygons (in 2d), or polyhedra (in 3d) formed from triangular or quadrilateral surfaces. The regular `dump` command can only output the center of those bodies (and their orientation), which complicates the visualization with external tools. In addition, the position of the constituent particles of *nparticles* bodies or the positions of the vertices of *rounded/polygon* or *rounded/polyhedron* bodies, which can be computed with `compute body/local` and output with `dump local`.

As an alternative, the bodies can be visualized directly with `dump image` using the *body* keyword. Without the *body* keyword the body particles would be visualized like atoms as single spheres. The color and transparency settings can be changed by settings those properties for the corresponding atom types. It is also possible to represent the bodies as either wireframes (*bflag1* value 2), planar faces (*bflag1* value 1), or both (*bflag1* value 3).

Visualizing ellipsoid and superellipsoid particles

Added in version 11Feb2026.

Ellipsoidal particles are a generalization of spheres that may have three different radii to define the shape. Superellipsoids are in turn a generalization of ellipsoids. They can be modeled using pair styles like *gayberne* or *resquared*. The regular `dump custom` command can output the center of those bodies, the shape parameters and the orientation as quaternions. If one follows the required conventions and follows the documented steps, those trajectory dump files can be imported and visualized in OVITO

Changed in version 30Mar2026: Now uses curved triangles instead of flat ones; “both” option is removed; support for superellipsoids was added

As an alternative, the ellipsoid and superellipsoid particles can be visualized directly with `dump image` using the *ellipsoid* keyword. The color and transparency settings can be changed by setting those properties for the corresponding atom types. It is also possible to represent the ellipsoids via generating a triangle mesh and visualizing it as either wireframes (*eflag* value 2) or rounded triangle faces (*eflag* value 1). The use of a triangle mesh is currently required since the rasterizer built into LAMMPS does not offer suitable graphics primitives for ellipsoids or superellipsoids. The mesh is constructed by iteratively refining a triangle mesh representing an icosahedron, where each triangle is replaced by four triangles in each iteration. For a smooth representation a refinement level of 4 seems sufficient, but high resolution images may benefit from a higher level (maximum is 6, see example images below). A high refinement level can cause a significant slowdown of the rendering of the image due to the large number of triangles that need to be computed and drawn. This slowdown will be more pronounced when enabling FSAA or SSAO or both.

These images were created by adding the following *dump image* and *dump_modify* commands to the `in.ellipse.resquared` input example:

```
# change /V\ this
dump viz all image 1000 image-*.png x type ellipsoid atom 1 4 0.2 &
size 600 600 zoom 1.331 view 80 20 box yes 0.025 shiny 0.2 fsaa yes
dump_modify viz pad 6 boxcolor goldenrod backcolor black backcolor2 white &
color map1 0.459 0.055 0.075 color map2 0.000 0.227 0.427 &
amap min max cf 0.0 5 min map1 0.1 map1 0.5 white 0.9 map2 max map2
```

Added in version 30Mar2026.

The visualization of superellipsoids works exactly the same way as for ellipsoids by creating a triangle mesh of an icosahedron and refining and deforming it. The difference is merely internally the applied deformation function and the corresponding computation of the surface normals. LAMMPS will auto-detect which function to use. Some visualizations of the `in.drop_test`, the `in.bowling`, and the `in.super_table` examples from the `examples/ASPHERE/superellipsoid_gran` folder are shown below.

Visualizing regions

Since there are several commands that operate on atoms within a specific *region*, it can be helpful to visualize the extent of those regions, either for debugging the command settings or for visualizing the production simulation. This is even more useful when regions are (dynamically) translated or rotated or both with the *rotate* or *move* keyword of the *region* command. The *dump image region* keyword can be used to enable such visualizations. There are currently four different draw styles available:

- *filled*: a mesh of triangles is constructed for the surface of the region and then drawn in the selected color. This draw style accounts for the *open* keyword of the *region* command and only draws the faces of a region that are closed.
- *transparent*: this is the same visualization as draw style *filled*, but in addition one can set the transparency of that visualization through an opacity parameter in the range of 0.0 (invisible) to 1.0 (fully opaque).

- *frame*: uses the same mesh of triangles as the two styles above, but renders the region's surface as a wireframe mesh with a given cylinder diameter.
- *points*: generates a cloud of random points inside the simulation box and then only draws a point as a sphere with the given color and radius if it is located inside the region. This is useful to check the impact of the *side in/out* setting of a region, and complementary to the other three draw styles, which only show the region surfaces. For visualization purposes any open faces of a region are ignored, since a region with an open face matches *all* particles.

It can sometimes be convenient to draw the same region with multiple draw styles as can be seen from the example visualization images below.

Notes on the visualization of individual region styles:

- *plane*: since in theory planes extend infinitely, some form of boundary has to be established for the visualization. Therefore a mesh of triangles is constructed and transformed according to the region settings and then only those triangles are drawn, where at least one corner is inside the simulation box. For draw style *points* the *side in/out* setting determines on which side of the plane the points are drawn.
- *cone* and *cylinder*: use triangle meshes for draw styles *filled* and *transparent* since there are no equivalent primitives (the cylinder primitive only draws half of the cylinder, since it is optimized for being capped). For draw style *frame*, only the rim of the top or bottom is drawn and the side is represented by lines from the top to the bottom.
- *box* and *prism*: for draw style *frame* only the edges of the region are shown; for draw styles *filled* and *transparent*, the faces are drawn instead, but only if they are not set as “open” in the *region* command.

Below is an example input deck for visualizing *cone* and *cylinder* regions:

```
region      box block -2 2 -2 2 -2 2
create_box 0 box

variable rot equal PI*step/1000.0

region c1 cylinder x -1.0 0.0 0.5 -1.5 1.5 open 1 open 2

region c2 cadetblue points 10000 0.15 &
region c2 goldenrod transparent 0.5 &
region c3 firebrick filled &
region c4 skyblue filled
dump_modify viz pad 4 boxcolor silver backcolor darkgray
run 500

```

Visualizing graphics provided by compute or fix commands

LAMMPS can display additional graphics objects in the *dump image* output that are added by compute or fix styles. These fall in two categories: fixes that were written with the specific purpose of adding graphics to the visualization and computes or fixes that make objects or data visible that they maintain internally. Examples for the latter case are visualizing the indenter object from *fix indent* or the wall position from one of the wall fixes. The details of what kind of graphics is added and how it can be configured is described in a section titled **Dump image info** in the documentation of the individual fix commands.

Below is a table with links to the documentation of supported compute and fix styles:

<i>compute chunk/atom</i>	<i>compute hbond/local</i>	<i>fix graphics/arrows</i>	<i>fix graphics/chunk</i>
<i>fix graphics/isosurface</i>	<i>fix graphics/labels</i>	<i>fix graphics/lines</i>	<i>fix graphics/objects</i>
<i>fix graphics/periodic</i>	<i>fix graphics/replica</i>	<i>fix atom/swap</i>	<i>fix bond/break</i>
<i>fix bond/create</i>	<i>fix bond/create/angle</i>	<i>fix bond/react</i>	<i>fix mol/swap</i>
<i>fix neighbor/swap</i>	<i>fix indent</i>	<i>fix reaxff/bonds</i>	<i>fix smd/wall_surface</i>
<i>fix surface/global</i>	<i>fix wall/body/polygon</i>	<i>fix wall/body/polyhedron</i>	<i>fix wall/ees</i>
<i>fix wall/lj93</i>	<i>fix wall/lj126</i>	<i>fix wall/lj1043</i>	<i>fix wall/colloid</i>
<i>fix wall/gran</i>	<i>fix wall/harmonic</i>	<i>fix wall/harmonic/outside</i>	<i>fix wall/lepton</i>
<i>fix wall/morse</i>	<i>fix wall/reflect</i>	<i>fix wall/reflect/stochastic</i>	<i>fix wall/srd</i>
<i>fix wall/table</i>			

There is no support for *fix wall/region* and *fix wall/gran/region*, since regions can be visualized with the *region* keyword of *dump image* (see discussion above).

Below are discussions about some aspects of specific fix commands and some input examples.

Fix graphics/objects

Fix *graphics/objects* adds some graphics primitives and more complex objects like a progress bar to the visualization where properties of the object(s) are controlled by *equal-style* or *compatible variables*.

Fix graphics/labels

Fix *graphics/labels* adds graphics from pixmaps to the visualization. These can be either images or text that is rendered internally into a pixmap with a background and a frame. Those pixmaps can be scaled, moved, made transparent, and updated during the simulation and then integrated into the *dump image* output. In both cases a “transparency” color can be chosen to skip copying any pixels of that color to make parts of the pixmap transparent. The text labels can contain *variables* that will be expanded in the same way as with *fix print* so they can report values of computed properties. Label positions are provided in the frame of reference of the simulation box and thus they can obscure other objects in the visualization or be obscured by objects.

Fig. 1: Example image using graphics objects and labels that are updated during the simulation.

Fix graphics/arrows

Fix *graphics/arrows* adds per-atom or per-chunk arrows to the visualization. The arrows represent some per-atom property or per-chunk 3-vector property. For atoms, there are the pre-defined properties *force*, *velocity*, and *dipole* (requires atom style *dipole*). Everything else would have to be computed in *atom-style* or *compatible variables* and use the *variable* keyword. For per-chunk properties, one needs to use the *chunk* keyword and provide the IDs of three computes: a *chunk/atom compute* and two per-chunk computes where the first defines the position of the (middle of the) arrow and the second the direction and length of the arrow. Popular choices would create per-molecule or per-bin chunks. Below is an example input section that computes and displays both, the total dipole moment (using *fix graphics/objects*) and the per-molecule dipole moment as arrows in addition to the per-atom velocities:

```
compute molchunk all chunk/atom molecule
compute cpos all com/chunk molchunk wrap yes
compute cdip all dipole/chunk molchunk
fix vel all graphics/arrows 10 velocity 50.0 0.066 autoscale 0.25
fix vec all graphics/arrows 10 chunk molchunk cpos cdip 3 0.1

compute dip all dipole
variable scale equal 0.75
variable dip1x equal -v_scale*c_dip[1]
variable dip1y equal -v_scale*c_dip[2]
variable dip1z equal -v_scale*c_dip[3]
variable dip2x equal v_scale*c_dip[1]
variable dip2y equal v_scale*c_dip[2]
variable dip2z equal v_scale*c_dip[3]
fix dipole all graphics/objects 1 arrow 1 v_dip1x v_dip1y v_dip1z v_dip2x v_dip2y v_
→dip2z 0.3 0.2

dump viz all image 100 image-*.png element type size 600 600 zoom 1.3 view 70 20 shiny 0.

    fcolor dipole forestgreen ftrans dipole 0.75 fcolor vel cyan ftrans vel 0.5

```

Fix graphics/isosurface

Fix *graphics/isosurface* adds a triangulated surface following a given isovalue through a 3d-grid of data of some per-atom property. The data is spread out using a Gaussian distribution with a given width and can be just a value of 1 (leading to a grid representing the number density) or mass or some other computed per-atom property from a *compute*, *fix*, or atom-style *variable*. The isosurface can be represented by either a wireframe or a mesh of triangles and there are five choices for the resolution of the grid and thus the smoothness of the surface.

The commands below provide an example for how to use the *graphics/isosurface* fix to visualize the water and lipid bilayer of the “rhodo” benchmark example as isosurfaces by using a green wireframe and a transparent white triangle surface to represent those molecules.

```

group water type 4 33

```

Compute `hbond/local`

Compute `hbond/local` of the *EXTRA-COMPUTE* package provides access to the list of hydrogen bonds as they are dynamically computed by the compute style. These can be added to the *dump image output* as arrows pointing from the hydrogen bond hydrogen atom to the hydrogen bond acceptor atom by using the `compute` keyword. The compute provides a lot of flexibility in which atoms are considered for the hydrogen bonds so that the visualization can be rather simple and straightforward but also more complex to visualize only selected aspects.

For a simple bulk water system, one could just show the entire hydrogen bond network and consider that the water oxygen atoms function as both, hydrogen bond donors and hydrogen bond acceptors. Here is an example input segment that could be added to the `examples/rdf-adf/in.spce` input file:

```
group      ogroup type 1
group      hgroup type 2
compute    hb      all hbond/local 3.5 30.0 ogroup ogroup hgroup

dump      viz      all image 100 water-*.png element type size 600 600 zoom 1.331 view_
→70 20 &
                                shiny 0.2 ssao yes 348276 0.6 fsaa yes box_
→yes 0.025 &
                                bond atom 0.35 compute hb const -0.5 0.15
dump_modify viz      pad 6 boxcolor cadetblue backcolor darkgray backcolor2 silver_
→element 0 H &
                                adiam 1 0.5 adiam 2 0.4 ccolor hb yellow
```

Note how the `cflag1` parameter is used to shrink the arrows so that their tips just touch the hydrogen bond acceptor atoms.

If one wants to distinguish between donated and accepted hydrogen bonds for a subsystem, the input could become more complex and multiple computes may be needed. Below is an input that could be added to `examples/peptide/in.peptide` input file. This selects a group of atoms centered on the peptide and containing the peptide and a shell of water molecules and uses different groups for hydrogen bond donors and acceptors to determine selectively hydrogen bonds between the peptide and the surrounding water molecules in both directions.

```

# select atoms for visualization: peptide and water molecules within 3.5 angstrom
group      viz dynamic peptide within 3.5 include molecule every 100

# define groups of donor, acceptor, and hydrogen atoms for peptide and water
group      pdonor      type 5 9          # peptide donors : nitrogens and phenol
→oxygen
group      woxygen     type 13          # water oxygens are donor and acceptor
group      pacceptor   type 3 5 9 12    # peptide acceptors: oxygens, nitrogens, and
→sulfur
group      hydrogen    type 4 10 14     # hydrogens bonded to oxygens and nitrogens

# peptide-water hydrogen bonds where the peptide is the donor
compute hb1 all hbond/local 3.5 30.0 pdonor woxygen hydrogen
# peptide-water hydrogen bonds where the peptide is the acceptor
compute hb2 all hbond/local 3.7 30.0 woxygen pacceptor hydrogen

# create donor/acceptor hydrogen bond info text
fix label all graphics/labels 100 text "Hydrogen bonds donated:  $(c_hb1:%02.0f)" 207
→72 0.0 &

Fix reaxff/bonds

Fix *reaxff/bonds* of the *REAXFF* package provides access to the list of bonds as they are dynamically computed by the *ReaxFF* pair style. As discussed above, this can be used to visualize bonds for a system where there is no explicit bond topology defined.

Fix smd/wall_surface

Fix *smd/wall_surface* of the *MACHDYN* package creates a custom wall from a mesh of triangles that is read from an STL format file.

MC package fixes

Several fixes from the *MC* package have support for adding graphics to a visualization. These are typically added spheres of the atoms that were swapped or involved in a bond that was created or broken. Below is an example for input commands that use both, *fix bond/break* and *fix bond/create/angle*. Atoms involved in a created bond are highlighted in red while atoms involved in a broken bond in yellow.

```
fix break all bond/break 500 1 2.5
fix form all bond/create/angle 500 1 1 2.2 1 aconstrain 90.0 180
variable nsteps index 500

10.1.5 Run multiple simulations from one input script

This can be done in several ways. See the documentation for individual commands for more details on how these examples work.

If “multiple simulations” means to continue a previous simulation for more timesteps, then you simply use the *run* command multiple times. For example, this script

```
units lj
atom_style atomic
read_data data.lj
run 10000
run 10000
run 10000
run 10000
run 10000
```

would run 5 successive simulations of the same system for a total of 50,000 timesteps.

If you wish to run totally different simulations, one after the other, the *clear* command can be used in between them to re-initialize LAMMPS. For example, this script

```
units lj
atom_style atomic
read_data data.lj
run 10000
clear
units lj
atom_style atomic
read_data data.lj.new
run 10000
```

would run 2 independent simulations, one after the other.

For large numbers of independent simulations, you can use *variables* and the *next* and *jump* commands to loop over the same input script multiple times with different settings. For example, this script, named *in.polymer*

```
variable d index run1 run2 run3 run4 run5 run6 run7 run8
shell cd $d
read_data data.polymer
run 10000
shell cd ..
clear
```

(continues on next page)

(continued from previous page)

```
next d
jump in.polymer
```

would run 8 simulations in different directories, using a `data.polymer` file in each directory. The same concept could be used to run the same system at 8 different temperatures, using a temperature variable and storing the output in different log and dump files, for example

```
variable a loop 8
variable t index 0.8 0.85 0.9 0.95 1.0 1.05 1.1 1.15
log log.$a
read data.polymer
velocity all create $t 352839
fix 1 all nvt $t $t 100.0
dump 1 all atom 1000 dump.$a
run 100000
clear
next t
next a
jump in.polymer
```

All of the above examples work whether you are running on 1 or multiple processors, but assumed you are running LAMMPS on a single partition of processors. LAMMPS can be run on multiple partitions via the *-partition command-line switch*.

In the last 2 examples, if LAMMPS were run on 3 partitions, the same scripts could be used if the `index` and `loop` variables were replaced with *universe*-style variables, as described in the *variable* command. Also, the `next t` and `next a` commands would need to be replaced with a single `next a t` command. With these modifications, the 8 simulations of each script would run on the 3 partitions one after the other until all were finished. Initially, 3 simulations would be started simultaneously, one on each partition. When one finished, that partition would then start the fourth simulation, and so forth, until all 8 were completed.

10.1.6 Multi-replica simulations

Several commands in LAMMPS run multi-replica simulations, meaning that multiple instances (replicas) of your simulation are run simultaneously, with small amounts of data exchanged between replicas periodically.

These are the relevant commands:

- *hyper* for bond boost hyperdynamics (HD)
- *neb* for nudged elastic band calculations (NEB)
- *neb_spin* for magnetic nudged elastic band calculations
- *prd* for parallel replica dynamics (PRD)
- *tad* for temperature accelerated dynamics (TAD)
- *temper* for parallel tempering with fixed volume
- *temper/npt* for parallel tempering extended for NPT
- *temper/grem* for parallel tempering with generalized replica exchange (gREM)
- *fix pimd* for path-integral molecular dynamics (PIMD)

NEB is a method for finding transition states and barrier potential energies. HD, PRD, and TAD are methods for performing accelerated dynamics to find and perform infrequent events. Parallel tempering or replica exchange runs

different replicas at a series of temperature to facilitate rare-event sampling. PIMD runs different replicas whose individual particles in different replicas are coupled together by springs to model a system of ring-polymers which can represent the quantum nature of atom cores.

These commands can only be used if LAMMPS was built with the REPLICA package. See the [Build package](#) page for more info.

In all these cases, you must run with one or more processors per replica. The processors assigned to each replica are determined at run-time by using the *-partition command-line switch* to launch LAMMPS on multiple partitions, which in this context are the same as replicas. E.g. these commands:

```
mpirun -np 16 lmp_linux -partition 8x2 -in in.temper
mpirun -np 8 lmp_linux -partition 8x1 -in in.neb
```

would each run 8 replicas, on either 16 or 8 processors. Note the use of the *-in command-line switch* to specify the input script which is required when running in multi-replica mode.

Also note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors. Thus, the above commands could be run on a single-processor (or few-processor) desktop so that you can run a multi-replica simulation on more replicas than you have physical processors. This is useful for testing and debugging, since with most modern processors and MPI libraries, the efficiency of a calculation can severely diminish when oversubscribing processors.

10.1.7 Library interface to LAMMPS

As described on the [Build basics](#) doc page, LAMMPS can be built as a static or shared library, so that it can be called by another code, used in a *coupled manner* with other codes, or driven through a *Python interface*.

At the core of LAMMPS is the LAMMPS class, which encapsulates the state of the simulation program through the state of the various class instances that it is composed of. So a calculation using LAMMPS requires creating an instance of the LAMMPS class and then send it (text) commands, either individually or from a file, or perform other operations that modify the state stored inside that instance or drive simulations. This is essentially what the `src/main.cpp` file does as well for the standalone LAMMPS executable, reading commands either from an input file or the standard input.

Creating a LAMMPS instance can be done by using C++ code directly or through a C-style interface library to LAMMPS that is provided in the files `src/library.cpp` and `src/library.h`. This *C language API*, can be used from C and C++, and is also the basis for the *Python* and *Fortran* interfaces or the *SWIG based wrappers* included in the LAMMPS source code.

The `examples/COUPLE` and `python/examples` directories contain some example programs written in C++, C, Fortran, and Python, which show how a driver code can link to LAMMPS as a library, run LAMMPS on a subset of processors (so the others are available to run some other code concurrently), grab data from LAMMPS, change it, and send it back into LAMMPS.

A detailed documentation of the available APIs and examples of how to use them can be found in the *Programmer Guide* section of this manual.

10.1.8 Coupling LAMMPS to other codes

LAMMPS is designed to support being coupled to other codes. For example, a quantum mechanics code might compute forces on a subset of atoms and pass those forces to LAMMPS. Or a continuum finite element (FE) simulation might use atom positions as boundary conditions on FE nodal points, compute a FE solution, and return interpolated forces on MD atoms.

LAMMPS can be coupled to other codes in at least 4 different ways. Each has advantages and disadvantages, which you will have to think about in the context of your application.

1. Define a new *fix* or *compute* command that calls the other code. In this scenario, LAMMPS is the driver code. During timestepping, the fix or compute is invoked, and can make library calls to the other code, which has been

linked to LAMMPS as a library. This is the way the [VORONOI](#) package, which computes Voronoi tessellations using the [Voro++ library](#), is interfaced to LAMMPS. See the [compute voronoi](#) command for more details. Also see the [Modify](#) pages for information on how to add a new fix or compute to LAMMPS.

2. Define a new LAMMPS command that calls the other code. This is conceptually similar to method (1), but in this case LAMMPS and the other code are on a more equal footing. Note that now the other code is not called during the timestepping of a LAMMPS run, but between runs. The LAMMPS input script can be used to alternate LAMMPS runs with calls to the other code, invoked via the new command. The [run](#) command facilitates this with its *every* option, which makes it easy to run a few steps, invoke the command, run a few steps, invoke the command, etc.

In this scenario, the other code can be called as a library, as in 1., or it could be a stand-alone code, invoked by a `system()` call made by the command (assuming your parallel machine allows one or more processors to start up another program). In the latter case the stand-alone code could communicate with LAMMPS through files that the command writes and reads.

See the [Modify command](#) page for information on how to add a new command to LAMMPS.

3. Use LAMMPS as a library called by another code. In this case, the other code is the driver and calls LAMMPS as needed. Alternately, a wrapper code could link and call both LAMMPS and another code as libraries. Again, the [run](#) command has options that allow it to be invoked with minimal overhead (no setup or clean-up) if you wish to do multiple short runs, driven by another program. Details about using the library interface are given in the [library API](#) documentation.
4. Couple LAMMPS with another code in a client/server fashion, using the [MDI Library](#) developed by the [Molecular Sciences Software Institute \(MolSSI\)](#) to run LAMMPS as either an MDI driver (client) or an MDI engine (server). The MDI driver issues commands to the MDI server to exchange data between them. See the [Using LAMMPS with the MDI library for code coupling](#) page for more information about how LAMMPS can operate in either of these modes.

10.1.9 Using LAMMPS with the MDI library for code coupling

Client/server coupling of two (or more) codes is where one code is the “client” and sends request messages (data) to one (or more) “server” code(s). A server responds to each request with a reply message (data). This enables two (or more) codes to work in tandem to perform a simulation. In this context, LAMMPS can act as either a client or server code. It does this by using the [MolSSI Driver Interface \(MDI\) library](#), developed by the [Molecular Sciences Software Institute \(MolSSI\)](#), which is supported by the [MDI](#) package.

Alternate methods for coupling codes with LAMMPS are described on the [Coupling LAMMPS to other codes](#) page.

Some advantages of client/server coupling are that the codes can run as stand-alone executables; they need not be linked together. Thus, neither code needs to have a library interface. This also makes it easy to run the two codes on different numbers of processors. If a message protocol (format and content) is defined for a particular kind of simulation, then in principle any code which implements the client-side protocol can be used in tandem with any code which implements the server-side protocol. Neither code needs to know what specific other code it is working with.

In MDI nomenclature, a client code is the “driver”, and a server code is an “engine”. One driver code can communicate with one or more instances of one or more engine codes. Driver and engine codes can be written in any language: C, C++, Fortran, Python, etc.

In addition to allowing driver and engine(s) to run as stand-alone executables, MDI also enables an engine to be a *plugin* to the client code. In this scenario, server code(s) are compiled as shared libraries, and one (or more) instances of the server are instantiated by the driver code. If the driver code runs in parallel, it can split its MPI communicator into multiple sub-communicators, and launch each plugin engine instance on a sub-communicator. Driver processors within that sub-communicator exchange messages with the corresponding engine instance, and can also send MPI messages to other processors in the driver. The driver code can also destroy engine instances and re-instantiate them. LAMMPS can operate as either a stand-alone or plugin MDI engine. When it operates as a driver, it can use either stand-alone or plugin MDI engines.

The way in which an MDI driver communicates with an MDI engine is by making `MDI_Send()` and `MDI_Recv()` calls, which are conceptually similar to `MPI_Send()` and `MPI_Recv()` calls. Each send or receive operation uses a string to identify the command name, and optionally some data, which can be a single value or vector of values of any data type. Inside the MDI library, data is exchanged between the driver and engine via MPI calls or sockets. This is a run-time choice by the user.

The *MDI* package provides a *mdi engine* command, which enables LAMMPS to operate as an MDI engine. Its doc page explains the variety of standard and custom MDI commands which the LAMMPS engine recognizes and can respond to.

The package also provides a *mdi plugin* command, which enables LAMMPS to operate as an MDI driver and load an MDI engine as a plugin library.

The package furthermore includes a *fix mdi/qm* command, in which LAMMPS operates as an MDI driver in conjunction with a quantum mechanics code as an MDI engine. The `post_force()` method of the `fix_mdi_qm.cpp` file shows how a driver issues MDI commands to another code. This command can be used to couple to an MDI engine, which is either a stand-alone code or a plugin library.

As explained in the *fix mdi/qm* command documentation, it can be used to perform *ab initio* MD simulations or energy minimizations, or to evaluate the quantum energy and forces for a series of independent systems. The `examples/mdi` directory has example input scripts for all of these use cases.

The package also has a *fix mdi/qmmm* command in which LAMMPS operates as an MDI driver in conjunction with a quantum mechanics code as an MDI engine to perform QM/MM simulations. The LAMMPS input script partitions the system into QM and MM (molecular mechanics) atoms. As described below the `examples/QUANTUM` directory has examples for coupling to 3 different quantum codes in this manner.

The `examples/mdi` directory contains Python scripts and LAMMPS input script which use LAMMPS as either an MDI driver or engine, or both. Currently, 5 example use cases are provided:

- Run *ab initio* MD (AIMD) using 2 instances of LAMMPS. As a driver, LAMMPS performs the timestepping in either NVE or NPT mode. As an engine, LAMMPS computes forces and is a surrogate for a quantum code.
- LAMMPS runs an MD simulation as a driver. Every N steps it passes the current snapshot to an MDI engine to evaluate the energy, virial, and peratom forces. As the engine, LAMMPS is a surrogate for a quantum code.
- LAMMPS loops over a series of data files and passes the configuration to an MDI engine to evaluate the energy, virial, and peratom forces and thus acts as a simulation driver. As the engine, LAMMPS is used as a surrogate for a quantum code.
- A Python script driver invokes a sequence of unrelated LAMMPS calculations. Calculations can be single-point energy/force evaluations, MD runs, or energy minimizations.
- Run AIMD with a Python driver code and 2 LAMMPS instances as engines. The first LAMMPS instance performs MD timestepping. The second LAMMPS instance acts as a surrogate QM code to compute forces.

Note

In any of these examples where LAMMPS is used as an engine, an actual QM code (provided it has support for MDI) could be used in its place, without modifying the input scripts or launch commands, except to specify the name of the QM code.

The `examples/mdi/Run.sh` file illustrates how to launch both driver and engine codes so that they communicate using the MDI library via either MPI or sockets, or using the engine as a stand-alone code, or as a plugin library.

As of March 2023, these are quantum codes with MDI support provided via Python wrapper scripts included in the LAMMPS distribution. These can be used with the `fix mdi/qm` and `fix mdi/qmmm` commands to perform QM calculations of an entire system (e.g. AIMD) or QM/MM simulations. See the `examples/QUANTUM` sub-directories for more details:

- LATTE - AIMD only
- PySCF - QM/MM only
- NWChem - AIMD or QM/MM

There are also at least two quantum codes which have direct MDI support, [Quantum ESPRESSO \(QE\)](#) and [INQ](#). There are also several QM codes which have indirect support through QCEngine or i-PI. The former means they require a wrapper program (QCEngine) with MDI support which writes/read files to pass data to the quantum code itself. The list of QCEngine-supported and i-PI-supported quantum codes is on the [MDI webpage](#).

These direct- and indirect-support codes should be usable for full system calculations (e.g. AIMD). Whether they support QM/MM models depends on the individual QM code.

10.2 Settings howto

10.2.1 2d simulations

You must use the `dimension` command to specify a 2d simulation. The default is 3d.

A 2d simulation box must be periodic in z as set by the `boundary` command. This is the default.

Simulation boxes in LAMMPS can be either orthogonal or triclinic in shape. Orthogonal boxes in 2d are a rectangle with 4 edges that are each perpendicular to either the x or y coordinate axes. Triclinic boxes in 2d are a parallelogram with opposite pairs of faces parallel to each other. LAMMPS supports two forms of triclinic boxes, restricted and general, which for 2d differ in how the box is oriented with respect to the xy coordinate axes. See the [Howto triclinic](#) for a detailed description of all 3 kinds of simulation boxes.

Here are examples of using the `create_box` command to define the simulation box for a 2d system.

```
# 2d orthogonal box using a block-style region
region mybox block -10 10 0 10 -0.5 0.5
create_box 1 mybox

# 2d restricted triclinic box using a prism-style region with only xy tilt
region mybox prism 0 10 0 10 -0.5 0.5 2.0 0.0 0.0
create_box 1 mybox

# 2d general triclinic box using a primitive cell for a 2d hex lattice
lattice custom 1.0 a1 1.0 0.0 0.0 a2 0.5 0.86602540378 0.0 &
a3 0.0 0.0 1.0 basis 0.0 0.0 0.0 triclinic/general
create_box 1 NULL 0 5 0 5 -0.5 0.5
```

Note that for 2d orthogonal or restricted triclinic boxes, the box has a 3rd dimension which must straddle $z = 0.0$ in the z dimension. Typically the width of box in the z dimension should be narrow, e.g. -0.5 to 0.5, but that is not required. For a 2d general triclinic box, the a_3 vector defined by the `lattice` command must be (0.0,0.0,1.0), which is its default value. Also the `clo` and `chi` arguments of the `create_box` command must be -0.5 and 0.5.

Here are examples of using the `read_data` command to define the simulation box for a 2d system via keywords in the header section of the data file. These are the same boxes as the examples for the `create_box` command

```
# 2d orthogonal box
-10 10 xlo xhi
```

(continues on next page)

(continued from previous page)

```

0 10      ylo yhi
-0.5 0.5 zlo zhi      # this is the default, so no need to specify

# 2d restricted triclinic box with only xy tilt
-10 10      xlo xhi
0 10      ylo yhi
-0.5 0.5 zlo zhi      # this is the default, so no need to specify
2.0 0.0 0.0 xy xz yz

# 3d general triclinic box using a primitive cell for a 2d hex lattice
5 0 0      aivec
2.5 4.3301270189 0 bvec
0 0 1      cvec      # this is the default, so no need to specify
0 0 -0.5   abc origin # this is the default for 2d, so no need to specify

```

Note that for 2d orthogonal or restricted triclinic boxes, the box has a 3rd dimension specified by the *zlo zhi* values, which must straddle $z = 0.0$. Typically the width of box in the z dimension should be narrow, e.g. -0.5 to 0.5 , but that is not required. For a 2d general triclinic box, the z component of *avec* and *bvec* must be zero, and *cvec* must be $(0,0,1)$, which is the default. The z component of *abc origin* must also be -0.5 , which is the default.

If using the *create_atoms* command to create atoms in the 2d simulation box, all the z coordinates of created atoms will be zero.

If using the *read_data* command to read in a data file of atom coordinates for a 2d system, the z coordinates of all atoms should be zero. A value within epsilon of zero is also allowed in case the data file was generated by another program with finite numeric precision, in which case the z coord for the atom will be set to zero.

Use the *fix enforce2d* command as the last fix defined in the input script. It ensures that the z -components of velocities and forces are zeroed out every timestep. The reason to make it the last fix is so that any forces added by other fixes will also be zeroed out.

Many of the example input scripts included in the examples directory are for 2d models.

Note

Some models in LAMMPS treat particles as finite-size spheres, as opposed to point particles. See the *atom_style sphere* and *fix nve/sphere* commands for details. By default, for 2d simulations, such particles will still be modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be that of a sphere. If you wish to model them as 2d discs, see the *set density/disc* command and the *disc* option for the *fix nve/sphere*, *fix nvt/sphere*, *fix nph/sphere*, *fix npt/sphere* commands.

10.2.2 Type labels

Added in version 15Sep2022.

Each atom in LAMMPS has an associated numeric atom type. Similarly, each bond, angle, dihedral, and improper is assigned a bond type, angle type, and so on. The primary use of these types is to map potential (force field) parameters to the interactions of the atom, bond, angle, dihedral, and improper.

By default, type values are entered as integers from 1 to *Ntypes* wherever they appear in LAMMPS input or output files. The total number *Ntypes* for each interaction is “locked in” when the simulation box is created.

A recent addition to LAMMPS is the option to use strings - referred to as type labels - as an alternative. Using type labels instead of numeric types can be advantageous in various scenarios. For example, type labels can make inputs more readable and generic (i.e. usable through the *include command* for different systems with different numerical values

assigned to types. This generality also applies to other inputs like data files read by `read_data` or molecule template files read by the `molecule` command. A discussion of the current type label support can be found in (*Gissinger*). See below for a list of other commands that can use type labels in different ways.

LAMMPS will *internally* continue to use numeric types, which means that many previous restrictions still apply. For example, the total number of types is locked in when creating the simulation box, and potential parameters for each type must be provided even if not used by any interactions.

A collection of type labels for all type-kinds (atom types, bond types, etc.) is stored as a “label map” which is simply a list of numeric types and their associated type labels. Within a type-kind, each type label must be unique. It can be assigned to only one numeric type. To read and write type labels to data files for a given type-kind, *all* associated numeric types need have a type label assigned. Partial maps can be saved with the `labelmap write` command and read back with the `include` command.

Valid type labels can contain most ASCII characters, but cannot start with a number, a ‘#’, or a ‘*’. Also, labels must not contain whitespace characters. When using the `labelmap command` in the LAMMPS input, if certain characters appear in the type label, such as the single (‘) or double (‘’) quote or the ‘#’ character, the label must be put in either double, single, or triple (‘‘‘’) quotes. Triple quotes allow for the most generic type label strings, but they require to have a leading and trailing blank space. When defining type labels the blanks will be ignored. Example:

```
labelmap angle 1 "" "C1'-C2"-C3# ""
```

This command will map the string ‘C1’-C2”-C3#’ to the angle type 1.

There are two ways to define label maps. One is via the `labelmap` command. The other is via the `read_data` command. A data file can have sections such as *Atom Type Labels*, *Bond Type Labels*, etc., which assign type labels to numeric types. The label map can be written out to data files by the `write_data` command. This map is also written to and read from restart files, by the `write_restart` and `read_restart` commands.

Use of type labels in LAMMPS input or output

Many LAMMPS input script commands that take a numeric type as an argument can use the associated type label instead. If a type label is not defined for a particular numeric type, only its numeric type can be used.

This example assigns labels to the atom types, and then uses the type labels to redefine the pair coefficients.

```
pair_coeff 1 2 1.0 1.0      # numeric types
labelmap atom 1 C 2 H
pair_coeff C H 1.0 1.0     # type labels
```

Adding support for type labels to various commands is an ongoing project. If an input script command (or a section in a file read by a command) allows substituting a type label for a numeric type argument, it will be explicitly mentioned in that command’s documentation page.

As a temporary measure, input script commands can take advantage of variables and how they can be expanded during processing of the input. The variables can use functions that will translate type label strings to their respective number as defined in the current label map. See the `variable` command for details.

For example, here is how the `pair_coeff` command could be used with type labels if it did not yet support them, either with an explicit variable command or an implicit variable used in the `pair_coeff` command.

```
labelmap atom 1 C 2 H
variable atom1 equal label2type(atom,C)
variable atom2 equal label2type(atom,H)
pair_coeff ${atom1} ${atom2} 1.0 1.0
```

```
labelmap atom 1 C 2 H
pair_coeff $(label2type(atom,C)) $(label2type(atom,H)) 80.0 1.2
```

Commands that can use label types

Any workflow that involves reading multiple data files, molecule templates or a combination of the two can be streamlined by using type labels instead of numeric types, because types are automatically synced between the files. The creation of simulation-ready reaction templates for *fix bond/react* is much simpler when using type labels, and results in templates that can be used without modification in multiple simulations or different systems.

10.2.3 Triclinic (non-orthogonal) simulation boxes

By default, LAMMPS uses an orthogonal simulation box to encompass the particles. The orthogonal box has its “origin” at (xlo,ylo,zlo) and extends to (xhi,yhi,zhi). Conceptually it is defined by 3 edge vectors starting from the origin given by $\mathbf{A} = (xhi-xlo,0,0)$; $\mathbf{B} = (0,yhi-ylo,0)$; $\mathbf{C} = (0,0,zhi-zlo)$. The *boundary* command sets the boundary conditions for the 6 faces of the box (periodic, non-periodic, etc). The 6 parameters (xlo,xhi,ylo,yhi,zlo,zhi) are defined at the time the simulation box is created by one of these commands:

- *create_box*
- *read_data*
- *read_restart*
- *read_dump*

Internally, LAMMPS defines box size parameters lx,ly,lz where lx = xhi-xlo, and similarly in the y and z dimensions. The 6 parameters, as well as lx,ly,lz, can be output via the *thermo_style custom* command. See the *Howto 2d* doc page for info on how zlo and zhi are defined for 2d simulations.

Triclinic simulation boxes

LAMMPS also allows simulations to be performed using triclinic (non-orthogonal) simulation boxes shaped as a 3d parallelepiped with triclinic symmetry. For 2d simulations a triclinic simulation box is effectively a parallelogram; see the *Howto 2d* doc page for details.

One use of triclinic simulation boxes is to model solid-state crystals with triclinic symmetry. The *lattice* command can be used with non-orthogonal basis vectors to define a lattice that will tile a triclinic simulation box via the *create_atoms* command.

A second use is to run Parrinello-Rahman dynamics via the *fix npt* command, which will adjust the xy, xz, yz tilt factors to compensate for off-diagonal components of the pressure tensor. The analog for an *energy minimization* is the *fix box/relax* command.

A third use is to shear a bulk solid to study the response of the material. The *fix deform* command can be used for this purpose. It allows dynamic control of the xy, xz, yz tilt factors as a simulation runs. This is discussed in the *Howto NEMD* doc page on non-equilibrium MD (NEMD) simulations.

Conceptually, a triclinic parallelepiped is defined with an “origin” at (xlo,ylo,zhi) and 3 edge vectors $\mathbf{A} = (ax,ay,az)$, $\mathbf{B} = (bx,by,bz)$, $\mathbf{C} = (cx,cy,cz)$ which can be arbitrary vectors, so long as they are non-zero, distinct, and not co-planar. In addition, they must define a right-handed system, such that $(\mathbf{A} \text{ cross } \mathbf{B})$ points in the direction of $\mathbf{C}$. Note that a

left-handed system can be converted to a right-handed system by simply swapping the order of any pair of the **A**, **B**, **C** vectors.

The 4 commands listed above for defining orthogonal simulation boxes have triclinic options which allow for specification of the origin and edge vectors **A**, **B**, **C**. For each command, this can be done in one of two ways, for what LAMMPS calls a *general* triclinic box or a *restricted* triclinic box.

A *general* triclinic box is specified by an origin (xlo, ylo, zlo) and arbitrary edge vectors **A** = (ax, ay, az), **B** = (bx, by, bz), and **C** = (cx, cy, cz). So there are 12 parameters in total.

A *restricted* triclinic box also has an origin (xlo, ylo, zlo), but its edge vectors are of the following restricted form: **A** = ($xhi-xlo, 0, 0$), **B** = ($xy, yhi-ylo, 0$), **C** = ($xz, yz, zhi-zlo$). So there are 9 parameters in total. Note that the restricted form requires **A** to be along the x-axis, **B** to be in the xy plane with a y-component in the +y direction, and **C** to have its z-component in the +z direction. Note that a restricted triclinic box is *right-handed* by construction since (**A** cross **B**) points in the direction of **C**.

The xy, xz, yz values can be zero or positive or negative. They are called “tilt factors” because they are the amount of displacement applied to edges of faces of an orthogonal box to change it into a restricted triclinic parallelepiped.

Note

Any right-handed general triclinic box (i.e. solid-state crystal basis vectors) can be rotated in 3d around its origin in order to conform to the LAMMPS definition of a restricted triclinic box. See the discussion in the next sub-section about general triclinic simulation boxes in LAMMPS.

Note that the *thermo_style custom* command has keywords for outputting the various parameters that define the size and shape of orthogonal, restricted triclinic, and general triclinic simulation boxes.

For orthogonal boxes there are 6 thermo keywords (xlo, ylo, zlo) and (xhi, yhi, zhi).

For restricted triclinic boxes there are 9 thermo keywords for (xlo, ylo, zlo), (xhi, yhi, zhi), and the (xy, xz, yz) tilt factors.

For general triclinic boxes there are 12 thermo keywords for (xlo, ylo, zlo) and the components of the **A**, **B**, **C** edge vectors, namely ($avecx, avecy, avecz$), ($bvecx, bvecy, bvecz$), and ($cvecx, cvecy, cvecz$),

The remainder of this doc page explains (a) how LAMMPS operates with general triclinic simulation boxes, (b) mathematical transformations between general and restricted triclinic boxes which may be useful when creating LAMMPS inputs or interpreting outputs for triclinic simulations, and (c) how LAMMPS uses tilt factors for restricted triclinic simulation boxes.

General triclinic simulation boxes in LAMMPS

LAMMPS allows specification of general triclinic simulation boxes with their atoms as a convenience for users who may be converting data from solid-state crystallographic representations or from DFT codes for input to LAMMPS. Likewise it allows output of dump files, data files, and thermodynamic data (e.g. pressure tensor) in a general triclinic format.

However internally, LAMMPS only uses restricted triclinic simulation boxes. This is for parallel efficiency and to formulate partitioning of the simulation box across processors, neighbor list building, and inter-processor communication of per-atom data with methods similar to those used for orthogonal boxes.

This means 4 things which are important to understand:

- Input of a general triclinic system is immediately converted to a restricted triclinic system.
- If output of per-atom data for a general triclinic system is requested (e.g. for atom coordinates in a dump file), conversion from a restricted to general triclinic system is done at the time of output.

- The conversion of the simulation box and per-atom data from general triclinic to restricted triclinic (and vice versa) is a 3d rotation operation around an origin, which is the lower left corner of the simulation box. This means an input data file for a general triclinic system should specify all per-atom quantities consistent with the general triclinic box and its orientation relative to the standard x,y,z coordinate axes. For example, atom coordinates should be inside the general triclinic simulation box defined by the edge vectors **A**, **B**, **C** and its origin. Likewise per-atom velocities should be in directions consistent with the general triclinic box orientation. E.g. a velocity vector which will be in the +x direction once LAMMPS converts from a general to restricted triclinic box, should be specified in the data file in the direction of the **A** edge vector. See the [read_data](#) doc page for info on all the per-atom vector quantities to which this rule applies when a data file for a general triclinic box is input.
- If commands such as [write_data](#) or [dump_custom](#) are used to output general triclinic information, it is effectively the inverse of the operation described in the preceding bullet.
- Other LAMMPS commands such as [region](#) or [velocity](#) or [set](#), operate on a restricted triclinic system even if a general triclinic system was defined initially.

This is the list of commands which have general triclinic options:

- [create_box](#) - define a general triclinic box
 - [create_atoms](#) - add atoms to a general triclinic box
 - [lattice](#) - define a custom lattice consistent with the **A**, **B**, **C** edge vectors of a general triclinic box
 - [read_data](#) - read a data file for a general triclinic system
 - [write_data](#) - write a data file for a general triclinic system
 - [dump_atom](#), [dump_custom](#) - output dump snapshots in general triclinic format
 - [dump_modify triclinic/general](#) - select general triclinic format for dump output
 - [thermo_style](#) - output the pressure tensor in general triclinic format
 - [thermo_modify triclinic/general](#) - select general triclinic format for thermo output
 - [read_restart](#) - read a restart file for a general triclinic system
 - [write_restart](#) - write a restart file for a general triclinic system
-

Transformation from general to restricted triclinic boxes

Let **A**,**B**,**C** be the right-handed edge vectors of a general triclinic simulation box. The equivalent LAMMPS **a**,**b**,**c** for a restricted triclinic box are a 3d rotation of **A**, **B**, and **C** and can be computed as follows:

$$\begin{aligned}
 (\mathbf{a} \quad \mathbf{b} \quad \mathbf{c}) &= \begin{pmatrix} a_x & b_x & c_x \\ 0 & b_y & c_y \\ 0 & 0 & c_z \end{pmatrix} \\
 a_x &= A \\
 b_x &= \mathbf{B} \cdot \hat{\mathbf{A}} = B \cos \gamma \\
 b_y &= |\hat{\mathbf{A}} \times \mathbf{B}| = B \sin \gamma = \sqrt{B^2 - b_x^2} \\
 c_x &= \mathbf{C} \cdot \hat{\mathbf{A}} = C \cos \beta \\
 c_y &= \mathbf{C} \cdot (\widehat{\mathbf{A} \times \mathbf{B}}) \times \hat{\mathbf{A}} = \frac{\mathbf{B} \cdot \mathbf{C} - b_x c_x}{b_y} \\
 c_z &= |\mathbf{C} \cdot (\widehat{\mathbf{A} \times \mathbf{B}})| = \sqrt{C^2 - c_x^2 - c_y^2}
 \end{aligned}$$

where $A = |\mathbf{A}|$ indicates the scalar length of $\mathbf{A}$. The hat symbol ($\hat{}$) indicates the corresponding unit vector. β and γ are angles between the $\mathbf{A}$, $\mathbf{B}$, $\mathbf{C}$ vectors as described below.

For consistency, the same rotation applied to the triclinic box edge vectors can also be applied to atom positions, velocities, and other vector quantities. This can be conveniently achieved by first converting to fractional coordinates in the general triclinic coordinates and then converting to coordinates in the restricted triclinic basis. The transformation is given by the following equation:

$$\mathbf{x} = (\mathbf{a} \quad \mathbf{b} \quad \mathbf{c}) \cdot \frac{1}{V} \begin{pmatrix} \mathbf{B} \times \mathbf{C} \\ \mathbf{C} \times \mathbf{A} \\ \mathbf{A} \times \mathbf{B} \end{pmatrix} \cdot \mathbf{X}$$

where V is the volume of the box (same in either basis), $\mathbf{X}$ is the fractional vector in the general triclinic basis and $\mathbf{x}$ is the resulting vector in the restricted triclinic basis.

Crystallographic general triclinic representation of a simulation box

General triclinic crystal structures are often defined using three lattice constants a , b , and c , and three angles α , β , and γ . Note that in this nomenclature, the a , b , and c lattice constants are the scalar lengths of the edge vectors $\mathbf{a}$, $\mathbf{b}$, and $\mathbf{c}$ defined above. The relationship between these 6 quantities (a , b , c , α , β , γ) and the LAMMPS restricted triclinic box sizes (lx, ly, lz) = ($xhi-xlo, yhi-ylo, zhi-zlo$) and tilt factors (xy, xz, yz) is as follows:

$$\begin{aligned} a &= lx \\ b^2 &= ly^2 + xy^2 \\ c^2 &= lz^2 + xz^2 + yz^2 \\ \cos \alpha &= \frac{xy * xz + ly * yz}{b * c} \\ \cos \beta &= \frac{xz}{c} \\ \cos \gamma &= \frac{xy}{b} \end{aligned}$$

The inverse relationship can be written as follows:

$$\begin{aligned} lx &= a \\ xy &= b \cos \gamma \\ xz &= c \cos \beta \\ ly^2 &= b^2 - xy^2 \\ yz &= \frac{b * c \cos \alpha - xy * xz}{ly} \\ lz^2 &= c^2 - xz^2 - yz^2 \end{aligned}$$

The values of a , b , c , α , β , and γ can be printed out or accessed by computes using the *thermo_style custom* keywords *cella*, *cellb*, *cellc*, *cellalpha*, *cellbeta*, *cellgamma*, respectively.

Output of restricted and general triclinic boxes in a dump file

As discussed on the *dump* command doc page, when the BOX BOUNDS for a snapshot is written to a dump file for a restricted triclinic box, an orthogonal bounding box which encloses the triclinic simulation box is output, along with the 3 tilt factors (xy , xz , yz) of the restricted triclinic box, formatted as follows:

```
ITEM: BOX BOUNDS xy xz yz
xlo_bound xhi_bound xy
ylo_bound yhi_bound xz
zlo_bound zhi_bound yz
```

This bounding box is convenient for many visualization programs and is calculated from the 9 restricted triclinic box parameters (xlo,xhi,ylo,yhi,zlo,zhi,xy,xz,yz) as follows:

```
xlo_bound = xlo + MIN(0.0,xy,xz,xy+xz)
xhi_bound = xhi + MAX(0.0,xy,xz,xy+xz)
ylo_bound = ylo + MIN(0.0,yz)
yhi_bound = yhi + MAX(0.0,yz)
zlo_bound = zlo
zhi_bound = zhi
```

These formulas can be inverted if you need to convert the bounding box back into the restricted triclinic box parameters, e.g. $xlo = xlo_bound - \text{MIN}(0.0,xy,xz,xy+xz)$.

Periodicity and tilt factors for triclinic simulation boxes

There is no requirement that a triclinic box be periodic in any dimension, though it typically should be in y or z if you wish to enforce a shift in coordinates due to periodic boundary conditions across the y or z boundaries. See the doc page for the [boundary](#) command for an explanation of shifted coordinates for restricted triclinic boxes which are periodic.

Some commands that work with triclinic boxes, e.g. the [fix deform](#) and [fix npt](#) commands, require periodicity or non-shrink-wrap boundary conditions in specific dimensions. See the command doc pages for details.

A restricted triclinic box can be defined with all 3 tilt factors = 0.0, so that it is initially orthogonal. This is necessary if the box will become non-orthogonal, e.g. due to use of the [fix npt](#) or [fix deform](#) commands. Alternatively, you can use the [change_box](#) command to convert a simulation box from orthogonal to restricted triclinic and vice versa.

Note

Highly tilted restricted triclinic simulation boxes can be computationally inefficient. This is due to the large volume of communication needed to acquire ghost atoms around a processor's irregular-shaped subdomain. For extreme values of tilt, LAMMPS may also lose atoms and generate an error.

LAMMPS will issue a warning if you define a restricted triclinic box with a tilt factor which skews the box more than half the distance of the parallel box length, which is the first dimension in the tilt factor (e.g. x for xz).

For example, if xlo = 2 and xhi = 12, then the x box length is 10 and the xy tilt factor should be between -5 and 5 to avoid the warning. Similarly, both xz and yz should be between $-(xhi-xlo)/2$ and $+(yhi-ylo)/2$. Note that these are not limitations, since if the maximum tilt factor is 5 (as in this example), then simulations boxes and atom configurations with tilt = ..., -15, -5, 5, 15, 25, ... are all geometrically equivalent.

If the box tilt exceeds this limit during a dynamics run (e.g. due to the [fix deform](#) command), then by default the box is “flipped” to an equivalent shape with a tilt factor within the warning bounds, and the run continues. See the [fix deform](#) page for further details. Box flips that would normally occur using the [fix deform](#) or [fix npt](#) commands can be suppressed using the [flip no](#) option with either of the commands.

One exception to box flipping is if the first dimension in the tilt factor (e.g. x for xy) is non-periodic. In that case, the limits on the tilt factor are not enforced, since flipping the box in that dimension would not change the atom positions

due to non-periodicity. In this mode, if the system tilts to large angles, the simulation will simply become inefficient, due to the highly skewed simulation box.

10.2.4 Thermostats

Thermostatting means controlling the temperature of particles in an MD simulation. *Barostatting* means controlling the pressure. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Thermostatting in LAMMPS is performed by *fixes*, or in one case by a pair style. Several thermostatting fixes are available: Nose-Hoover (nvt), Berendsen, CSVR, Langevin, and direct rescaling (temp/rescale). Dissipative particle dynamics (DPD) thermostatting can be invoked via the *dpd/tstat* pair style:

- *fix nvt*
- *fix nvt/sphere*
- *fix nvt/asphere*
- *fix nvt/sllod*
- *fix temp/berendsen*
- *fix temp/csvr*
- *fix ffl*
- *fix gif*
- *fix gld*
- *fix gle*
- *fix langevin*
- *fix temp/rescale*
- *pair_style dpd/tstat*
- *pair_style dpd/ext/tstat*

Fix nvt only thermostats the translational velocity of particles. *Fix nvt/sllod* also does this, except that it subtracts out a velocity bias due to a deforming box and integrates the SLLOD equations of motion. See the *Howto nemd* page for further details. *Fix nvt/sphere* and *fix nvt/asphere* thermostat not only translation velocities but also rotational velocities for spherical and aspherical particles.

Note

A recent (2017) book by (*Daivis and Todd*) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostatting generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

DPD thermostatting alters pairwise interactions in a manner analogous to the per-particle thermostatting of *fix langevin*.

Any of the thermostatting fixes can be instructed to use custom temperature computes that remove bias which has two effects: first, the current calculated temperature, which is compared to the requested target temperature, is calculated with the velocity bias removed; second, the thermostat adjusts only the thermal temperature component of the particle's velocities, which are the velocities with the bias removed. The removed bias is then added back to the adjusted velocities. See the doc pages for the individual fixes and for the *fix_modify* command for instructions on how to assign a temperature compute to a thermostatting fix.

For example, you can apply a thermostat only to atoms in a spatial region by using it in conjunction with *compute temp/region*. Or you can apply a thermostat to only the x and z components of velocity by using it with *compute temp/partial*. Or you could thermostat only the thermal temperature of a streaming flow of particles without affecting the streaming velocity, by using *compute temp/profile*.

Below is a list of custom temperature computes that can be used like that:

- *compute temp/asphere command*
- *compute temp/body command*
- *compute temp/chunk command*
- *compute temp/com command*
- *compute temp/deform command*
- *compute temp/partial command*
- *compute temp/profile command*
- *compute temp/ramp command*
- *compute temp/region command*
- *compute temp/rotate command*
- *compute temp/sphere command*

Note

Not all thermostat fixes perform time integration, meaning they update the velocities and positions of particles due to forces and velocities respectively. The other thermostat fixes only adjust velocities; they do NOT perform time integration updates. Thus, they should be used in conjunction with a constant NVE integration fix such as these:

- *fix nve*
- *fix nve/sphere*
- *fix nve/asphere*

Thermodynamic output, which can be setup via the *thermo_style* command, often includes temperature values. As explained on the page for the *thermo_style* command, the default temperature is setup by the thermo command itself. It is NOT the temperature associated with any thermostatting fix you have defined or with any compute you have defined that calculates a temperature. The doc pages for the thermostatting fixes explain the ID of the temperature compute they create. Thus if you want to view these temperatures, you need to specify them explicitly via the *thermo_style custom* command. Or you can use the *thermo_modify* command to re-define what temperature compute is used for default thermodynamic output.

(Daivis and Todd) Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, <https://doi.org/10.1017/9781139017848>, (2017).

10.2.5 Barostats

Barostatting means controlling the pressure in an MD simulation. *Thermostatting* means controlling the temperature of the particles. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Barostatting in LAMMPS is performed by *fixes*. Three barostatting methods are currently available: Nose-Hoover (npt and npb), Berendsen, and various linear controllers in deform/pressure:

- *fix npt*
- *fix npt/sphere*
- *fix npt/asphere*
- *fix nph*
- *fix press/berendsen*
- *fix deform/pressure*

The *fix npt* commands include a Nose-Hoover thermostat and barostat. *Fix nph* is just a Nose/Hoover barostat; it does no thermostating. The fixes *nph*, *press/berendsen*, and *deform/pressure* can be used in conjunction with any of the thermostating fixes.

As with the *thermostats*, *fix npt* and *fix nph* only use translational motion of the particles in computing T and P and performing thermo/barostatting. *Fix npt/sphere* and *fix npt/asphere* thermo/barostat using not only translation velocities but also rotational velocities for spherical and aspherical particles.

All of the barostatting fixes use the *compute pressure* compute to calculate a current pressure. By default, this compute is created with a simple *compute temp* (see the last argument of the *compute pressure* command), which is used to calculate the kinetic component of the pressure. The barostatting fixes can also use temperature computes that remove bias for the purpose of computing the kinetic component which contributes to the current pressure. See the doc pages for the individual fixes and for the *fix_modify* command for instructions on how to assign a temperature or pressure compute to a barostatting fix.

Note

As with the thermostats, the Nose/Hoover methods (*fix npt* and *fix nph*) perform time integration. *Fix press/berendsen* and *fix deform/pressure* do NOT, so they should be used with one of the constant NVE fixes or with one of the NVT fixes.

Thermodynamic output, which can be setup via the *thermo_style* command, often includes pressure values. As explained on the page for the *thermo_style* command, the default pressure is setup by the thermo command itself. It is NOT the pressure associated with any barostatting fix you have defined or with any compute you have defined that calculates a pressure. The doc pages for the barostatting fixes explain the ID of the pressure compute they create. Thus if you want to view these pressures, you need to specify them explicitly via the *thermo_style custom* command. Or you can use the *thermo_modify* command to re-define what pressure compute is used for default thermodynamic output.

10.2.6 Walls

Walls in an MD simulation are typically used to bound particle motion, i.e. to serve as a boundary condition.

Walls in LAMMPS can be of rough (made of particles) or idealized surfaces. Ideal walls can be smooth, generating forces only in the normal direction, or frictional, generating forces also in the tangential direction.

Rough walls, built of particles, can be created in various ways. The particles themselves can be generated like any other particle, via the *lattice* and *create_atoms* commands, or read in via the *read_data* command.

Their motion can be constrained by many different commands, so that they do not move at all, move together as a group at constant velocity or in response to a net force acting on them, move in a prescribed fashion (e.g. rotate around a point), etc. Note that if a time integration fix like *fix nve* or *fix nvt* is not used with the group that contains wall particles, their positions and velocities will not be updated.

- *fix aveforce* - set force on particles to average value, so they move together
- *fix setforce* - set force on particles to a value, e.g. 0.0
- *fix freeze* - freeze particles for use as granular walls

- *fix nve/noforce* - advect particles by their velocity, but without force
- *fix move* - prescribe motion of particles by a linear velocity, oscillation, rotation, variable

The *fix move* command offers the most generality, since the motion of individual particles can be specified with *variable* formula which depends on time and/or the particle position.

For rough walls, it may be useful to turn off pairwise interactions between wall particles via the *neigh_modify exclude* command.

Rough walls can also be created by specifying frozen particles that do not move and do not interact with mobile particles, and then tethering other particles to the fixed particles, via a *bond*. The bonded particles do interact with other mobile particles.

Idealized walls can be specified via several *fix* commands. *Fix wall/gran* creates frictional walls for use with granular particles; all the other commands create smooth walls.

- *fix wall/reflect* - reflective flat walls
- *fix wall/lj93* - flat walls, with Lennard-Jones 9/3 potential
- *fix wall/lj126* - flat walls, with Lennard-Jones 12/6 potential
- *fix wall/colloid* - flat walls, with *pair_style colloid* potential
- *fix wall/harmonic* - flat walls, with repulsive harmonic spring potential
- *fix wall/morse* - flat walls, with Morse potential
- *fix wall/region* - use region surface as wall
- *fix wall/gran* - flat or curved walls with *pair_style granular* potential

The *lj93*, *lj126*, *colloid*, *harmonic*, and *morse* styles all allow the flat walls to move with a constant velocity, or oscillate in time. The *fix wall/region* command offers the most generality, since the region surface is treated as a wall, and the geometry of the region can be a simple primitive volume (e.g. a sphere, or cube, or plane), or a complex volume made from the union and intersection of primitive volumes. *Regions* can also specify a volume “interior” or “exterior” to the specified primitive shape or *union* or *intersection*. *Regions* can also be “dynamic” meaning they move with constant velocity, oscillate, or rotate.

The only frictional idealized walls currently in LAMMPS are flat or curved surfaces specified by the *fix wall/gran* command. At some point we plan to allow region surfaces to be used as frictional walls, as well as triangulated surfaces.

10.2.7 NEMD simulations

Non-equilibrium molecular dynamics or NEMD simulations are typically used to measure a fluid’s rheological properties such as viscosity. In LAMMPS, such simulations can be performed by first setting up a non-orthogonal simulation box (see the preceding Howto section).

A shear strain can be applied to the simulation box at a desired strain rate by using the *fix deform* command. The *fix nvt/sllod* command can be used to thermostat the sheared fluid and integrate the SLLD equations of motion for the system. *Fix nvt/sllod* uses *compute temp/deform* to compute a thermal temperature by subtracting out the streaming velocity of the shearing atoms. The velocity profile or other properties of the fluid can be monitored via the *fix ave/chunk* command.

Note

A recent (2017) book by (*Daivis and Todd*) discusses use of the SLLD method and non-equilibrium MD (NEMD) thermostating generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

As discussed in the previous section on non-orthogonal simulation boxes, the amount of tilt or skew that can be applied is limited by LAMMPS for computational efficiency to be 1/2 of the parallel box length. However, *fix deform* can continuously strain a box by an arbitrary amount. As discussed in the *fix deform* command, when the tilt value reaches a limit, the box is flipped to the opposite limit which is an equivalent tiling of periodic space. The strain rate can then continue to change as before. In a long NEMD simulation these box re-shaping events may occur many times.

In a NEMD simulation, the “remap” option of *fix deform* should be set to “remap v”, since that is what *fix nvt/sllod* assumes to generate a velocity profile consistent with the applied shear strain rate. Alternatively, if the laboratory-frame velocity is not required (e.g. if only calculating viscosity), atom velocities can be stored in the peculiar frame using the “peculiar yes” flag of *fix nvt/sllod*, which will typically give better performance. In this case, the velocity reported by LAMMPS is the velocity relative to the flow, the “remap” option of *fix deform* should be set to “remap none”, and *fix nvt/sllod* calculates temperature using *compute temp*.

An alternative method for calculating viscosities is provided via the *fix viscosity* command.

NEMD simulations can also be used to measure transport properties of a fluid through a pore or channel. Simulations of steady-state flow can be performed using the *fix flow/gauss* command.

(Daivis and Todd) Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, <https://doi.org/10.1017/9781139017848>, (2017).

10.2.8 Long-range dispersion settings

The PPPM method computes interactions by splitting the pair potential into two parts, one of which is computed in a normal pairwise fashion, the so-called real-space part, and one of which is computed using the Fourier transform, the so called reciprocal-space or kspace part. For both parts, the potential is not computed exactly but is approximated. Thus, there is an error in both parts of the computation, the real-space and the kspace error. The just mentioned facts are true both for the PPPM for Coulomb as well as dispersion interactions. The deciding difference - and also the reason why the parameters for *pppm/disp* have to be selected with more care - is the impact of the errors on the results: The kspace error of the PPPM for Coulomb and dispersion interaction and the real-space error of the PPPM for Coulomb interaction have the character of noise. In contrast, the real-space error of the PPPM for dispersion has a clear physical interpretation: the underprediction of cohesion. As a consequence, the real-space error has a much stronger effect than the kspace error on simulation results for *pppm/disp*. Parameters must thus be chosen in a way that this error is much smaller than the kspace error.

When using *pppm/disp* and not making any specifications on the PPPM parameters via the *kspace modify* command, parameters will be tuned such that the real-space error and the kspace error are equal. This will result in simulations that are either inaccurate or slow, both of which is not desirable. For selecting parameters for the *pppm/disp* that provide fast and accurate simulations, there are two approaches, which both have their up- and downsides.

The first approach is to set desired real-space and kspace accuracies via the *kspace_modify force/disp/real* and *kspace_modify force/disp/kspace* commands. Note that the accuracies have to be specified in force units and are thus dependent on the chosen unit settings. For real units, 0.0001 and 0.002 seem to provide reasonable accurate and efficient computations for the real-space and kspace accuracies. 0.002 and 0.05 work well for most systems using lj units. PPPM parameters will be generated based on the desired accuracies. The upside of this approach is that it usually provides a good set of parameters and will work for both the *kspace_modify diff ad* and *kspace_modify diff ik* options. The downside of the method is that setting the PPPM parameters will take some time during the initialization of the simulation.

The second approach is to set the parameters for the *pppm/disp* explicitly using the *kspace_modify mesh/disp*, *kspace_modify order/disp*, and *kspace_modify gewald/disp* commands. This approach requires a more experienced user who understands well the impact of the choice of parameters on the simulation accuracy and performance. This approach provides a fast initialization of the simulation. However, it is sensitive to errors: A combination of parameters that will perform well for one system might result in far-from-optimal conditions for other simulations. For example, parameters that provide accurate and fast computations for all-atomistic force fields can provide insufficient accuracy or united-atomistic force fields (which is related to that the latter typically have larger dispersion coefficients).

To avoid inaccurate or inefficient simulations, the `pppm/disp` stops simulations with an error message if no action is taken to control the PPPM parameters. If the automatic parameter generation is desired and real-space and `k`space accuracies are desired to be equal, this error message can be suppressed using the `kspace_modify disp/auto yes` command.

A reasonable approach that combines the upsides of both methods is to make the first run using the `kspace_modify force/disp/real` and `kspace_modify force/disp/kspace` commands, write down the PPPM parameters from the output, and specify these parameters using the second approach in subsequent runs (which have the same composition, force field, and approximately the same volume).

Concerning the performance of the `pppm/disp` there are two more things to consider. The first is that when using the `pppm/disp`, the cutoff parameter does no longer affect the accuracy of the simulation (subject to that `gewald/disp` is adjusted when changing the cutoff). The performance can thus be increased by examining different values for the cutoff parameter. A lower bound for the cutoff is only set by the truncation error of the repulsive term of pair potentials.

The second is that the mixing rule of the pair style has an impact on the computation time when using the `pppm/disp`. Fastest computations are achieved when using the geometric mixing rule. Using the arithmetic mixing rule substantially increases the computational cost. The computational overhead can be reduced using the `kspace_modify mix/disp geom` and `kspace_modify splittol` commands. The first command simply enforces geometric mixing of the dispersion coefficients in `k`space computations. This introduces some error in the computations but will also significantly speed-up the simulations. The second keyword sets the accuracy with which the dispersion coefficients are approximated using a matrix factorization approach. This may result in better accuracy than using the first command, but will usually also not provide an equally good increase of efficiency.

Finally, `pppm/disp` can also be used when no mixing rules apply. This can be achieved using the `kspace_modify mix/disp none` command. Note that the code does not check automatically whether any mixing rule is fulfilled. If mixing rules do not apply, the user will have to specify this command explicitly.

10.2.9 Convert bulk system to slab

A regularly encountered simulation problem is how to convert a bulk system that has been run for a while to equilibrate into a slab system with some vacuum space and free surfaces. The challenge here is that one cannot just change the box dimensions with the [change_box command](#) or edit the box boundaries in a data file because some atoms will have non-zero image flags from diffusing around.

Changing the box dimensions results in an undesired displacement of those atoms, since the image flags indicate how many times the box length in *x*-, *y*-, or *z*-direction needs to be added or subtracted to get the “unwrapped” coordinates. By changing the box dimension this distance is changed and thus those atoms move unphysically relative to their neighbors with zero image flags. Setting image flags forcibly to zero creates problems because that could break apart molecules by having one atom of a bond on the top of the system and the other at the bottom.

i Disclaimer

The following workflow will work for many bulk systems, but not all. Some systems cannot be converted (e.g. polymers with bonds to the same molecule across periodic boundaries, sometimes called “infinite polymers”). The amount of vacuum that needs to be added depends on the length of the molecules where the system is split (the example here splits where there is water with short molecules). In some cases, the system may need to be re-centered in the box first using the [displace_atoms command](#). Also, the time spent on strong thermalization and equilibration will depend on the specific system and its thermodynamic conditions.

Below is a suggested workflow using the [Rhodopsin benchmark input](#) for demonstration. The figure shows the state *before* the procedure on the left (with unwrapped atoms that have diffused out of the box) and *after* on the right (with the vacuum added above and below). The procedure is implemented by modifying a copy of the `in.rhodo` input file. The first lines up to and including the [read_data command](#) remain unchanged. Then we insert the following lines to add vacuum to the *z* direction above and below the system:

Fig. 2: Snapshots of the bulk Rhodopsin in lipid layer and water system (right) and the generated slab geometry (left)

```
variable      delta index 10.0
reset_atoms   image all
write_dump    all custom rhodo-unwrap.lammpstrj id xu yu zu
change_box    all z final $(zlo-2.0*v_delta) $(zhi+2.0*v_delta) &
               boundary p p f
read_dump     rhodo-unwrap.lammpstrj 0 x y z box no replace yes
kspace_modify slab auto
```

Specifically, the *variable delta* (set to 10.0) represents a distance that determines the amount of vacuum added: we add twice its value in each direction to the z-dimension; thus in total 40Å get added. The *reset_atoms image all* command shall reset any image flags to become either 0 or ± 1 and thus have the minimum distance from the center of the simulation box, but the correct relative distance for bonded atoms.

Using *kspace_modify slab auto* lets the solver choose the near-optimal virtual vacuum used by the reciprocal-space slab correction from the current long-range accuracy target and box geometry. A fixed value such as *slab 3.0* can still be used if a manual override is preferred.

The *write_dump command* then writes out the resulting *unwrapped* coordinates of the system. After expanding the box, coordinates that were outside the box should now be inside and the unwrapped coordinates will become “wrapped”, while atoms outside the periodic boundaries will be wrapped back into the box and their image flags in those directions restored.

The *change_box command* adds the desired distance to the low and high box boundary in z-direction and then changes the *boundary to “p p f”* which will force the image flags in z-direction to zero and create an undesired displacement for the atoms with non-zero image flags.

With the *read_dump command* we read back and replace partially incorrect coordinates with the previously saved, unwrapped coordinates. It is important to ignore the box dimensions stored in the dump file. We want to preserve the expanded box. Finally, we turn on the slab correction for the PPPM long-range solver with the *kspace_modify command* as required when using a long range Coulomb solver for non-periodic z-dimension.

Next we replace the *fix npt command* with:

```
fix                2 nvt temp 300.0 300.0 10.0
```

We now have an open system and thus the adjustment of the cell in z-direction is no longer required. Since splitting the bulk water region where the vacuum is inserted, creates surface atoms with high potential energy, we reduce the thermostat time constant from 100.0 to 10.0 to remove excess kinetic energy resulting from that change faster.

Also the high potential energy of the surface atoms can cause that some of them are ejected from the slab. In order to suppress that, we add soft harmonic walls to push back any atoms that want to leave the slab. To determine the position of the wall, we first need to determine the extent of the atoms in z-direction and then place the harmonic walls based on that information:

```
compute            zmin all reduce min z
compute            zmax all reduce max z
thermo_style        custom zlo c_zmin zhi c_zmax
run                0 post no
fix                3 all wall/harmonic zhi $(c_zmax+v_delta) 10.0 0.0 ${delta} &
                  zlo $(c_zmin-v_delta) 10.0 0.0 ${delta}
```

The two *compute reduce* command determine the minimum and maximum z-coordinate across all atoms. In order to trigger the execution of the compute commands we need to “consume” them. This is done with the *thermo_style custom* command followed by the *run 0* command. This avoids an error accessing the min/max values determined by the compute commands to compute the location of the wall in lower and upper direction. This uses the previously defined *delta* variable to determine the distance of the wall from the extent of the system and the cutoff for the wall interaction. This way only atoms that move beyond the min/max values in z-direction will experience a restoring force, nudging them back to the slab. The force constant of $10.0 \frac{\text{kcal/mol}}{\text{\AA}}$ was determined empirically.

Adding these “restoring” soft walls assists in making the free surfaces above and below the slab flat, instead of having rugged or undulated surfaces. The impact of the walls can be changed by adjusting the force constant, cutoff, and position of the wall.

Finally, we replace the *run 100* of the original input with:

```
run                1000 post no

unfix              3
fix                2 all nvt temp 300.0 300.0 100.0
run                1000 post no

write_data          data.rhodo-slab
```

This runs the system converted to a slab first for 1000 MD steps using the walls and stronger Nose-Hoover thermostat. Then the walls are removed with *unfix 3* and the thermostat time constant reset to 100.0 and the system run for another 1000 steps. Finally the resulting slab geometry is written to a new data file *data.rhodo-slab* with a *write_data* command. The number of MD steps required to reach a proper equilibrium state is very likely larger. The number of 1000 steps (corresponding to 2 picoseconds) was chosen for demonstration purposes, so that the procedure can be easily and quickly tested.

10.2.10 Broken Bonds

Typically, molecular bond interactions persist for the duration of a simulation in LAMMPS. However, some commands break bonds dynamically, including the following:

- *bond_style quartic*
- *fix bond/break*
- *fix bond/react*

- *BPM package* bond styles

A bond can break if it is stretched beyond a user-defined threshold or more generally if other criteria are met.

For the quartic bond style, when a bond is broken its bond type is set to 0 to effectively break it and pairwise forces between the two atoms in the broken bond are “turned on”. Angles, dihedrals, etc cannot be defined for a system when *bond_style quartic* is used.

Similarly, bond styles in the BPM package are also incompatible with angles, dihedrals, etc. and when a bond breaks its type is set to zero. However, in the BPM package one can either turn off all pair interactions between bonded particles or leave them on, overlaying pair forces on top of bond forces. To remove pair forces, the special bond list is dynamically updated. More details can be found on the *Howto BPM* page.

The *fix bond/break* and *fix bond/react* commands allow breaking of bonds within a molecular topology with may also define angles, dihedrals, etc. These commands update internal topology data structures to remove broken bonds, as well as the appropriate angle, dihedral, etc interactions which include the bond. They also trigger a rebuild of the neighbor list when this occurs, to turn on the appropriate pairwise forces.

Note that when bonds are dumped to a file via the *dump local* command, bonds with type 0 are not included.

The *delete_bonds* command can be used to query the status of broken bonds with type = 0 or permanently delete them, e.g.:

```
delete_bonds all stats
delete_bonds all bond 0 remove
```

The compute *count/type* command tallies the current number of bonds (or angles, etc) for each bond (angle, etc) type. It also tallies broken bonds with type = 0.

The compute *nbond/atom* command tallies the current number of bonds each atom is part of, excluding broken bonds with type = 0.

10.3 Analysis howto

10.3.1 Output from LAMMPS (thermo, dumps, computes, fixes, variables)

There are four basic forms of LAMMPS output:

- *Thermodynamic output*, which is a list of quantities printed every few timesteps to the screen and logfile.
- *Dump files*, which contain snapshots of atoms and various per-atom values and are written at a specified frequency.
- Certain fixes can output user-specified quantities to files: *fix ave/time* for time averaging, *fix ave/chunk* for spatial or other averaging, and *fix print* for single-line output of *variables*. Fix print can also output to the screen.
- *Restart files*.

A simulation prints one set of thermodynamic output and (optionally) restart files. It can generate any number of dump files and fix output files, depending on what *dump* and *fix* commands you specify.

As discussed below, LAMMPS gives you a variety of ways to determine what quantities are calculated and printed when the thermodynamics, dump, or fix commands listed above perform output. Throughout this discussion, note that users can also *add their own computes and fixes to LAMMPS* which can generate values that can then be output with these commands.

The following subsections discuss different LAMMPS commands related to output and the kind of data they operate on and produce:

- *Global/per-atom/local/per-grid data*
- *Scalar/vector/array data*

- *Disambiguation*
- *Thermodynamic output*
- *Dump file output*
- *Fixes that write output files*
- *Computes that process output quantities*
- *Fixes that process output quantities*
- *Computes that generate values to output*
- *Fixes that generate values to output*
- *Variables that generate values to output*
- *Summary table of output options and data flow between commands*

Global/per-atom/local/per-grid data

Various output-related commands work with four different “styles” of data: global, per-atom, local, and per-grid. A global datum is one or more system-wide values, e.g. the temperature of the system. A per-atom datum is one or more values per atom, e.g. the kinetic energy of each atom. Local datums are calculated by each processor based on the atoms it owns, and there may be zero or more per atom, e.g. a list of bond distances.

A per-grid datum is one or more values per grid cell, for a grid which overlays the simulation domain. Similar to atoms and per-atom data, the grid cells and the data they store are distributed across processors; each processor owns the grid cells whose center points fall within its subdomain.

Scalar/vector/array data

Global, per-atom, local, and per-grid datums can come in three “kinds”: a single scalar value, a vector of values, or a 2d array of values. More specifically these are the valid kinds for each style:

- global scalar
- global vector
- global array
- per-atom vector
- per-atom array
- local vector
- local array
- per-grid vector
- per-grid array

A per-atom vector means a single value per atom; the “vector” is the length of the number of atoms. A per-atom array means multiple values per atom. Similarly a local vector or array means one or multiple values per entity (e.g. per bond in the system). And a per-grid vector or array means one or multiple values per grid cell.

The doc page for a compute or fix or variable that generates data will specify both the styles and kinds of data it produces, e.g. a per-atom vector. Note that a compute or fix may generate multiple styles and kinds of output. However, for per-atom data only a vector or array is output, never both. Likewise for per-local and per-grid data. An example of a fix which generates multiple styles and kinds of data is the *fix mdi/qm* command. It outputs a global scalar, global vector, and per-atom array for the quantum mechanical energy and virial of the system and forces on each atom.

By contrast, different variable styles generate only a single kind of data: a global scalar for an equal-style variable, global vector for a vector-style variable, and a per-atom vector for an atom-style variable.

When data is accessed by another command, as in many of the output commands discussed below, it can be referenced via the following bracket notation, where ID in this case is the ID of a compute. The leading “c_” would be replaced by “f_” for a fix, or “v_” for a variable (and ID would be the name of the variable):

c_ID	entire scalar, vector, or array
c_ID[I]	one element of vector, one column of array
c_ID[I][J]	one element of array

Note that using one bracket reduces the dimension of the data once (vector -> scalar, array -> vector). Using two brackets reduces the dimension twice (array -> scalar). Thus a command that uses scalar values as input can also conceptually operate on an element of a vector or array.

Per-grid vectors or arrays are accessed similarly, except that the ID for the compute or fix includes a grid name and a data name. This is because a fix or compute can create multiple grids (of different sizes) and multiple sets of data (for each grid). The fix or compute defines names for each grid and for each data set, so that all of them can be accessed by other commands. See the *Howto grid* doc page for more details.

Disambiguation

When a compute or fix produces data in multiple styles, e.g. global and per-atom, a reference to the data can sometimes be ambiguous. Usually the context in which the input script references the data determines which style is meant.

For example, if a compute outputs a global vector and a per-atom array, an element of the global vector will be accessed by using c_ID[I] in *thermodynamic output*, while a column of the per-atom array will be accessed by using c_ID[I] in a *dump custom* command.

However, if a *atom-style variable* references c_ID[I], then it could be intended to refer to a single element of the global vector or a column of the per-atom array. The doc page for any command that has a potential ambiguity (variables are the most common) will explain how to resolve the ambiguity.

In this case, an atom-style variables references per-atom data if it exists. If access to an element of a global vector is needed (as in this example), an equal-style variable which references the value can be defined and used in the atom-style variable formula instead.

Similarly, *thermodynamic output* can only reference global data from a compute or fix. But you can indirectly access per-atom data as follows. The reference c_ID[245][2] for the ID of a *compute displace/atom* command, refers to the y-component of displacement for the atom with ID 245. While you cannot use that reference directly in the *thermo_style* command, you can use it an equal-style variable formula, and then reference the variable in thermodynamic output.

Thermodynamic output

The frequency and format of thermodynamic output is set by the *thermo*, *thermo_style*, and *thermo_modify* commands. The *thermo_style* command also specifies what values are calculated and written out. Pre-defined keywords can be specified (e.g. press, etotal, etc). Three additional kinds of keywords can also be specified (c_ID, f_ID, v_name), where a *compute* or *fix* or *variable* provides the value to be output. In each case, the compute, fix, or variable must generate global values for input to the *thermo_style custom* command.

Note that thermodynamic output values can be “extensive” or “intensive”. The former scale with the number of atoms in the system (e.g. total energy), the latter do not (e.g. temperature). The setting for *thermo_modify norm* determines whether extensive quantities are normalized or not. Computes and fixes produce either extensive or intensive values; see their individual doc pages for details. *Equal-style variables* produce only intensive values; you can include a division by “natoms” in the formula if desired, to make an extensive calculation produce an intensive result.

Dump file output

Dump file output is specified by the *dump* and *dump_modify* commands. There are several pre-defined formats (*dump atom*, *dump xtc*, etc).

There is also a *dump custom* format where the user specifies what values are output with each atom. Pre-defined atom attributes can be specified (*id*, *x*, *fx*, etc). Three additional kinds of keywords can also be specified (*c_ID*, *f_ID*, *v_name*), where a *compute* or *fix* or *variable* provides the values to be output. In each case, the compute, fix, or variable must generate per-atom values for input to the *dump custom* command.

There is also a *dump local* format where the user specifies what local values to output. A pre-defined index keyword can be specified to enumerate the local values. Two additional kinds of keywords can also be specified (*c_ID*, *f_ID*), where a *compute* or *fix* or *variable* provides the values to be output. In each case, the compute or fix must generate local values for input to the *dump local* command.

There is also a *dump grid* format where the user specifies what per-grid values to output from computes or fixes that generate per-grid data.

Fixes that write output files

Several fixes take various quantities as input and can write output files: *fix ave/time*, *fix ave/chunk*, *fix ave/histo*, *fix ave/correlate*, and *fix print*.

The *fix ave/time* command enables direct output to a file and/or time-averaging of global scalars or vectors. The user specifies one or more quantities as input. These can be global *compute* values, global *fix* values, or *variables* of any style except the atom style which produces per-atom values. Since a variable can refer to keywords used by the *thermo_style custom* command (like *temp* or *press*) and individual per-atom values, a wide variety of quantities can be time averaged and/or output in this way. If the inputs are one or more scalar values, then the fix generate a global scalar or vector of output. If the inputs are one or more vector values, then the fix generates a global vector or array of output. The time-averaged output of this fix can also be used as input to other output commands.

The *fix ave/chunk* command enables direct output to a file of chunk-averaged per-atom quantities like those output in dump files. Chunks can represent spatial bins or other collections of atoms, e.g. individual molecules. The per-atom quantities can be atom density (mass or number) or atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The chunk-averaged output of this fix is global and can also be used as input to other output commands.

Note that the *fix ave/grid* command can also average the same per-atom quantities within spatial bins, but it does this for a distributed grid whose grid cells are owned by different processors. It outputs per-grid data, not global data, so it is more efficient for large numbers of averaging bins.

The *fix ave/histo* command enables direct output to a file of histogrammed quantities, which can be global or per-atom or local quantities. The histogram output of this fix can also be used as input to other output commands.

The *fix ave/correlate* command enables direct output to a file of time-correlated quantities, which can be global values. The correlation matrix output of this fix can also be used as input to other output commands.

The *fix print* command can generate a line of output written to the screen and log file or to a separate file, periodically during a running simulation. The line can contain one or more *variable* values for any style variable except the vector or atom styles). As explained above, variables themselves can contain references to global values generated by *thermodynamic* keywords, *computes*, *fixes*, or other *variables*, or to per-atom values for a specific atom. Thus the *fix print* command is a means to output a wide variety of quantities separate from normal thermodynamic or dump file output.

Computes that process output quantities

The *compute reduce* and *compute reduce/region* commands take one or more per-atom or local vector quantities as inputs and “reduce” them (sum, min, max, ave) to scalar quantities. These are produced as output values which can be used as input to other output commands.

The *compute slice* command takes one or more global vector or array quantities as inputs and extracts a subset of their values to create a new vector or array. These are produced as output values which can be used as input to other output commands.

The *compute property/atom* command takes a list of one or more pre-defined atom attributes (id, x, fx, etc) and stores the values in a per-atom vector or array. These are produced as output values which can be used as input to other output commands. The list of atom attributes is the same as for the *dump custom* command.

The *compute property/local* command takes a list of one or more pre-defined local attributes (bond info, angle info, etc) and stores the values in a local vector or array. These are produced as output values which can be used as input to other output commands.

The *compute property/grid* command takes a list of one or more pre-defined per-grid attributes (id, grid cell coords, etc) and stores the values in a per-grid vector or array. These are produced as output values which can be used as input to the *dump grid* command.

The *compute property/chunk* command takes a list of one or more pre-defined chunk attributes (id, count, coords for spatial bins) and stores the values in a global vector or array. These are produced as output values which can be used as input to other output commands.

Fixes that process output quantities

The *fix vector* command can create global vectors as output from global scalars as input, accumulating them one element at a time.

The *fix ave/atom* command performs time-averaging of per-atom vectors. The per-atom quantities can be atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The time-averaged per-atom output of this fix can be used as input to other output commands.

The *fix store/state* command can archive one or more per-atom attributes at a particular time, so that the old values can be used in a future calculation or output. The list of atom attributes is the same as for the *dump custom* command, including per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The output of this fix can be used as input to other output commands.

The *fix ave/grid* command performs time-averaging of either per-atom or per-grid data.

For per-atom data it performs averaging for the atoms within each grid cell, similar to the *fix ave/chunk* command when its chunks are defined as regular 2d or 3d bins. The per-atom quantities can be atom density (mass or number) or atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*.

The chief difference between the *fix ave/grid* and *fix ave/chunk* commands when used in this context is that the former uses a distributed grid, while the latter uses a global grid. Distributed means that each processor owns the subset of grid cells within its subdomain. Global means that each processor owns a copy of the entire grid. The *fix ave/grid* command is thus more efficient for large grids.

For per-grid data, the *fix ave/grid* command takes inputs for grid data produced by other computes or fixes and averages the values for each grid point over time.

Computes that generate values to output

Every *compute* in LAMMPS produces either global or per-atom or local or per-grid values. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The page for each compute command describes what it produces. Computes that produce per-atom or local or per-grid values have the word “atom” or “local” or “grid” as the last word in their style name. Computes without the word “atom” or “local” or “grid” produce global values.

Fixes that generate values to output

Some *fixes* in LAMMPS produces either global or per-atom or local or per-grid values which can be accessed by other commands. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The page for each fix command tells whether it produces any output quantities and describes them.

Variables that generate values to output

Variables defined in an input script can store one or more strings. But equal-style, vector-style, and atom-style or atomfile-style variables generate a global scalar value, global vector or values, or a per-atom vector, respectively, when accessed. The formulas used to define these variables can contain references to the thermodynamic keywords and to global and per-atom data generated by computes, fixes, and other variables. The values generated by variables can be used as input to and thus output by the other commands described in this section.

Per-grid variables have not (yet) been implemented.

Summary table of output options and data flow between commands

This table summarizes the various commands that can be used for generating output from LAMMPS. Each command produces output data of some kind and/or writes data to a file. Most of the commands can take data from other commands as input. Thus you can link many of these commands together in pipeline form, where data produced by one command is used as input to another command and eventually written to the screen or to a file. Note that to hook two commands together the output and input data types must match, e.g. global/per-atom/local data and scalar/vector/array data.

Also note that, as described above, when a command takes a scalar as input, that could also be an element of a vector or array. Likewise a vector input could be a column of an array.

Command	Input	Output
<i>thermo_style custom</i>	global scalars	screen, log file
<i>dump custom</i>	per-atom vectors	dump file
<i>dump local</i>	local vectors	dump file
<i>dump grid</i>	per-grid vectors	dump file
<i>fix print</i>	global scalar from variable	screen, file
<i>print</i>	global scalar from variable	screen
<i>computes</i>	N/A	global/per-atom/local/per-grid scalar/vector/array
<i>fixes</i>	N/A	global/per-atom/local/per-grid scalar/vector/array
<i>variables</i>	global scalars and vectors, per-atom vectors	global scalar and vector, per-atom vector
<i>compute reduce</i>	per-atom/local vectors	global scalar/vector
<i>compute slice</i>	global vectors/arrays	global vector/array
<i>compute property/atom</i>	N/A	per-atom vector/array
<i>compute property/local</i>	N/A	local vector/array
<i>compute property/grid</i>	N/A	per-grid vector/array
<i>compute property/chunk</i>	N/A	global vector/array
<i>fix vector</i>	global scalars	global vector
<i>fix ave/atom</i>	per-atom vectors	per-atom vector/array
<i>fix ave/time</i>	global scalars/vectors	global scalar/vector/array, file
<i>fix ave/chunk</i>	per-atom vectors	global array, file

<i>fix ave/correlate</i>	global scalars	global array, file
<i>fix store/state</i>	per-atom vectors	per-atom vector/array

10.3.2 Output structured data from LAMMPS

LAMMPS can output structured data with the *print* and *fix print* command. This gives you flexibility since you can build custom data formats that contain system properties, thermo data, and variables values. This output can be directed to the screen and/or to a file for post processing.

Writing the current system state, thermo data, variable values

Use the *print* command to output the current system state, which can include system properties, thermo data and variable values.

YAML

```
print """"---
timestep: $(step)
pe: $(pe)
ke: $(ke)
..."""" file current_state.yaml screen no
```

Listing 1: current_state.yaml

```
---
timestep: 250
pe: -4.7774327356321810711
ke: 2.4962152903997174569
```

JSON

```
print """{
  "timestep": $(step),
  "pe": $(pe),
  "ke": $(ke)
}""" file current_state.json screen no
```

Listing 2: current_state.json

```
{
  "timestep": 250,
  "pe": -4.7774327356321810711,
  "ke": 2.4962152903997174569
}
```

YAML format thermo_style or dump_style output

Extracting data from log file

Added in version 24Mar2022.

LAMMPS supports the thermo style “yaml” and for “custom” style thermodynamic output the format can be changed to YAML with *thermo_modify line yaml*. This will produce a block of output in a compact YAML format - one “document” per run - of the following style:

```
---
keywords: ['Step', 'Temp', 'E_pair', 'E_mol', 'TotEng', 'Press', ]
data:
- [100, 0.757453103239935, -5.7585054860159, 0, -4.62236133677021, 0.207261053624721, ]
- [110, 0.759322359337036, -5.7614668389562, 0, -4.62251889318624, 0.194314975399602, ]
- [120, 0.759372342462676, -5.76149365656489, 0, -4.62247073844943, 0.191600048851267, ]
→]
- [130, 0.756833027516501, -5.75777334823494, 0, -4.62255928350835, 0.208792327853067, ]
→]
...
```

This data can be extracted and parsed from a log file using python with:

```
import re, yaml
try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader
```

(continues on next page)

(continued from previous page)

```
docs = ""
with open("log.lammps") as f:
    for line in f:
        m = re.search(r"^(keywords:.*$|data:$|---$|\.\.\. $| - \[.*\]$)", line)
        if m: docs += m.group(0) + '\n'

thermo = list(yaml.load_all(docs, Loader=Loader))

print("Number of runs: ", len(thermo))
print(thermo[1]['keywords'][4], ' = ', thermo[1]['data'][2][4])
```

After loading the YAML data, *thermo* is a list containing a dictionary for each “run” where the tag “keywords” maps to the list of thermo header strings and the tag “data” has a list of lists where the outer list represents the lines of output and the inner list the values of the columns matching the header keywords for that step. The second print() command for example will print the header string for the fifth keyword of the second run and the corresponding value for the third output line of that run:

```
Number of runs: 2
TotEng = -4.62140097780047
```

Extracting data from dump file

Added in version 4May2022.

YAML format output has been added to multiple commands in LAMMPS, for example *dump yaml* or *fix ave/time*. Depending on the kind of data being written, organization of the data or the specific syntax used may change, but the principles are very similar and all files should be readable with a suitable YAML parser. A simple example for this is given below:

```
import yaml
try:
    from yaml import CSafeLoader as YamlLoader
except ImportError:
    from yaml import SafeLoader as YamlLoader

timesteps = []
with open("dump.yaml", "r") as f:
    data = yaml.load_all(f, Loader=YamlLoader)

    for d in data:
        print('Processing timestep %d' % d['timestep'])
        timesteps.append(d)

print('Read %d timesteps from yaml dump' % len(timesteps))
print('Second timestep: ', timesteps[1]['timestep'])
print('Box info: x: ', timesteps[1]['box'][0], ' y:', timesteps[1]['box'][1], ' z:',
      ↪timesteps[1]['box'][2])
print('First 5 per-atom columns: ', timesteps[1]['keywords'][0:5])
print('Corresponding 10th atom data: ', timesteps[1]['data'][9][0:5])
```

The corresponding output for a YAML dump command added to the “melt” example is:

```

Processing timestep 0
Processing timestep 50
Processing timestep 100
Processing timestep 150
Processing timestep 200
Processing timestep 250
Read 6 timesteps from yaml dump
Second timestep: 50
Box info: x: [0, 16.795961913825074] y: [0, 16.795961913825074] z: [0, 16.
→795961913825074]
First 5 per-atom columns: ['id', 'type', 'x', 'y', 'z']
Corresponding 10th atom data: [10, 1, 4.43828, 0.968481, 0.108555]

```

Processing scalar data with Python

After reading and parsing the YAML format data, it can be easily imported for further processing and visualization with the [pandas](#) and [matplotlib](#) Python modules. Because of the organization of the data in the YAML format thermo output, it needs to be told to process only the ‘data’ part of the imported data to create a pandas data frame, and one needs to set the column names from the ‘keywords’ entry. The following Python script code example demonstrates this, and creates the image shown on the right of a simple plot of various bonded energy contributions versus the timestep from a run of the ‘peptide’ example input after changing the *thermo style* to ‘yaml’. The properties to be used for x and y values can be conveniently selected through the keywords. Please note that those keywords can be changed to custom strings with the *thermo_modify colname* command.

```

import re, yaml
import pandas as pd
import matplotlib.pyplot as plt

try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

docs = ""
with open("log.lammps") as f:
    for line in f:
        m = re.search(r"^(keywords:.*$|data:$|---$|\\.\\.\\. $| - \[.*\]$)", line)
        if m: docs += m.group(0) + '\n'

thermo = list(yaml.load_all(docs, Loader=Loader))

df = pd.DataFrame(data=thermo[0]['data'], columns=thermo[0]['keywords'])
fig = df.plot(x='Step', y=['E_bond', 'E_angle', 'E_dihed', 'E_impro'], ylabel='Energy in_
→kcal/mol')
plt.savefig('thermo_bondeng.png')

```

Processing vector data with Python

Global *vector* data as produced by *fix ave/time* uses a slightly different organization of the data. You still have the dictionary keys ‘keywords’ and ‘data’ for the column headers and the data. But the data is a dictionary indexed by the time step and for each step there are multiple rows of values each with a list of the averaged properties. This requires a slightly different processing, since the entire data cannot be directly imported into a single pandas DataFrame class instance. The following Python script example demonstrates how to read such data. The result will combine the data for the different steps into one large “multi-index” table. The pandas IndexSlice class can then be used to select data from this combined data frame.

```
import yaml
import pandas as pd

try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

with open("ave.yaml") as f:
    ave = yaml.load(f, Loader=Loader)

keys = ave['keywords']
df = {}
for k in ave['data'].keys():
    df[k] = pd.DataFrame(data=ave['data'][k], columns=keys)

# create multi-index data frame
df = pd.concat(df)

# output only the first 3 value for steps 200 to 300 of the column Pressure
idx = pd.IndexSlice
print(df['Pressure'].loc[idx[200:300, 0:2]])
```

Processing scalar data with Perl

The ease of processing YAML data is not limited to Python. Here is an example for extracting and processing a LAMMPS log file with Perl instead.

```
use YAML::XS;

open(LOG, "log.lammps") or die("could not open log.lammps: $!");
my $file = "";
while(my $line = <LOG>) {
    if ($line =~ /^(keywords:.*$|data:$|---$|\.\.\.$| - \[.*\]$)/) {
        $file .= $line;
    }
}
close(LOG);

# convert YAML to perl as nested hash and array references
my $thermo = Load $file;

# convert references to real arrays
```

(continues on next page)

(continued from previous page)

```

my @keywords = @{$thermo->{'keywords'}};
my @data = @{$thermo->{'data'}};

# print first two columns
print("$keywords[0] $keywords[1]\n");
foreach (@data) {
    print("${$_}[0] ${$_}[1]\n");
}

```

Writing continuous data during a simulation

The *fix print* command allows you to output an arbitrary string at defined times during a simulation run.

YAML

```

fix extra all print 50 ""
- timestep: $(step)
  pe: $(pe)
  ke: $(ke)"" file output.yaml screen no

```

Listing 3: output.yaml

```

# Fix print output for fix extra
- timestep: 0
  pe: -6.77336805325924729
  ke: 4.4988750000000026219

- timestep: 50
  pe: -4.8082494418323200591
  ke: 2.5257981827119797558

- timestep: 100
  pe: -4.7875608875581505686
  ke: 2.5062598821985102582

- timestep: 150
  pe: -4.7471033686005483787
  ke: 2.466095925545450207

- timestep: 200
  pe: -4.7509052858544134068
  ke: 2.4701136792591693592

- timestep: 250
  pe: -4.7774327356321810711
  ke: 2.4962152903997174569

```

Post-processing of YAML files can be easily be done with Python and other scripting languages. In case of Python the *yaml* package allows you to load the data files and obtain a list of dictionaries.

```
import yaml
```

(continues on next page)

(continued from previous page)

```
with open("output.yaml") as f:
    data = yaml.load(f, Loader=yaml.FullLoader)

print(data)
```

```
[{'timestep': 0, 'pe': -6.773368053259247, 'ke': 4.4988750000000003},
 {'timestep': 50, 'pe': -4.80824944183232, 'ke': 2.5257981827119798},
 {'timestep': 100, 'pe': -4.787560887558151, 'ke': 2.5062598821985103},
 {'timestep': 150, 'pe': -4.747103368600548, 'ke': 2.46609592554545},
 {'timestep': 200, 'pe': -4.750905285854413, 'ke': 2.4701136792591694},
 {'timestep': 250, 'pe': -4.777432735632181, 'ke': 2.4962152903997175}]
```

Line Delimited JSON (LD-JSON)

The JSON format itself is very strict when it comes to delimiters. For continuous output/streaming data it is beneficial use the *line delimited JSON* format. Each line represents one JSON object.

```
fix extra all print 50 """"{"timestep": $(step), "pe": $(pe), "ke": $(ke)}"""" &
    title "" file output.json screen no
```

Listing 4: output.json

```
{"timestep": 0, "pe": -6.77336805325924729, "ke": 4.49887500000000026219}
{"timestep": 50, "pe": -4.8082494418323200591, "ke": 2.5257981827119797558}
{"timestep": 100, "pe": -4.7875608875581505686, "ke": 2.5062598821985102582}
{"timestep": 150, "pe": -4.7471033686005483787, "ke": 2.466095925545450207}
{"timestep": 200, "pe": -4.7509052858544134068, "ke": 2.4701136792591693592}
{"timestep": 250, "pe": -4.7774327356321810711, "ke": 2.4962152903997174569}
```

One simple way to load this data into a Python script is to use the *pandas* package. It can directly load these files into a data frame:

```
import pandas as pd

data = pd.read_json('output.json', lines=True)
print(data)
```

	timestep	pe	ke
0	0	-6.773368	4.498875
1	50	-4.808249	2.525798
2	100	-4.787561	2.506260
3	150	-4.747103	2.466096
4	200	-4.750905	2.470114
5	250	-4.777433	2.496215

10.3.3 Use chunks to calculate system properties

In LAMMPS, “chunks” are collections of atoms, as defined by the *compute chunk/atom* command, which assigns each atom to a chunk ID (or to no chunk at all). The number of chunks and the assignment of chunk IDs to atoms can be static or change over time. Examples of “chunks” are molecules or spatial bins or atoms with similar values (e.g. coordination number or potential energy).

The per-atom chunk IDs can be used as input to two other kinds of commands, to calculate various properties of a system:

- *fix ave/chunk*
- any of the *compute */chunk* commands

Here a brief overview for each of the 4 kinds of chunk-related commands is provided. Then some examples are given of how to compute different properties with chunk commands.

Compute chunk/atom command:

This compute can assign atoms to chunks of various styles. Only atoms in the specified group and optional specified region are assigned to a chunk. Here are some possible chunk definitions:

atoms in same molecule	chunk ID = molecule ID
atoms of same atom type	chunk ID = atom type
all atoms with same atom property (charge, radius, etc)	chunk ID = output of compute property/atom
atoms in same cluster	chunk ID = output of <i>compute cluster/atom</i> command
atoms in same spatial bin	chunk ID = bin ID
atoms in same rigid body	chunk ID = molecule ID used to define rigid bodies
atoms with similar potential energy	chunk ID = output of <i>compute pe/atom</i>
atoms with same local defect structure	chunk ID = output of <i>compute centro/atom</i> or <i>compute coord/atom</i> command

Note that chunk IDs are integer values, so for atom properties or computes that produce a floating point value, they will be truncated to an integer. You could also use the compute in a variable that scales the floating point value to spread it across multiple integers.

Spatial bins can be of various kinds, e.g. 1d bins = slabs, 2d bins = pencils, 3d bins = boxes, spherical bins, cylindrical bins.

This compute also calculates the number of chunks *Nchunk*, which is used by other commands to tally per-chunk data. *Nchunk* can be a static value or change over time (e.g. the number of clusters). The chunk ID for an individual atom can also be static (e.g. a molecule ID), or dynamic (e.g. what spatial bin an atom is in as it moves).

Note that this compute allows the per-atom output of other *computes*, *fixes*, and *variables* to be used to define chunk IDs for each atom. This means you can write your own compute or fix to output a per-atom quantity to use as chunk ID. See the *Modify* doc pages for info on how to do this. You can also define a *per-atom variable* in the input script that uses a formula to generate a chunk ID for each atom.

Fix ave/chunk command:

This fix takes the ID of a *compute chunk/atom* command as input. For each chunk, it then sums one or more specified per-atom values over the atoms in each chunk. The per-atom values can be any atom property, such as velocity, force, charge, potential energy, kinetic energy, stress, etc. Additional keywords are defined for per-chunk properties like density and temperature. More generally any per-atom value generated by other *computes*, *fixes*, and *per-atom variables*, can be summed over atoms in each chunk.

Similar to other averaging fixes, this fix allows the summed per-chunk values to be time-averaged in various ways, and output to a file. The fix produces a global array as output with one row of values per chunk.

Compute */chunk commands:

The following computes operate on chunks of atoms to produce per-chunk values. Any compute whose style name ends in “/chunk” is in this category:

- *compute com/chunk*
- *compute gyration/chunk*
- *compute inertia/chunk*
- *compute msd/chunk*
- *compute property/chunk*
- *compute temp/chunk*
- *compute torque/chunk*
- *compute vcm/chunk*

They each take the ID of a *compute chunk/atom* command as input. As their names indicate, they calculate the center-of-mass, radius of gyration, moments of inertia, mean-squared displacement, temperature, torque, and velocity of center-of-mass for each chunk of atoms. The *compute property/chunk* command can tally the count of atoms in each chunk and extract other per-chunk properties.

The reason these various calculations are not part of the *fix ave/chunk command*, is that each requires a more complicated operation than simply summing and averaging over per-atom values in each chunk. For example, many of them require calculation of a center of mass, which requires summing mass*position over the atoms and then dividing by summed mass.

All of these computes produce a global vector or global array as output, with one or more values per chunk. The output can be used in various ways:

- As input to the *fix ave/time* command, which can write the values to a file and optionally time average them.
- As input to the *fix ave/histo* command to histogram values across chunks. E.g. a histogram of cluster sizes or molecule diffusion rates.
- As input to special functions of *equal-style variables*, like `sum()` and `max()` and `ave()`. E.g. to find the largest cluster or fastest diffusing molecule or average radius-of-gyration of a set of molecules (chunks).

Other chunk commands:

- *compute chunk/spread/atom*
- *compute reduce/chunk*

The *compute chunk/spread/atom* command spreads per-chunk values to each atom in the chunk, producing per-atom values as its output. This can be useful for outputting per-chunk values to a per-atom *dump file*. Or for using an atom’s associated chunk value in an *atom-style variable*. Or as input to the *fix ave/chunk* command to spatially average per-chunk values calculated by a per-chunk compute.

The *compute reduce/chunk* command reduces a peratom value across the atoms in each chunk to produce a value per chunk. When used with the *compute chunk/spread/atom* command it can create peratom values that induce a new set of chunks with a second *compute chunk/atom* command.

Example calculations with chunks

Here are examples using chunk commands to calculate various properties:

1. Average velocity in each of 1000 2d spatial bins:

```
compute cc1 all chunk/atom bin/2d x 0.0 0.1 y lower 0.01 units reduced
fix 1 all ave/chunk 100 10 1000 cc1 vx vy file tmp.out
```

2. Temperature in each spatial bin, after subtracting a flow velocity:

```
compute cc1 all chunk/atom bin/2d x 0.0 0.1 y lower 0.1 units reduced
compute vbias all temp/profile 1 0 0 y 10
fix 1 all ave/chunk 100 10 1000 cc1 temp bias vbias file tmp.out
```

3. Center of mass of each molecule:

```
compute cc1 all chunk/atom molecule
compute myChunk all com/chunk cc1
fix 1 all ave/time 100 1 100 c_myChunk[*] file tmp.out mode vector
```

4. Total force on each molecule and ave/max across all molecules:

```
compute cc1 all chunk/atom molecule
fix 1 all ave/chunk 1000 1 1000 cc1 fx fy fz file tmp.out
variable xave equal ave(f_1[2])
variable xmax equal max(f_1[2])
thermo 1000
thermo_style custom step temp v_xave v_xmax
```

5. Histogram of cluster sizes:

```
compute cluster all cluster/atom 1.0
compute cc1 all chunk/atom c_cluster compress yes
compute size all property/chunk cc1 count
fix 1 all ave/histo 100 1 100 0 20 20 c_size mode vector ave running beyond ignore file_
→tmp.histo
```

6. An example for using a per-chunk value to apply per-atom forces to compress individual polymer chains (molecules) in a mixture, is explained on the [compute chunk/spread/atom](#) command doc page.

7. An example for using one set of per-chunk values for molecule chunks, to create a second set of micelle-scale chunks (clustered molecules, due to hydrophobicity), is explained on the [compute reduce/chunk](#) command doc page.

8. An example for using one set of per-chunk values (dipole moment vectors) for molecule chunks, spreading the values to each atom in each chunk, then defining a second set of chunks as spatial bins, and using the [fix ave/chunk](#) command to calculate an average dipole moment vector for each bin. This example is explained on the [compute chunk/spread/atom](#) command doc page.

10.3.4 Using distributed grids

Added in version 22Dec2022.

LAMMPS has internal capabilities to create uniformly spaced grids which overlay the simulation domain. For 2d and 3d simulations these are 2d and 3d grids respectively. Conceptually a grid can be thought of as a collection of grid cells. Each grid cell can store one or more values (data).

The grid cells and data they store are distributed across processors. Each processor owns the grid cells (and data) whose center points lie within the spatial subdomain of the processor. If needed for its computations, a processor may also store ghost grid cells with their data.

Distributed grids can overlay orthogonal or triclinic simulation boxes; see the [Howto triclinic](#) doc page for an explanation of the latter. For a triclinic box, the grid cell shape conforms to the shape of the simulation domain, e.g.

parallelograms instead of rectangles in 2d.

If the box size or shape changes during a simulation, the grid changes with it, so that it always overlays the entire simulation domain. For non-periodic dimensions, the grid size in that dimension matches the box size, as set by the *boundary* command for fixed or shrink-wrapped boundaries.

If load-balancing is invoked by the *balance* or *fix balance* commands, then the subdomain owned by a processor can change which may also change which grid cells they own.

Post-processing and visualization of grid cell data can be enabled by the *dump grid*, *dump grid/vtk*, and *dump image* commands. The latter has an optional *grid* keyword. The *OVITO visualization tool* also plans (as of Nov 2022) to add support for visualizing grid cell data (along with atoms) using *dump grid* output files as input.

Note

For developers, distributed grids are implemented within the code via two classes: *Grid2d* and *Grid3d*. These partition the grid across processors and have methods which allow forward and reverse communication of ghost grid data as well as load balancing. If you write a new compute or fix which needs a distributed grid, these are the classes to look at. A new pair style could use a distributed grid by having a fix define it. Please see the section on *using distributed grids within style classes* for a detailed description.

These are the commands which currently define or use distributed grids:

- *fix ttm/grid* - store electron temperature on grid
- *fix ave/grid* - time average per-atom or per-grid values
- *compute property/grid* - generate grid IDs and coords
- *dump grid* - output per-grid values in LAMMPS format
- *dump grid/vtk* - output per-grid values in VTK format
- *dump image grid* - include colored grid in output images
- *pair_style amoeba* - FFT grids
- *kpace_style ppm* (and variants) - FFT grids
- *kpace_style msm* (and variants) - MSM grids

The grids used by the *kpace_style* can not be referenced by an input script. However the grids and data created and used by the other commands can be.

A compute or fix command may create one or more grids (of different sizes). Each grid can store one or more data fields. A data field can be a single value per grid point (per-grid vector) or multiple values per grid point (per-grid array). See the *Howto output* doc page for an explanation of how per-grid data can be generated by some commands and used by other commands.

A command accesses grid data from a compute or fix using a *grid reference* with the following syntax:

- *c_ID:gname:dname*
- *c_ID:gname:dname[I]*
- *f_ID:gname:dname*
- *f_ID:gname:dname[I]*

The prefix “c_” or “f_” refers to the ID of the compute or fix; gname is the name of the grid, which is assigned by the compute or fix; dname is the name of the data field, which is also assigned by the compute or fix.

If the data field is a per-grid vector (one value per grid point), then no brackets are used to access the values. If the data field is a per-grid array (multiple values per grid point), then brackets are used to specify the column I of the array. I ranges from 1 to Ncol inclusive, where Ncol is the number of columns in the array and is defined by the compute or fix.

Currently, there are no per-grid variables implemented in LAMMPS. We may add this feature at some point.

10.3.5 Calculate temperature

Temperature is computed as kinetic energy divided by some number of degrees of freedom (and the Boltzmann constant). Since kinetic energy is a function of particle velocity, there is often a need to distinguish between a particle’s advection velocity (due to some aggregate motion of particles) and its thermal velocity. The sum of the two is the particle’s total velocity, but the latter is often what is wanted to compute a temperature.

LAMMPS has several options for computing temperatures, any of which can be used in *thermostatting* and *barostatting*. These *compute commands* calculate temperature:

- *compute temp*
- *compute temp/sphere*
- *compute temp/asphere*
- *compute temp/com*
- *compute temp/deform*
- *compute temp/partial*
- *compute temp/profile*
- *compute temp/ramp*
- *compute temp/region*

All but the first 3 calculate velocity biases directly (e.g. advection velocities) that are removed when computing the thermal temperature. *Compute temp/sphere* and *compute temp/asphere* compute kinetic energy for finite-size particles that includes rotational degrees of freedom. They both allow for velocity biases indirectly, via an optional extra argument which is another temperature compute that subtracts a velocity bias. This allows the translational velocity of spherical or aspherical particles to be adjusted in prescribed ways.

10.3.6 Calculate elastic constants

Elastic constants characterize the stiffness of a material. The formal definition is provided by the linear relation that holds between the stress and strain tensors in the limit of infinitesimal deformation. In tensor notation, this is expressed as

$$s_{ij} = C_{ijkl}e_{kl}$$

where the repeated indices imply summation. s_{ij} are the elements of the symmetric stress tensor. e_{kl} are the elements of the symmetric strain tensor. C_{ijkl} are the elements of the fourth rank tensor of elastic constants. In three dimensions, this tensor has $3^4 = 81$ elements. Using Voigt notation, the tensor can be written as a 6x6 matrix, where C_{ij} is now the derivative of s_i w.r.t. e_j . Because s_i is itself a derivative w.r.t. e_i , it follows that C_{ij} is also symmetric, with at most $\frac{7 \times 6}{2} = 21$ distinct elements.

At zero temperature, it is easy to estimate these derivatives by deforming the simulation box in one of the six directions using the *change_box* command and measuring the change in the stress tensor. A general-purpose script that does this is given in the *examples/ELASTIC* directory described on the *Examples* doc page.

Calculating elastic constants at finite temperature is more challenging, because it is necessary to run a simulation that performs time averages of differential properties. There are at least 3 ways to do this in LAMMPS. The most reliable way to do this is by exploiting the relationship between elastic constants, stress fluctuations, and the Born matrix, the second derivatives of energy w.r.t. strain ([Ray](#)). The Born matrix calculation has been enabled by the `compute born/matrix` command, which works for any bonded or non-bonded potential in LAMMPS. The most expensive part of the calculation is the sampling of the stress fluctuations. Several examples of this method are provided in the `examples/ELASTIC_T/BORN_MATRIX` directory described on the [Examples](#) doc page.

A second way is to measure the change in average stress tensor in an NVT simulations when the cell volume undergoes a finite deformation. In order to balance the systematic and statistical errors in this method, the magnitude of the deformation must be chosen judiciously, and care must be taken to fully equilibrate the deformed cell before sampling the stress tensor. An example of this method is provided in the `examples/ELASTIC_T/DEFORMATION` directory described on the [Examples](#) doc page.

Another approach is to sample the triclinic cell fluctuations that occur in an NPT simulation. This method can also be slow to converge and requires careful post-processing ([Shinoda](#)). We do not provide an example of this method.

A nice review of the advantages and disadvantages of all of these methods is provided in the paper by Clavier et al. ([Clavier](#)).

(Shinoda) Shinoda, Shiga, and Mikami, Phys Rev B, 69, 134103 (2004).

(Clavier) G. Clavier, N. Desbiens, E. Bourasseau, V. Lachet, N. Brusselle-Dupend and B. Rousseau, Mol Sim, 43, 1413 (2017).

10.3.7 Calculate thermal conductivity

The thermal conductivity κ of a material can be measured in at least 4 ways using various options in LAMMPS. See the `examples/KAPPA` directory for scripts that implement the 4 methods discussed here for a simple Lennard-Jones fluid model. Also, see the [Howto viscosity](#) page for an analogous discussion for viscosity.

The thermal conductivity tensor κ is a measure of the propensity of a material to transmit heat energy in a diffusive manner as given by Fourier's law

$$J = -\kappa \cdot \text{grad}(T)$$

where J is the heat flux in units of energy per area per time and $\text{grad}(T)$ is the spatial gradient of temperature. The thermal conductivity thus has units of energy per distance per time per degree K and is often approximated as an isotropic quantity, i.e. as a scalar.

The first method is to setup two thermostatted regions at opposite ends of a simulation box, or one in the middle and one at the end of a periodic box. By holding the two regions at different temperatures with a [thermostatting fix](#), the energy added to the hot region should equal the energy subtracted from the cold region and be proportional to the heat flux moving between the regions. See the papers by [Ikeshoji and Hafskjold](#) and [Wirnsberger et al](#) for details of this idea. Note that thermostatting fixes such as `fix nvt`, `fix langevin`, and `fix temp/rescale` store the cumulative energy they add/subtract.

Alternatively, as a second method, the `fix heat` or `fix ehex` commands can be used in place of thermostats on each of two regions to add/subtract specified amounts of energy to both regions. In both cases, the resulting temperatures of the two regions can be monitored with the “compute temp/region” command and the temperature profile of the intermediate region can be monitored with the `fix ave/chunk` and `compute ke/atom` commands.

The third method is to perform a reverse non-equilibrium MD simulation using the `fix thermal/conductivity` command which implements the rNEMD algorithm of Muller-Plathe. Kinetic energy is swapped between atoms in two different layers of the simulation box. This induces a temperature gradient between the two layers which can be monitored with

the *fix ave/chunk* and *compute ke/atom* commands. The fix tallies the cumulative energy transfer that it performs. See the *fix thermal/conductivity* command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the heat flux to κ . The heat flux can be calculated from the fluctuations of per-atom potential and kinetic energies and per-atom stress tensor in a steady-state equilibrated simulation. This is in contrast to the two preceding non-equilibrium methods, where energy flows continuously between hot and cold regions of the simulation box.

The *compute heat/flux* command can calculate the needed heat flux and describes how to implement the Green_Kubo formalism using additional LAMMPS commands, such as the *fix ave/correlate* command to calculate the needed auto-correlation. See the page for the *compute heat/flux* command for an example input script that calculates the thermal conductivity of solid Ar via the GK formalism.

(Ikeshoji) Ikeshoji and Hafskjold, Molecular Physics, 81, 251-261 (1994).

(Wirnsberger) Wirnsberger, Frenkel, and Dellago, J Chem Phys, 143, 124104 (2015).

10.3.8 Calculate viscosity

The shear viscosity η of a fluid can be measured in at least 6 ways using various options in LAMMPS. See the *examples/VISCOSITY* directory for scripts that implement the 5 methods discussed here for a simple Lennard-Jones fluid model and 1 method for SPC/E water model. Also, see the *page on calculating thermal conductivity* for an analogous discussion for thermal conductivity.

η is a measure of the propensity of a fluid to transmit momentum in a direction perpendicular to the direction of velocity or momentum flow. Alternatively it is the resistance the fluid has to being sheared. It is given by

$$J = -\eta \cdot \text{grad}(V_{\text{stream}})$$

where J is the momentum flux in units of momentum per area per time. and $\text{grad}(V_{\text{stream}})$ is the spatial gradient of the velocity of the fluid moving in another direction, normal to the area through which the momentum flows. Viscosity thus has units of pressure-time.

The first method is to perform a non-equilibrium MD (NEMD) simulation by shearing the simulation box via the *fix deform* command, and using the *fix nvt/sllod* command to thermostat the fluid via the SLLOD equations of motion. Alternatively, as a second method, one or more moving walls can be used to shear the fluid in between them, again with some kind of thermostat that modifies only the thermal (non-shearing) components of velocity to prevent the fluid from heating up.

Note

A recent (2017) book by (Daivis and Todd) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostating generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

In both cases, the velocity profile setup in the fluid by this procedure can be monitored by the *fix ave/chunk* command, which determines $\text{grad}(V_{\text{stream}})$ in the equation above. E.g. the derivative in the y-direction of the V_x component of fluid motion or $\text{grad}(V_{\text{stream}}) = \frac{dV_x}{dy}$. The P_{xy} off-diagonal component of the pressure or stress tensor, as calculated by the *compute pressure* command, can also be monitored, which is the J term in the equation above. See the *Howto nemd* page for details on NEMD simulations.

The third method is to perform a reverse non-equilibrium MD simulation using the *fix viscosity* command which implements the rNEMD algorithm of Muller-Plathe. Momentum in one dimension is swapped between atoms in two different layers of the simulation box in a different dimension. This induces a velocity gradient which can be monitored with the *fix ave/chunk* command. The fix tallies the cumulative momentum transfer that it performs. See the *fix viscosity* command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the stress/pressure tensor to η . This can be done in a fully equilibrated simulation which is in contrast to the two preceding non-equilibrium methods, where momentum flows continuously through the simulation box.

Here is an example input script that calculates the viscosity of liquid Ar via the GK formalism:

```
# Sample LAMMPS input script for viscosity of liquid Ar

```

The fifth method is related to the above Green-Kubo method, but uses the Einstein formulation, analogous to the Einstein mean-square-displacement formulation for self-diffusivity. The time-integrated momentum fluxes play the role of Cartesian coordinates, whose mean-square displacement increases linearly with time at sufficiently long times.

The sixth is the periodic perturbation method, which is also a non-equilibrium MD method. However, instead of measuring the momentum flux in response to an applied velocity gradient, it measures the velocity profile in response to applied stress. A cosine-shaped periodic acceleration is added to the system via the *fix accelerate/cos* command, and the *compute viscosity/cos* command is used to monitor the generated velocity profile and remove the velocity bias before thermostating.

Note

An article by (Hess) discussed the accuracy and efficiency of these methods.

(Daivis and Todd) Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, <https://doi.org/10.1017/9781139017848>, (2017).

(Hess) Hess, B. The Journal of Chemical Physics 2002, 116 (1), 209-217.

10.3.9 Calculate diffusion coefficients

The diffusion coefficient D of a material can be measured in at least 2 ways using various options in LAMMPS. See the `examples/DIFFUSE` directory for scripts that implement the 2 methods discussed here for a simple Lennard-Jones fluid model.

The first method is to measure the mean-squared displacement (MSD) of the system, via the *compute msd* command. The slope of the MSD versus time is proportional to the diffusion coefficient. The instantaneous MSD values can be accumulated in a vector via the *fix vector* command, and a line fit to the vector to compute its slope via the *variable slope* function, and thus extract D .

The second method is to measure the velocity auto-correlation function (VACF) of the system, via the *compute vacf* command. The time-integral of the VACF is proportional to the diffusion coefficient. The instantaneous VACF values can be accumulated in a vector via the *fix vector* command, and time integrated via the *variable trap* function, and thus extract D .

10.4 Force fields howto

10.4.1 Some general force field considerations

A compact summary of the concepts, definitions, and properties of force fields with explicit bonded interactions (like the ones discussed in this HowTo) is given in ([Gissinger](#)).

A force field has 2 parts: the formulas that define its potential functions and the coefficients used for a particular system. To assign parameters it is first required to assign atom types. Those are not only based on the elements, but also on the chemical environment due to the atoms bound to them. This often follows the chemical concept of *functional groups*. Example: a carbon atom bound with a single bond to a single OH-group (alcohol) would be a different atom type than a carbon atom bound to a methyl CH₃ group (aliphatic carbon). The atom types usually then determine the non-bonded Lennard-Jones parameters and the parameters for bonds, angles, dihedrals, and impropers. On top of that, partial charges have to be applied. Those are usually independent of the atom types and are determined either for groups of atoms called residues with some fitting procedure based on quantum mechanical calculations, or based on some increment system that add or subtract increments from the partial charge of an atom based on the types of the neighboring atoms.

Force fields differ in the strategies they employ to determine the parameters and charge distribution in how generic or specific they are which in turn has an impact on the accuracy (compare for example CGenFF to CHARMM and GAFF to AMBER). Because of the different strategies, it is not a good idea to use a mix of parameters from different force field *families* (like CHARMM, AMBER, or GROMOS) and that extends to the parameters for the solvent, especially water. The publication describing the parameterization of a force field will describe which water model to use. Changing the water model usually leads to overall worse results (even if it may improve on the water itself).

In addition, one has to consider that *families* of force fields like CHARMM, AMBER, OPLS, or GROMOS have evolved over time and thus provide different *revisions* of the force field parameters. These often corresponds to changes in the functional form or the parameterization strategies. This may also result in changes required for simulation settings like the preferred cutoff or how Coulomb interactions are computed (cutoff, smoothed/shifted cutoff, or long-range with Ewald summation or equivalent). Unless explicitly stated in the publication describing the force field, the Coulomb interaction cannot be chosen at will but must match the revision of the force field. That said, liberties may be taken during the initial equilibration of a system to speed up the process, but not for production simulations.

(**Gissinger**) J. R. Gissinger, I. Nikiforov, Y. Afshar, B. Waters, M. Choi, D. S. Karls, A. Stukowski, W. Im, H. Heinz, A. Kohlmeier, and E. B. Tadmor, J Phys Chem B, 128, 3282-3297 (2024).

10.4.2 CHARMM, AMBER, COMPASS, ClassII-xe, DREIDING, and OPLS force fields

Here we only discuss formulas implemented in LAMMPS that correspond to formulas commonly used in the CHARMM, AMBER, COMPASS, and DREIDING force fields. Setting coefficients is done either from special sections in an input data file via the `read_data` command or in the input script with commands like `pair_coeff` or `bond_coeff` and so on. See the [Tools](#) doc page for additional tools that can use CHARMM, AMBER, or Materials Studio generated files to assign force field coefficients and convert their output into LAMMPS input. LAMMPS input scripts can also be generated by charmm-gui.org.

CHARMM and AMBER

The CHARMM force field (*MacKerell*) and AMBER force field (*Cornell*) have potential energy function of the form

$$\begin{aligned}
 V = & \sum_{bonds} E_b + \sum_{angles} E_a + \overbrace{\sum_{dihedral} E_d}^{charmm \ charmmfsw} + \sum_{impropers} E_i \\
 & + \underbrace{\sum_{pairs} (E_{LJ} + E_{coul})}_{\substack{lj/charmm/coul/charmm \\ lj/charmm/coul/charmm/implicit \\ lj/charmm/coul/long \\ lj/charmm/coul/msm \\ lj/charmmfsw/coul/charmmfsh \\ lj/charmmfsw/coul/long}} + \sum_{special} E_s + \sum_{residues} CMAP(\phi, \psi)
 \end{aligned}$$

The terms are computed by bond styles (relationship between two atoms), angle styles (between 3 atoms), dihedral/improper styles (between 4 atoms), pair styles (non-covalently bonded pair interactions) and special bonds. The CMAP term (see *fix cmap* command for details) corrects for pairs of dihedral angles (“Correction MAP”) to significantly improve the structural and dynamic properties of proteins in crystalline and solution environments (*Brooks*). The AMBER force field does not include the CMAP term.

The interaction styles listed below compute force field formulas that are consistent with common options in CHARMM or AMBER. See each command’s documentation for the formula it computes.

- *bond_style harmonic*
- *angle_style charmm*
- *dihedral_style charmmfsh*
- *dihedral_style charmm*
- *pair_style lj/charmmfsw/coul/charmmfsh*
- *pair_style lj/charmmfsw/coul/long*
- *pair_style lj/charmm/coul/charmm*
- *pair_style lj/charmm/coul/charmm/implicit*
- *pair_style lj/charmm/coul/long*
- *special_bonds charmm*
- *special_bonds amber*

The pair styles compute Lennard Jones (LJ) and Coulombic interactions with additional switching or shifting functions that ramp the energy and/or force smoothly to zero between an inner (*a*) and outer (*b*) cutoff. The older styles with *charmm* (not *charmmfsw* or *charmmfsh*) in their name compute the LJ and Coulombic interactions with an energy switching function (*esw*) $S(r)$ which ramps the energy smoothly to zero between the inner and outer cutoff. This can cause irregularities in pairwise forces (due to the discontinuous second derivative of energy at the boundaries of the switching region), which in some cases can result in complications in energy minimization and detectable artifacts in MD simulations.

$$LJ(r) = 4\epsilon \left[\left(\frac{\sigma}{r} \right)^{12} - \left(\frac{\sigma}{r} \right)^6 \right]$$

$$C(r) = \frac{Cq_i q_j}{\epsilon r}$$

$$S(r) = \frac{(b^2 - r^2)^2 (b^2 + 2r^2 - 3a^2)}{(b^2 - a^2)^3}$$

$$E_{LJ}(r) = \begin{cases} LJ(r), & r \leq a \\ LJ(r)S(r), & a < r \leq b \\ 0, & r > b \end{cases}$$

$$E_{coul}(r) = \begin{cases} C(r), & r \leq a \\ C(r)S(r), & a < r \leq b \\ 0, & r > b \end{cases}$$

The newer styles with *charmmfsw* or *charmmfsh* in their name replace energy switching with force switching (fsw) for LJ interactions and force shifting (fsh) functions for Coulombic interactions ([Steinbach](#))

$$E_{LJ}(r) = \begin{cases} 4\epsilon\sigma^6 \left(\frac{\sigma^6 - r^6}{r^{12}} - \frac{\sigma^6}{a^6 b^6} + \frac{1}{a^3 b^3} \right) & r \leq a \\ \frac{4\epsilon\sigma^6 \left(\sigma^6 (b^6 - r^6)^2 - b^3 r^6 (a^3 + b^3) (b^3 - r^3)^2 \right)}{b^6 r^{12} (b^6 - a^6)} & a < r \leq b \\ 0, & r > b \end{cases}$$

$$E_{coul}(r) = \begin{cases} C(r) \frac{(b-r)^2}{rb^2}, & r \leq b \\ 0, & r > b \end{cases}$$

These styles are used by LAMMPS input scripts generated by <https://charmm-gui.org/> (Brooks).

Note

For CHARMM, newer *charmmfsw* or *charmmfsh* styles were released in March 2017. We recommend they be used instead of the older *charmm* styles. See discussion of the differences on the *pair charmm* and *dihedral charmm* doc pages.

Note

The TIP3P water model is strongly recommended for use with the CHARMM force field. In fact, “using the SPC model with CHARMM parameters is a bad idea” and “to enable TIP4P style water in CHARMM, you would have to write a new pair style”. LAMMPS input scripts generated by Solution Builder on <https://charmm-gui.org> use TIP3P molecules for solvation. Any other water model can and probably will lead to false conclusions.

COMPASS

COMPASS is a general force field for atomistic simulation of common organic molecules, inorganic small molecules, and polymers which was developed using ab initio and empirical parameterization techniques (Sun). See the *Tools* page for the *msi2lmp* tool for creating LAMMPS template input and data files from BIOVIA’s Materials Studio files. Please note that the *msi2lmp* tool is very old and largely unmaintained, so it does not support all features of Materials Studio provided force field files, especially additions during the last decade. You should watch the output carefully and compare results, where possible. See (Sun) for a description of the COMPASS force field.

These interaction styles listed below compute force field formulas that are consistent with the COMPASS force field. See each command’s documentation for the formula it computes.

ClassII-xe

Added in version 30Mar2026.

The computationally efficient simulation of condensed-phase materials such as metals, polymers, and composites can be achieved with fixed-bond force fields. Two popular fixed-bond force fields for such materials are COMPASS ([Sun](#)) and PCFF ([Maple](#)). Both use a Class II-based functional form that incorporates anharmonic vibrational modes via the quartic Taylor-series expansion of the Hamiltonian. In addition, Class II-based force fields add intermolecular coupling via cross-term interactions that also account for more complex vibrational modes. The underlying harmonic bonds and harmonic cross-terms can limit the reliability of the physics, e.g., when calculating mechanical properties. To overcome the harmonic bonding limitations, a Morse bond ([Morse](#)) can be used in place of the quartic bond, but this improvement when modeling bond dissociation is limited when the cross-terms remain harmonic. To improve the physicality of the response of the cross-terms that couple bond stretch to other higher-order interactions (angles, dihedrals, and impropers), those respective cross-terms also need to be modified.

The cross-term potentials that model bond stretch coupling to higher-order interactions are similar in functional form to the harmonic bonding potential. Thus, the exponential function that ([Morse](#)) derived for converting a harmonic bonding potential to a bonding potential that accommodates larger bond stretches and can model bond dissociation, can also be implemented into the cross-terms. This defines the naming convention for the ClassII-xe functional form, where x refers to cross-term and e refers to an exponential function, and defines the purpose of the ClassII-xe functional form. The purpose is to allow bond dissociation in a ClassII-based force field via a consistent definition of bond dissociation via the Morse bonding potential and the higher-order cross-term coupling potentials. See ([Kemppainen](#)) for a description of the ClassII-xe functional form. The interaction styles listed below compute the force field formulas for the ClassII-xe functional form:

- *bond_style morse*
- *angle_style class2xe*
- *dihedral_style class2xe*
- *improper_style class2*
- *pair_style lj/class2*
- *pair_style lj/class2/coul/cut*
- *pair_style lj/class2/coul/long*
- *special_bonds lj/coul 0 0 1*

Since both COMPASS and PCFF are Class II-based, their parameters can be converted into the ClassII-xe functional form. The conversion from ClassII to ClassII-xe functional form requires reparameterizing the cross-terms, which can be accomplished via the LUNAR tool, for which a link is provided on the [Pre/Post processing](#) page. LUNAR can be used to build a model from scratch in either COMPASS or PCFF (using its ‘atom_typing’ and ‘all2lmp’ modules) and then convert that model to COMPASS-xe or PCFF-xe (using its ‘auto_morse_bond_update’ module). To establish a consistent naming convention for the new ClassII-xe functional form when converting from a parent force field, the -xe suffix should be added to the parent force field name (e.g. PCFF vs. PCFF-xe).

The usage of the ClassII-xe functional form can only let a bond dissociate; however, to disconnect the dissociated bond and remove the higher-order interactions, other LAMMPS commands are required, such as *fix bond/react* or *fix bond/break*. It was demonstrated that PCFF-xe (without *fix bond/react* or *fix bond/break*) can model a material up to fracture ([Kemppainen](#)), allowing for calculation of mechanical properties such as tensile and shear modulus, tensile and shear yield strength, Poisson’s ratio, etc. However, the simulation may crash after fracture if bonds beyond than the processor communication cutoff distance. Thus, post-fracture phenomena cannot be simulated without the usage of *fix bond/react* or *fix bond/break*. Note that using *fix bond/break* can cause instabilities and crashes because a discontinuity is introduced to the energy landscape when a bond is removed. On the other hand, *fix bond/react* can relax high-energy configurations via the *stabilization* keyword, whereby a small local group of atoms involved in

the discontinuity are integrated with *fix nve/limit*. LUNAR can also be used to assist with setting up simulations that include *fix bond/react*.

DREIDING

DREIDING is a generic force field developed by the [Goddard group](#) at Caltech and is useful for predicting structures and dynamics of organic, biological and main-group inorganic molecules. The philosophy in DREIDING is to use general force constants and geometry parameters based on simple hybridization considerations, rather than individual force constants and geometric parameters that depend on the particular combinations of atoms involved in the bond, angle, or torsion terms. DREIDING has an *explicit hydrogen bond term* to describe interactions involving a hydrogen atom on very electronegative atoms (N, O, F). Unlike CHARMM or AMBER, the DREIDING force field has not been parameterized for considering solvents (like water) and has no rules for assigning (partial) charges. That will seriously limit its accuracy when used for simulating systems where those matter.

See ([Mayo](#)) for a description of the DREIDING force field

The interaction styles listed below compute force field formulas that are consistent with the DREIDING force field. See each command's documentation for the formula it computes.

OPLS

OPLS (Optimized Potentials for Liquid Simulations) is a general force field for atomistic simulation of organic molecules in solvent. It was developed by the [Jorgensen group](#) at Purdue University and later at Yale University. Multiple versions of the OPLS parameters exist for united atom representations (OPLS-UA) and for all-atom representations (OPLS-AA).

This force field is based on atom types mapped to specific functional groups in organic and biological molecules. Each atom includes a static, partial atomic charge reflecting the oxidation state of the element derived from its bonded neighbors ([Jorgensen](#)) and computed based on increments determined by the atom type of the atoms bonded to it.

The interaction styles listed below compute force field formulas that are fully or in part consistent with the OPLS style force fields. See each command's documentation for the formula it computes. Some are only compatible with a subset of OPLS interactions.

10.4.3 AMBER to LAMMPS Tutorial

written by Arun Srikanth Sridhar

Added in version 11Feb2026.

AMBER2LAMMPS is a Python utility that converts AMBER topology (.prmtop) and coordinate/charge (.crd) files into LAMMPS data and parameter files. It provides both a command-line interface and a Python API with built-in validation. This tutorial provides a detailed workflow with examples using the **AMBER2LAMMPS** python utility. The legacy scripts previously distributed in `tools/amber2lmp` have been removed due to their reliance on Python 2 and lack of maintenance.

This tutorial assumes familiarity with molecular dynamics simulations and molecular mechanics force fields, including atom typing, bond topologies, partial charge assignment, and different force field families (AMBER, CHARMM, GROMOS, OPLS/AA). For an introduction to force field concepts, see *Some general force field considerations* before starting this tutorial. AMBER offers various force fields for different biomolecules, including ff19SB/ff14SB (proteins), Bsc1/OL3 (DNA/RNA), GLYCAM06 (carbohydrates), and Lipid17 (lipids), alongside the General AMBER

Force Field (GAFF/GAFF2) for small organic molecules (see <https://ambermd.org/AmberModels.php> and Wang, J., et al., J. Comput. Chem., 25, 1157-1174 (2004) for GAFF force field development).

i Important Force Field Compatibility Warning

Different force field families (AMBER, CHARMM, GROMOS, OPLS/AA) use distinct atom typing schemes, charge assignment methods, and parameterization strategies. **Never mix and match parameters from different force field families; this leads to unphysical results and simulation failures.** Always use a consistent force field family throughout your system.

What the AMBER2LAMMPS tool does

This tool helps you run molecular dynamics simulations in **LAMMPS** when you have your molecular system set up in **AMBER** format. AMBER2LAMMPS uses AmberTools utilities (antechamber and tleap) to perform the conversion.

Typical workflow:

1. Start with a molecular structure (PDB file or SMILES string to be converted to PDB)
2. Use AMBER tools to create AMBER files (.prmtop, .crd)
3. **Convert AMBER files to LAMMPS format** using this tool
4. Run your simulation in LAMMPS

What gets converted:

- ``.prmtop`` (topology file): Contains bonds, angles, atom types, and force field parameters -> LAMMPS data and parameter files
- ``.crd`` (coordinates file): Contains atomic positions -> LAMMPS coordinates

What you get as output:

- **LAMMPS data file** (e.g., data.lammps): Contains atomic coordinates, box dimensions, and molecular topology
 - **LAMMPS parameter file** (e.g., parm.lammps): Contains force field parameters for bonds, angles, and non-bonded interactions
-

AMBER2LAMMPS homepage and download

AMBER2LAMMPS is developed and maintained outside the LAMMPS repository. Download its source code from its GitHub project page or clone its repository from GitHub:

```
# direct download
curl -L -o AMBER2LAMMPS-main.tar.gz https://github.com/askforarun/AMBER2LAMMPS/archive/
↪refs/heads/main.tar.gz
tar -xzvzf AMBER2LAMMPS-main.tar.gz
cd AMBER2LAMMPS-main

# clone repository
git clone https://github.com/askforarun/AMBER2LAMMPS.git
cd AMBER2LAMMPS
```

Requirements

Platform Compatibility

AMBER2LAMMPS works on all major platforms:

- **Linux**: Full support (Ubuntu, CentOS, Fedora, etc.)
- **macOS**: Full support (Intel and Apple Silicon)
- **Windows**: Support via WSL2 or Git Bash

System Requirements

- **Structure**: PDB file (or a SMILES string that you can convert to PDB).

- **AmberTools utilities:** antechamber and tleap to build .prmtop and .crd.
- **Python packages:** parmed and numpy.
- **LAMMPS:** On your PATH (which `lmp` or `lmp -help`) and built with MOLECULE, KSPACE, and EXTRA-MOLECULE packages.
- **Optional:** Open Babel (`obabel`) if starting from SMILES.

Installing dependencies

AmberTools

Install from <https://ambermd.org/GetAmber.php#ambertools> and activate the environment:

```
conda activate Ambertools23 # or your AmberTools environment
```

To see the available force fields, run `antechamber -h`

Python packages

Using conda (recommended):

```
conda install -c conda-forge parmed numpy
```

Using pip:

```
pip install --user parmed numpy
```

Open Babel (optional, for SMILES to PDB conversion)

Using conda (recommended):

```
conda install -c conda-forge openbabel
```

Using pip:

```
pip install --user openbabel
```

Using system package manager:

```
# Ubuntu/Debian
sudo apt-get install openbabel

# Fedora/Red Hat
sudo dnf install openbabel

# macOS
brew install open-babel
```

Command Reference

Argument	Re-quired?	Description
Input Files		
topology	yes	AMBER topology file (.prmtop)
crd	yes	AMBER coordinate file (.crd)
Output Files		
data_file	yes	Output LAMMPS data filename
param_file	yes	Output LAMMPS parameter filename
Options		
-b, --buffer	optional	Vacuum padding (Angstrom) for the simulation box. Default: 3.8.
--charge	yes	Target net charge (integer). Applies a uniform offset to every atom to reach this charge (1e-6 tolerance). Does not add counterions; add those with the AMBER tools before conversion.
--keep-temp	optional	Keep temporary files (bonds.txt, angles.txt, dihedrals.txt, pairs.txt) after conversion. Default: False.
--verbose	optional	Print step-by-step progress, counts, and box size. Default: False.
-h, --help	optional	Show help message.

Conversion Process

The converter implements the following sequence (see `amber_to_lammps.py`):

1. **Input validation:** `validate_files` checks that `topology` and `crd` exist and are readable. The CLI performs this validation automatically, while the Python API requires manual validation if desired.
2. **AMBER topology load:** ParmEd reads atoms, bonds, angles, and dihedrals from `.prmtop`; counts are printed with `--verbose`.
3. **Atom typing and masses:** Atom types and masses are extracted from the topology file.
4. **Coordinates and charges:** Coordinates are read from the CRD file and charges from the topology file.
5. **Box creation** (`--buffer``): A bounding box around the coordinates is expanded by the buffer on all sides.
6. **Charge normalization:** Charges are shifted uniformly to achieve the target net charge specified by `--charge`.
7. **Non-bonded parameters:** Lennard-Jones parameters are extracted from the topology and become `pair_coeff` entries in the parameter file.
8. **Topology terms:** Bonds, angles, and dihedrals are exported via ParmEd to temporary files and written to the LAMMPS data/parameter files.
9. **Cleanup:** Temporary helper files (`bonds.txt`, `angles.txt`, `dihedrals.txt`, `pairs.txt`) are removed unless `--keep-temp` is specified.
10. **Verbose diagnostics:** With `--verbose`, the script reports counts, box extents after buffering, and the final total charge.

Charge normalization

AMBER Charge Schemes: AMBER uses various charge methods including:

- **RESP** (Restrained Electrostatic Potential): Derived from quantum mechanical electrostatic potential
- **AM1-BCC:** Semi-empirical charges with bond charge corrections

- **CM5** or **CM1A**: Charge models based on atomic charges

In this tutorial, we will use AM1-BCC charges.

Charge Normalization in AMBER2LAMMPS:

- Most systems should be overall neutral for PME to converge; small residual charges (± 0.003) from AM1-BCC (or other methods) calculated from antechamber are common.
- For neutral molecules, run with `--charge 0` so AMBER2LAMMPS applies a uniform offset that removes the residual charge; this prevents the error from scaling up when the system is replicated in LAMMPS.
- For intentionally charged species (e.g., protonated or deprotonated), add counterions in tleap/packmol before conversion. AMBER2LAMMPS never adds ions; it only shifts existing charges to your requested total.
- How the flag works: `--charge 0`: uniform shift makes the summed charge 0 within $1e-6$. `--charge +1` (or any integer): uniform shift makes the total that integer within $1e-6$. - The same constant is added to every atom, so relative charge differences are preserved.

Example: If your system has net charge +0.003 and you specify

`--charge 0`, each atom's charge will be reduced by $(0.003 / \text{number_of_atoms})$ to reach neutrality.

Workflow Examples

Prepare input files (ethanol example)

Convert SMILES to PDB (optional)

If you start from a SMILES string, generate a PDB with obabel:

```
obabel -:CCO -h -opdb -o ethanol.pdb --gen3d # adds hydrogens, recommended
obabel -:c1ccccc1 -h -opdb -o benzene.pdb --gen3d
obabel -:"CC(=O)OC1=CC=CC=C1C(=O)O" -h -opdb -o aspirin.pdb --gen3d
```

Generate AMBER topology and coordinates

Assuming ethanol.pdb is your structure:

1. Generate a MOL2 file with charges:

```
antechamber -j 4 -at gaff2 -dr yes -fi pdb -fo mol2 \
-i ethanol.pdb -o ethanol.mol2 -c bcc
```

The `-c bcc` assigns AM1-BCC charges; use the `-at` option to choose the force field.

2. Create tleap.in:

```
source leaprc.gaff2
ETH = loadmol2 ethanol.mol2
check ETH
saveamberparm SUS ethanol.prmtop ethanol.crd
quit
```

leaprc.gaff2 loads the gaff2 force field parameters that were used in step 1

3. Run tleap and inspect leap.log for errors:

```
tLeap -f tLeap.in
```

Outputs: ethanol.prmtop and ethanol.crd.

Basic conversion workflow

LAMMPS input script

Save the following LAMMPS commands in a file called `example_lammps_input.lmp`:

```
# LAMMPS Input Script for Converted AMBER System

units real
dimension 3
boundary p p p
atom_style full

read_data data.lammps

pair_style      lj/cut/coul/long 9 9
bond_style      harmonic
angle_style     harmonic
dihedral_style  fourier
special_bonds lj 0.0 0.0 0.5 coul 0.0 0.0 0.83333333

include parm.lammps

thermo_style custom ebond eangle edihed eimp epair evdwl ecoul elong etail pe
run 0
```

The above script includes the parameter file via `include parm.lammps` and loads the coordinate data via `read_data data.lammps`.

CLI usage with LAMMPS execution

Ensure `amber_to_lammps.py` is executable and the input files are accessible.

Run the converter:

```
python3 amber_to_lammps.py data.lammps parm.lammps \
    ethanol.prmtop ethanol.crd --charge 0 --verbose -b 4.5
```

Outputs: `data.lammps` (coordinates/topology) and `parm.lammps`

Run with LAMMPS:

```
lmp -in example_lammps_input.lmp
```

Additional CLI examples

```
# Custom buffer and verbose logging (adds 5 Angstroms of padding)
python3 amber_to_lammps.py my_data.lammps my_params.lammps \
```

(continues on next page)

(continued from previous page)

```

ethanol.prmtop ethanol.crd --charge 0 --verbose -b 5.0

# Custom output names
python3 amber_to_lammps.py system.data system.parm system.prmtop \
    system.crd --charge 0

# Minimal output without verbose logging
python3 amber_to_lammps.py small.data small.parm \
    ethanol.prmtop ethanol.crd --charge 0 -b 3.0

# Using absolute paths with custom buffer
python3 amber_to_lammps.py /home/user/lammps/output/data.lammps /home/user/lammps/output/
→param.lammps /home/user/amber/topology.prmtop /home/user/amber/coords.crd --charge 0 -
→b 4.5

# Keep temporary files for debugging
python3 amber_to_lammps.py debug_data.lammps debug_parm.lammps molecule.prmtop molecule.
→crd --charge 0 --keep-temp --verbose

```

Make sure to rename the files in `example_lammps_input.lmp` to match the names of the files generated by the conversion when custom file names are used.

Python API usage with LAMMPS execution

This example script uses the *LAMMPS Python module* to execute LAMMPS directly from Python.

```

from amber_to_lammps import amber2lammps, validate_files
from lammps import lammps

validate_files('ethanol.prmtop', 'ethanol.crd')

amber2lammps(
    data_file='data.lammps',
    param_file='parm.lammps',
    topology='ethanol.prmtop',
    crd='ethanol.crd',
    charge=0,
    buffer=3.8,
    verbose=True,
)

lmp = lammps()
lmp.file('example_lammps_input.lmp')
lmp.close()

```

Additional API examples

```

# Example 1: Basic conversion without validation
from amber_to_lammps import amber2lammps

amber2lammps(

```

(continues on next page)

(continued from previous page)

```

    data_file='benzene.data',
    param_file='benzene.parm',
    topology='benzene.prmtop',
    crd='benzene.crd',
    charge=0
)

# Example 2: Custom buffer and verbose output
amber2lammmps(
    data_file='ethanol.data',
    param_file='ethanol.parm',
    topology='ethanol.prmtop',
    crd='ethanol.crd',
    charge=0,
    buffer=5.0,
    verbose=True,
    keep_temp=True # Keep temporary files for inspection
)

# Example 3: Batch processing multiple molecules
from amber_to_lammmps import amber2lammmps, validate_files

molecules = ['ethanol', 'benzene', 'aspirin']

for mol in molecules:
    validate_files(f'{mol}.prmtop', f'{mol}.crd')
    amber2lammmps(
        data_file=f'{mol}.data',
        param_file=f'{mol}.parm',
        topology=f'{mol}.prmtop',
        crd=f'{mol}.crd',
        charge=0,
        verbose=True
    )

```

Validation of AMBER2LAMMPS

AMBER2LAMMPS has been validated against InterMol output. See the project page for details: <https://github.com/askforarun/AMBER2LAMMPS>

10.4.4 AMOEBA and HIPPO force fields

The AMOEBA and HIPPO polarizable force fields were developed by Jay Ponder’s group at the U Washington at St Louis. The LAMMPS implementation is based on Fortran 90 code provided by the Ponder group in their [Tinker MD software](#).

The current implementation (July 2022) of AMOEBA in LAMMPS matches the version discussed in ([Ponder](#)), ([Ren](#)), and ([Shi](#)). Likewise the current implementation of HIPPO in LAMMPS matches the version discussed in ([Rackers](#)).

These force fields can be used when polarization effects are desired in simulations of water, organic molecules, and biomolecules including proteins, provided that parameterizations (Tinker PRM force field files) are available for the systems you are interested in. Files in the LAMMPS potentials directory with a “amoeba” or “hippo” suffix can be used. The Tinker distribution and website have additional force field files as well: <https://github.com/TinkerTools/tinker/tree/release/params>.

Note that currently, HIPPO can only be used for water systems, but HIPPO files for a variety of small organic and biomolecules are in preparation by the Ponder group. Those force field files will be included in the LAMMPS distribution when available.

To use the AMOEBA or HIPPO force fields, a simulation must be 3d, and fully periodic or fully non-periodic, and use an orthogonal (not triclinic) simulation box.

The AMOEBA and HIPPO force fields contain the following terms in their energy (U) computation. Further details for AMOEBA equations are in ([Ponder](#)), further details for the HIPPO equations are in ([Rackers](#)).

$$\begin{aligned}U &= U_{\text{intermolecular}} + U_{\text{intramolecular}} \\U_{\text{intermolecular}} &= U_{\text{hal}} + U_{\text{repulsion}} + U_{\text{dispersion}} + U_{\text{multipole}} + U_{\text{polar}} + U_{\text{qxfer}} \\U_{\text{intramolecular}} &= U_{\text{bond}} + U_{\text{angle}} + U_{\text{torsion}} + U_{\text{oop}} + U_{\text{b}\theta} + U_{\text{UB}} + U_{\text{pitorsion}} + U_{\text{bitorsion}}\end{aligned}$$

For intermolecular terms, the AMOEBA force field includes only the U_{hal} , $U_{\text{multipole}}$, U_{polar} terms. The HIPPO force field includes all but the U_{hal} term. In LAMMPS, these are all computed by the `pair_style amoeba or hippo` command. Note that the $U_{\text{multipole}}$ and U_{polar} terms in this formula are not the same for the AMOEBA and HIPPO force fields.

For intramolecular terms, the U_{bond} , U_{angle} , U_{torsion} , U_{oop} terms are computed by the `bond_style class2` `angle_style amoeba`, `dihedral_style fourier`, and `improper_style amoeba` commands respectively. The `angle_style amoeba` command includes the $U_{\text{b}\theta}$ bond-angle cross term, and the U_{UB} term for a Urey-Bradley bond contribution between the I,K atoms in the IJK angle.

The $U_{\text{pitorsion}}$ term is computed by the `fix amoeba/pitortion` command. It computes 6-body interaction between a pair of bonded atoms which each have 2 additional bond partners.

The $U_{\text{bitorsion}}$ term is computed by the `fix amoeba/bitortion` command. It computes 5-body interaction between two 4-body torsions (dihedrals) which overlap, having 3 atoms in common.

These command doc pages have additional details on the terms they compute:

- `pair_style amoeba or hippo`
- `bond_style class2`
- `angle_style amoeba`
- `dihedral_style fourier`
- `improper_style amoeba`
- `fix amoeba/pitortion`
- `fix amoeba/bitortion`

To use the AMOEBA or HIPPO force fields in LAMMPS, use commands like the following appropriately in your input script. The only change needed for AMOEBA vs HIPPO simulation is for the *pair_style* and *pair_coeff* commands, as shown below. See examples/amoeba for example input scripts for both AMOEBA and HIPPO.

```
units                real                # required
atom_style           amoeba
bond_style           class2              # CLASS2 package
angle_style          amoeba
dihedral_style       fourier             # EXTRA-MOLECULE package
improper_style       amoeba
                                # required per-atom data
fix                  amtype all property/atom i_amtype ghost yes
fix                  extra all property/atom &
                                i_amgroup i_ired i_xaxis i_yaxis i_zaxis d_pval ghost yes
fix                  polaxe all property/atom i_polaxe

fix                  pit all amoeba/pitortion      # PiTorsion terms in FF
fix_modify           pit energy yes
                                # Bitorsion terms in FF
fix                  bit all amoeba/bitorsion bitorsion.ubiquitin.data
fix_modify           bit energy yes

read_data            data.ubiquitin fix amtype NULL "Tinker Types" &
                                fix pit "pitortion types" "PiTorsion Coeffs" &
                                fix pit pitortions PiTortions &
                                fix bit bitortions BiTortions

pair_style           amoeba              # AMOEBA FF
pair_coeff           * * amoeba_ubiquitin.prm amoeba_ubiquitin.key

pair_style           hippo              # HIPPO FF
pair_coeff           * * hippo_water.prm hippo_water.key

special_bonds        lj/coul 0.5 0.5 0.5 one/five yes      # 1-5 neighbors
```

The data file read by the *read_data* command should be created by the tools/tinker/tinker2lmp.py conversion program described below. It will create a section in the data file with the header “Tinker Types”. A *fix property/atom* command for the data must be specified before the *read_data* command. In the example above the fix ID is *amtype*.

Similarly, if the system you are simulating defines AMOEBA/HIPPO pitortion or bitorsion interactions, there will be entries in the data file for those interactions. They require a *fix amoeba/pitortion* and *fix amoeba/bitorsion* command be defined. In the example above, the IDs for these two fixes are *pit* and *bit*.

Of course, if the system being modeled does not have one or more of the following – bond, angle, dihedral, improper, pitortion, bitorsion interactions – then the corresponding style and fix commands above do not need to be used. See the example scripts in examples/amoeba for water systems as examples; they are simpler than what is listed above.

The two *fix property/atom* commands with IDs (in the example above) *extra* and *polaxe* are also needed to define internal per-atom quantities used by the AMOEBA and HIPPO force fields.

The *pair_coeff* command used for either the AMOEBA or HIPPO force field takes two arguments for Tinker force field files, namely a PRM and KEY file. The keyfile can be specified as NULL and default values for a various settings will be used. Note that these 2 files are meant to allow use of native Tinker files as-is. However LAMMPS does not support all the options which can be included in a Tinker PRM or KEY file. See specifics below.

A *special_bonds* command with the *one/five* option is required, since the AMOEBA/HIPPO force fields define weighting factors for not only 1-2, 1-3, 1-4 interactions, but also 1-5 interactions. This command will trigger a per-atom list of 1-5 neighbors to be generated. The AMOEBA and HIPPO force fields define their own custom weighting factors for all the 1-2, 1-3, 1-4, 1-5 terms which in the Tinker PRM and KEY files; they can be different for different terms in the force field.

In addition to the list above, these command doc pages have additional details:

- *atom_style amoeba*
 - *fix property/atom*
 - *special_bonds*
-

Tinker PRM and KEY files

A Tinker PRM file is composed of sections, each of which has multiple lines. This is the list of PRM sections LAMMPS knows how to parse and use. Any other sections are skipped:

- Angle Bending Parameters
- Atom Type Definitions
- Atomic Multipole Parameters
- Bond Stretching Parameters
- Charge Penetration Parameters
- Charge Transfer Parameters
- Dipole Polarizability Parameters
- Dispersion Parameters
- Force Field Definition
- Literature References
- Out-of-Plane Bend Parameters
- Pauli Repulsion Parameters
- Pi-Torsion Parameters
- Stretch-Bend Parameters
- Torsion-Torsion Parameters
- Torsional Parameters
- Urey-Bradley Parameters
- Van der Waals Pair Parameters
- Van der Waals Parameters

A Tinker KEY file is composed of lines, each of which has a keyword followed by zero or more parameters. This is the list of keywords LAMMPS knows how to parse and use in the same manner Tinker does. Any other keywords are skipped. The value in parenthesis is the default value for the keyword if it is not specified, or if the keyfile in the *pair_coeff* command is specified as NULL:

- a-axis (0.0)

Tinker2lmp.py tool

This conversion tool is found in the tools/tinker directory. As shown in examples/amoeba/README, these commands produce the data files found in examples/amoeba, and also illustrate all the options available to use with the tinker2lmp.py script:

```
python tinker2lmp.py -xyz water_dimer.xyz -amoeba amoeba_water.prm -data data.water_
→dimer.amoeba                # AMOEBA non-periodic system
python tinker2lmp.py -xyz water_dimer.xyz -hippo hippo_water.prm -data data.water_dimer.
→hippo                      # HIPPO non-periodic system
python tinker2lmp.py -xyz water_box.xyz -amoeba amoeba_water.prm -data data.water_box.
→amoeba -pbc 18.643 18.643 18.643 # AMOEBA periodic system
python tinker2lmp.py -xyz water_box.xyz -hippo hippo_water.prm -data data.water_box.
→hippo -pbc 18.643 18.643 18.643 # HIPPO periodic system
python tinker2lmp.py -xyz ubiquitin.xyz -amoeba amoeba_ubiquitin.prm -data data.
→ubiquitin.new -pbc 54.99 41.91 41.91 -bitorsion bitorsion.ubiquitin.data.new #
→system with bitorsions
```

Switches and their arguments may be specified in any order.

The -xyz switch is required and specifies an input XYZ file as an argument. The format of this file is an extended XYZ format defined and used by Tinker for its input. Example *.xyz files are in the examples/amoeba directory. The file lists the atoms in the system. Each atom has the following information: Tinker species name (ignored by LAMMPS), xyz coordinates, Tinker numeric type, and a list of atom IDs the atom is bonded to.

Here is more information about the extended XYZ format defined and used by Tinker, and links to programs that convert standard PDB files to the extended XYZ format:

- https://dasher.wustl.edu/tinker/distribution/doc/sphinx/tinker/_build/html/text/file-types.html
- https://openbabel.org/docs/FileFormats/Tinker_XYZ_format.html
- <https://github.com/emleddin/pdbxyz-xyzpdb>
- <https://github.com/TinkerTools/tinker/blob/release/source/pdbxyz.f>

The -amoeba or -hippo switch is required. It specifies an input AMOEBA or HIPPO PRM force field file as an argument. This should be the same file used by the *pair_style* command in the input script.

The -data switch is required. It specifies an output file name for the LAMMPS data file that will be produced.

For periodic systems, the -pbc switch is required. It specifies the periodic box size for each dimension (x,y,z). For a Tinker simulation these are specified in the KEY file.

The -bitorsion switch is only needed if the system contains Tinker bitorsion interactions. The data for each type of bitorsion interaction will be written to the specified file, and read by the *fix amoeba/bitorsion* command. The data includes 2d arrays of values to which splines are fit, and thus is not compatible with the LAMMPS data file format.

10.4.5 TIP3P water model

The TIP3P water model as implemented in CHARMM (*MacKerell*) specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the three atoms.

One suitable pair style with cutoff Coulomb would for instance be:

- *pair_style lj/cut/coul/cut*

These commands are examples for a long-range Coulomb model:

- *pair_style lj/cut/coul/long*
- *pair_style lj/cut/coul/long/soft*
- *kspace_style pppm*
- *pair_style lj/long/coul/long*
- *kspace_style pppm/disp*

And these pair styles are compatible with the CHARMM force field:

- *pair_style lj/charmm/coul/charmm*
- *pair_style lj/charmm/coul/long*
- *pair_style lj/charmmfsw/coul/long*

In LAMMPS the *fix shake* or *fix rattle* command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used. In case of rigid bonds also bond style *zero* and angle style *zero* can be used.

The table below lists the force field parameters (in real *units*) to for the water molecule atoms to run a rigid or flexible TIP3P-CHARMM model with a cutoff, the original 1983 TIP3P model (*Jorgensen*), or a TIP3P model with parameters optimized for a long-range Coulomb solver (e.g. Ewald or PPPM in LAMMPS) (*Price*). The K values can be used if a flexible TIP3P model (without fix shake) is desired, for rigid bonds/angles they are ignored.

Parameter	TIP3P-CHARMM	TIP3P (original)	TIP3P (Ewald)
O mass (amu)	15.9994	15.9994	15.9994
H mass (amu)	1.008	1.008	1.008
O charge (<i>e</i>)	-0.834	-0.834	-0.834
H charge (<i>e</i>)	0.417	0.417	0.417
LJ ϵ of OO (kcal/mole)	0.1521	0.1521	0.1020
LJ σ of OO (Å)	3.1507	3.1507	3.188
LJ ϵ of HH (kcal/mole)	0.0460	0.0	0.0
LJ σ of HH (Å)	0.4	1.0	1.0
LJ ϵ of OH (kcal/mole)	0.0836	0.0	0.0
LJ σ of OH (Å)	1.7753	1.0	1.0
K of OH bond (kcal/mole/Å ²)	450	450	450
r_0 of OH bond (Å)	0.9572	0.9572	0.9572
K of HOH angle (kcal/mole)	55.0	55.0	55.0
θ_0 of HOH angle	104.52°	104.52°	104.52°

Below is the code for a LAMMPS input file and a molecule file (*tip3p.mol*) of TIP3P water for use with the *molecule* command demonstrating how to set up a small bulk water system for TIP3P with rigid bonds. For simplicity and speed the example uses a cutoff Coulomb. Most production simulations require long-range Coulomb instead.

10.4.6 TIP4P and OPC water models

The four-point TIP4P rigid water model extends the traditional *three-point TIP3P* model by adding an additional site M, usually massless, where the charge associated with the oxygen atom is placed. This site M is located at a fixed distance away from the oxygen along the bisector of the HOH bond angle. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used. In case of rigid bonds also bond style *zero* and angle style *zero* can be used. Very similar to the TIP4P model is the OPC water model. It can be realized the same way as TIP4P but has different geometry and force field parameters.

There are two ways to implement TIP4P-like water in LAMMPS:

1. Use a specially written pair style that uses the *TIP3P geometry* without the point M. The point M location is then implicitly derived from the other atoms or each water molecule and used during the force computation. The forces on M are then projected on the oxygen and the two hydrogen atoms. This is computationally very efficient, but the charge distribution in space is only correct within the *tip4p* labeled styles. So all other computations using charges will “see” the negative charge incorrectly located on the oxygen atom unless they are specially written for using the TIP4P geometry internally as well, e.g. *compute dipole/tip4p*, *fix efield/tip4p*, or *kpspace_style pppm/tip4p*.

This can be done with the following pair styles for Coulomb with a cutoff:

- *pair_style tip4p/cut*
- *pair_style lj/cut/tip4p/cut*

or these commands for a long-range Coulomb treatment:

- *pair_style tip4p/long*
- *pair_style lj/cut/tip4p/long*
- *pair_style lj/long/tip4p/long*
- *pair_style tip4p/long/soft*
- *pair_style lj/cut/tip4p/long/soft*
- *kpspace_style pppm/tip4p*
- *kpspace_style pppm/disp/tip4p*

The bond lengths and bond angles should be held fixed using the *fix shake* or *fix rattle* command, unless a parameterization for a flexible TIP4P model is used. The parameter sets listed below are all for rigid TIP4P model variants and thus the bond and angle force constants are not used and can be set to any legal value; only equilibrium length and angle are used.

2. Use an *explicit 4 point TIP4P geometry* where the oxygen atom carries no charge and the M point no Lennard-Jones interactions. Since *fix shake* or *fix rattle* may not be applied to this kind of geometry, *fix rigid* or *fix rigid/small* or its thermostatted variants are required to maintain a rigid geometry. This avoids some of the issues with respect to analysis and non-*tip4p* styles, but it is a more costly force computation (more atoms in the same volume and thus more neighbors in the neighbor lists) and requires a much shorter timestep for stable integration of the rigid body motion. Since no bonds or angles are required, they do not need to be defined and atom style charge would be sufficient for a bulk TIP4P water system. In order to avoid that LAMMPS produces an error due to the massless M site a tiny non-zero mass needs to be assigned.

The table below lists the force field parameters (in real *units*) to for a selection of popular variants of the TIP4P model. There is the rigid TIP4P model with a cutoff (*Jorgensen*), the TIP4/Ice model (*Abascal1*), the TIP4P/2005 model (*Abascal2*) and a version of TIP4P parameters adjusted for use with a long-range Coulombic solver (e.g. Ewald or

PPPM in LAMMPS). Note that for implicit TIP4P models the OM distance is specified in the *pair_style* command, not as part of the pair coefficients. Also parameters for the OPC model (*Izadi*) are provided.

Parameter	TIP4P (original)	TIP4P/Ice	TIP4P/2005	TIP4P (Ewald)	OPC
O mass (amu)	15.9994	15.9994	15.9994	15.9994	15.9994
H mass (amu)	1.008	1.008	1.008	1.008	1.008
O or M charge (<i>e</i>)	-1.040	-1.1794	-1.1128	-1.04844	-1.3582
H charge (<i>e</i>)	0.520	0.5897	0.5564	0.52422	0.6791
LJ ϵ of OO (kcal/mole)	0.1550	0.21084	0.1852	0.16275	0.21280
LJ σ of OO (Å)	3.1536	3.1668	3.1589	3.16435	3.1660
LJ ϵ of HH, MM, OH, OM, HM (kcal/mole)	0.0	0.0	0.0	0.0	0.0
LJ σ of HH, MM, OH, OM, HM (Å)	1.0	1.0	1.0	1.0	1.0
r_0 of OH bond (Å)	0.9572	0.9572	0.9572	0.9572	0.8724
θ_0 of HOH angle	104.52°	104.52°	104.52°	104.52°	103.60°
OM distance (Å)	0.15	0.1577	0.1546	0.1250	0.1594

Note that when using a TIP4P pair style, the neighbor list cutoff for Coulomb interactions is effectively extended by a distance 2 * (OM distance), to account for the offset distance of the fictitious charges on O atoms in water molecules. Thus, it is typically best in an efficiency sense to use a LJ cutoff $\geq$ Coulomb cutoff + 2*(OM distance), to shrink the size of the neighbor list. This leads to slightly larger cost for the long-range calculation, so you can test the trade-off for your model. The OM distance and the LJ and Coulombic cutoffs are set in the *pair_style lj/cut/tip4p/long* command.

In addition, each TIP4P water molecule's O atom and its two H atoms must be present within the ghost-atom communication cutoff, so that the position of the massless M-site charge can be reconstructed. This is normally ensured automatically by the bond style (which sets a bond-length-based communication cutoff) together with the *neighbor* skin distance. If you use a no-op bond style (e.g. *bond_style zero*) or unusually short cutoffs, LAMMPS will warn that the communication cutoff is shorter than the bond-length-based estimate and the run may abort with an "Out of range atoms" error; in that case enlarge the ghost cutoff with *comm_modify cutoff*.

Below is the code for a LAMMPS input file using the implicit method and the *TIP3P molecule file*. Because the TIP4P charges are different from TIP3P they need to be reset (or the molecule file changed). For simplicity and speed the example uses a cutoff Coulomb. Most production simulations require long-range Coulomb instead.

Below is the code for a LAMMPS input file using the explicit method and a TIP4P molecule file. Because of using *fix rigid/small* no bonds need to be defined and thus no extra storage needs to be reserved for them, but we need to either switch to atom style full or use *fix property/atom mol* so that fix rigid/small can identify rigid bodies by their molecule ID. Also a *neigh_modify exclude* command is added to exclude computing intramolecular non-bonded interactions, since those are removed by the rigid fix anyway:

10.4.7 TIP5P water model

The five-point TIP5P rigid water model extends the *three-point TIP3P model* by adding two additional sites L, usually massless, where the charge associated with the oxygen atom is placed. These sites L are located at a fixed distance away from the oxygen atom, forming a tetrahedral angle that is rotated by 90 degrees from the HOH plane. Those sites thus somewhat approximate lone pairs of the oxygen and consequently improve the water structure to become even more “tetrahedral” in comparison to the *four-point TIP4P model*.

A suitable pair style with cutoff Coulomb would be:

- *pair_style lj/cut/coul/cut*

or these commands for a long-range model:

- *pair_style lj/cut/coul/long*
- *pair_style lj/cut/coul/long/soft*
- *kspace_style pppm*
- *kspace_style pppm/disp*

A TIP5P model *must* be run using a *rigid fix* since there is no other option to keep this kind of structure rigid in LAMMPS. In order to avoid that LAMMPS produces an error due to the massless L sites, those need to be assigned a tiny non-zero mass.

The table below lists the force field parameters (in real *units*) to for a the TIP5P model with a cutoff (*Mahoney*) and the TIP5P-E model (*Rick*) for use with a long-range Coulombic solver (e.g. Ewald or PPPM in LAMMPS).

Parameter	TIP5P	TIP5P-E
O mass (amu)	15.9994	15.9994
H mass (amu)	1.008	1.008
O charge (<i>e</i>)	0.0	0.0
L charge (<i>e</i>)	-0.241	-0.241
H charge (<i>e</i>)	0.241	0.241
LJ ϵ of OO (kcal/mole)	0.1600	0.1780
LJ σ of OO (Å)	3.1200	3.0970
LJ ϵ of HH, LL, OH, OL, HL (kcal/mole)	0.0	0.0
LJ σ of HH, LL, OH, OL, HL (Å)	1.0	1.0
r_0 of OH bond (Å)	0.9572	0.9572
θ_0 of HOH angle	104.52°	104.52°
OL distance (Å)	0.70	0.70
θ_0 of LOL angle	109.47°	109.47°

Below is the code for a LAMMPS input file for setting up a simulation of TIP5P water with a molecule file. Because of using *fix rigid/small* no bonds need to be defined and thus no extra storage needs to be reserved for them, but we need to either switch to atom style full or use *fix property/atom mol* so that fix rigid/small can identify rigid bodies by their molecule ID. Also a *neigh_modify exclude* command is added to exclude computing intramolecular non-bonded interactions, since those are removed by the rigid fix anyway. For simplicity and speed the example uses a cutoff Coulomb. Most production simulations require long-range Coulomb instead.

10.4.8 SPC and SPC/E water model

The SPC water model specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the three atoms. In LAMMPS the *fix shake* command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used.

One suitable pair style with cutoff Coulomb would for instance be:

- *pair_style lj/cut/coul/cut*

These commands are examples for a long-range Coulomb model:

- *pair_style lj/cut/coul/long*
- *pair_style lj/cut/coul/long/soft*
- *kpace_style ppm*
- *pair_style lj/long/coul/long*
- *kpace_style ppm/disp*

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid SPC model.

O mass = 15.9994

H mass = 1.008

O charge = -0.820

H charge = 0.410

LJ ϵ of OO = 0.1553

LJ σ of OO = 3.166

LJ ϵ , σ of OH, HH = 0.0

r_0 of OH bond = 1.0

θ_0 of HOH angle = 109.47°

Note that as originally proposed, the SPC model was run with a 9 Angstrom cutoff for both LJ and Coulomb terms. It can also be used with long-range electrostatic solvers (e.g. Ewald or PPPM in LAMMPS) without changing any of the parameters above, although it becomes a different model in that mode of usage.

The SPC/E (extended) water model is the same, except the partial charge assignments change:

O charge = -0.8476

H charge = 0.4238

See the ([Berendsen2](#)) reference for more details on both the SPC and SPC/E models.

Below is the code for a LAMMPS input file and a molecule file (`spce.mol`) of SPC/E water for use with the *molecule* command demonstrating how to set up a small bulk water system for SPC/E with rigid bonds. For simplicity and speed the example uses a cutoff Coulomb. Most production simulations require long-range Coulomb instead.

10.4.9 Two-band (and multi-band) EAM potentials with hybrid/overlay

Some embedded-atom-method (EAM) potentials add a *second* embedding term to the standard EAM energy expression in order to capture effects that a single density and embedding function cannot. The best known examples are the *two-band* (or *double-band*, “2BM”) models for Fe-Cr, which add an “s-band” embedding term on top of the usual “d-band” EAM so that the sign of the alloy mixing enthalpy changes with chromium concentration (*Olsson*), (*Bonny*).

This Howto shows that such a model can be run with the existing *pair_style eam/fs* and *pair_style hybrid/overlay* commands, **without modifying or recompiling LAMMPS**, and how to build the required potential files.

The two-band energy expression

In a two-band model the energy of atom i is

$$E_i = \frac{1}{2} \sum_{j \neq i} V(r_{ij}) + F^d(\rho_i^d) + F^s(\rho_i^s), \quad \rho_i^d = \sum_{j \neq i} \phi^d(r_{ij}), \quad \rho_i^s = \sum_{j \neq i} \phi^s(r_{ij}).$$

This is an ordinary EAM (pair term V , d-band density ϕ^d , d-band embedding F^d) plus one *extra* embedding term F^s acting on a second, independent density ρ^s . Grouping the terms,

$$E_i = \underbrace{\left[\frac{1}{2} \sum_j V + F^d(\rho^d) \right]}_{\text{a standard eam/fs}} + \underbrace{[F^s(\rho^s)]}_{\text{eam/fs with } V \equiv 0}$$

shows that the total energy is the sum of two EAM potentials. Adding energies, forces, and virials of two potentials acting on the same atoms is exactly what *pair_style hybrid/overlay* does.

Why the s-band file must be *eam/fs*

In the two-band models the second (s-band) density is non-zero only between *unlike* atoms; it vanishes between atoms of the same element (*Bonny*):

$$\phi_{AA}^s = \phi_{BB}^s = 0, \quad \phi_{AB}^s = \phi_{BA}^s \neq 0.$$

A density that depends on the element of *both* the source and the target atom can only be expressed in the Finnis-Sinclair form, i.e. with *pair_style eam/fs*, whose density functions $\rho_{\alpha\beta}(r)$ are indexed per element pair. It *cannot* be written as an *eam/alloy* potential, which has a single density per element summed over all neighbors. Therefore the s-band file is always an *eam/fs* file in which the like-element density functions are set to zero and only the unlike-element density is non-zero. Its pair-potential ($r \phi$) section is set entirely to zero, because the pair term belongs to the d-band file.

The d-band file is an ordinary binary EAM (the pair term plus the d-band density and embedding). Because its density depends only on the neighbor’s element it could equally be written as *eam/alloy*; using *eam/fs* for both files keeps the recipe uniform.

The recipe

```
pair_style hybrid/overlay eam/fs eam/fs
pair_coeff * * eam/fs 1 FeCr.dband.eam.fs Fe Cr # pair V + d-band  $F_d(\rho_d)$ 
pair_coeff * * eam/fs 2 FeCr.sband.eam.fs Fe Cr # s-band  $F_s(\rho_s)$ , no pair
```

The numeric 1 and 2 after `eam/fs` are required because the same sub-style is used twice; see [pair_hybrid](#). Each `eam/fs` instance keeps its own density and embedding-derivative arrays and performs its own communication, so the two densities ρ^d and ρ^s never mix. `hybrid/overlay` sums the two contributions, and because the s-band file has no pair term there is no double counting: the combined energy is exactly $\frac{1}{2} \sum V + F^d(\rho^d) + F^s(\rho^s)$.

The two files are independent `eam/fs` files and may use different radial grids and cutoffs; the neighbor list is built with the larger of the two cutoffs. Because both files store the same element masses, you may also set masses explicitly with the `mass` command to avoid any ambiguity.

This generalizes to more than two bands: overlay N `eam/fs` files to add N embedding terms. The same construction works for any model of the form “standard EAM plus one or more additive embedding terms.”

Building the s-band file

The helper script `tools/eam_generate/two_band_fecr.py` writes the s-band `eam/fs` file (cross-only density, F^s embedding, zero pair term) and can also emit an illustrative demo d-band file plus a ready-to-run input deck:

```
cd tools/eam_generate
# self-contained runnable demo (writes both files + a sample input):
./two_band_fecr.py --demo --prefix FeCr_demo

# real use: add an s-band to your own trusted Fe-Cr d-band eam/fs file:
./two_band_fecr.py --dband MyFeCr.eam.fs --preset olsson-vasp --prefix FeCr_2bm
```

The script implements the s-band density as the square of a 4s Slater function with a smooth cutoff and the s-band embedding as $F^s(\rho) = c_1\sqrt{\rho} + c_2\rho^2 + c_3\rho^4$, matching the forms used in the published models. It ships parameter presets taken from the literature, but note that the absolute normalization of ρ^s and the matching F^s coefficients are convention-sensitive: validate a preset against a known result (for instance the concentration dependence of the mixing enthalpy) before using it for production work. The default `--demo` parameters are self-consistent and illustrative only; they exercise the overlay mechanics but are not a published fit.

A worked check

Running the demo input produced by `--demo` and decomposing the energy with `compute pair` confirms the construction:

```
compute ed all pair eam/fs 1 epair # d-band sub-style energy
compute es all pair eam/fs 2 epair # s-band sub-style energy
thermo_style custom step pe c_ed c_es
```

The total potential energy is exactly `c_ed + c_es`. For a *pure* element the s-band energy `c_es` is identically zero, because the like-element s-density is zero, so $\rho^s = 0$ and $F^s(0) = 0$. Introducing unlike neighbors (an alloy) makes `c_es` non-zero: the s-band term samples the local concentration, which is the entire purpose of the model.

Restrictions and notes

- The s-band embedding of these models typically has a $\sqrt{\rho}$ term, whose slope diverges as $\rho \rightarrow 0$. This is harmless here: LAMMPS tabulates F^s as a spline (finite at every grid point) and the force contribution is multiplied by the s-density derivative, which is identically zero for like pairs. A pure-element atom therefore contributes no spurious s-band force.

- This Howto reproduces the two-band *functional form* exactly. Reproducing a specific published *parameterization* additionally requires the correct d-band/pair files (for Fe-Cr, the Mendelev iron potential plus the refit chromium and cross interactions) and validated s-band coefficients.

10.5 Packages howto

10.5.1 Finite-size spherical and aspherical particles

Typical MD models treat atoms or particles as point masses. Sometimes it is desirable to have a model with finite-size particles such as spheroids, ellipsoids, superellipsoids, or generalized aspherical bodies. The difference is that such particles have a moment of inertia, rotational energy, and angular momentum. Rotation is induced by torque coming from interactions with other particles.

LAMMPS has several options for running simulations with these kinds of particles. The following aspects are discussed in turn:

- atom styles
- pair potentials
- time integration
- computes, thermodynamics, and dump output
- rigid bodies composed of finite-size particles

Example input scripts for these kinds of models are in the `body`, `colloid`, `dipole`, `ellipse`, `line`, `peri`, `pour`, and `tri` directories of the *examples directory* in the LAMMPS distribution.

Atom styles

There are several *atom styles* that allow for definition of finite-size particles: `sphere`, `dipole`, `ellipsoid`, `line`, `tri`, `peri`, and `body`.

The *sphere* style defines particles that are spheroids and each particle can have a unique diameter and mass (or density). These particles store an angular velocity (ω) and can be acted upon by torque. The “set” command can be used to modify the diameter and mass of individual particles, after then are created.

The *dipole* style does not actually define finite-size particles, but is often used in conjunction with spherical particles, via a command like

```
atom_style hybrid sphere dipole
```

This is because when dipoles interact with each other, they induce torques, and a particle must be finite-size (i.e. have a moment of inertia) in order to respond and rotate. See the *atom_style dipole* command for details. The “set” command can be used to modify the orientation and length of the dipole moment of individual particles, after then are created.

The *ellipsoid* style defines particles that are ellipsoids or superellipsoids and thus can be aspherical. Each particle has a shape, specified by 3 diameters, and mass (or density). Superellipsoid particles can be defined by additionally specifying 2 blockiness exponents (`block`) and adding the *superellipsoid* keyword to the *atom_style ellipsoid* command.

These particles store an angular momentum and their orientation (quaternion), and can be acted upon by torque. They do not store an angular velocity (ω), which can be in a different direction than angular momentum, rather they compute it as needed. The *set command* can be used to modify the diameter, orientation, and mass of individual

particles, after they are created. The *set command* can also be used to modify the blockiness of superellipsoid particles. It also has a brief explanation of what quaternions are.

The *line* style defines line segment particles with two end points and a mass (or density). They can be used in 2d simulations, and they can be joined together to form rigid bodies which represent arbitrary polygons.

The *tri* style defines triangular particles with three corner points and a mass (or density). They can be used in 3d simulations, and they can be joined together to form rigid bodies which represent arbitrary particles with a triangulated surface.

The *peri* style is used with *Peridynamic models* and defines particles as having a volume, that is used internally in the *pair_style peri* potentials.

The *body* style allows for definition of particles which can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. The body style is discussed in more detail on the *Howto body* doc page.

Note that if one of these atom styles is used (or multiple styles via the *atom_style hybrid* command), not all particles in the system are required to be finite-size or aspherical.

For example, in the ellipsoid style, if the 3 shape parameters are set to the same value, the particle will be a sphere rather than an ellipsoid. If the 3 shape parameters are all set to 0.0 or if the diameter is set to 0.0, it will be a point particle. In the line or tri style, if the lineflag or triflag is specified as 0, then it will be a point particle. Similarly, if a superellipsoid has both blockiness parameters set to 1.0, the superellipsoid will be a regular ellipsoid.

Some of the pair styles used to compute pairwise interactions between finite-size particles also compute the correct interaction with point particles as well, e.g. the interaction between a point particle and a finite-size particle or between two point particles. If necessary, *pair_style hybrid* can be used to ensure the correct interactions are computed for the appropriate style of interactions. Likewise, using groups to partition particles (ellipsoids versus spheres versus point particles) will allow you to use the appropriate time integrators and temperature computations for each class of particles. See the doc pages for various commands for details.

Also note that for *2d simulations*, atom styles sphere and ellipsoid still use 3d particles, rather than as circular disks or ellipses. This means they have the same moment of inertia as the 3d object. When temperature is computed, the correct degrees of freedom are used for rotation in a 2d versus 3d system.

Pair potentials

When a system with finite-size particles is defined, the particles will only rotate and experience torque if the force field computes such interactions. These are the various *pair styles* that generate torque:

- *pair_style granular*
- *pair_style gran/hooke*
- *pair_style gran/hooke/history*
- *pair_style gran/hertz/history*
- *pair_style granular/superellipsoid*
- *pair_style dipole/cut*
- *pair_style gayberne*
- *pair_style resquared*
- *pair_style brownian*
- *pair_style lubricate*
- *pair_style line/lj*
- *pair_style tri/lj*

- *pair_style body/nparticle*

Most of the granular pair styles are used with spherical particles with the exception of the *granular/superellipsoid* pair style which is used with superellipsoid particles. The dipole pair style is used with the dipole atom style, which could be applied to spherical or ellipsoidal particles. The GayBerne and RESquared potentials require ellipsoidal particles, though they will also work if the 3 shape parameters are the same (a sphere). The Brownian and lubrication potentials are used with spherical particles. The line, tri, and body potentials are used with line segment, triangular, and body particles respectively.

Time integration

There are several fixes that perform time integration on finite-size spherical particles, meaning the integrators update the rotational orientation and angular velocity or angular momentum of the particles:

- *fix nve/sphere*
- *fix nvt/sphere*
- *fix npt/sphere*

Likewise, there are 3 fixes that perform time integration on ellipsoidal particles:

- *fix nve/asphere*
- *fix nvt/asphere*
- *fix npt/asphere*

The advantage of these fixes is that those which thermostat the particles include the rotational degrees of freedom in the temperature calculation and thermostating. The *fix langevin* command can also be used with its *omega* or *angmom* options to thermostat the rotational degrees of freedom for spherical or ellipsoidal particles. Other thermostating fixes only operate on the translational kinetic energy of finite-size particles.

These fixes perform constant NVE time integration on line segment, triangular, and body particles:

- *fix nve/line*
- *fix nve/tri*
- *fix nve/body*

Note that for mixtures of point and finite-size particles, these integration fixes can only be used with *groups* which contain finite-size particles.

Computes, thermodynamics, and dump output

There are several computes that calculate the temperature or rotational energy of spherical or ellipsoidal particles:

- *compute temp/sphere*
- *compute temp/asphere*
- *compute erotate/sphere*
- *compute erotate/asphere*

These include rotational degrees of freedom in their computation. If you wish the thermodynamic output of temperature or pressure to use one of these computes (e.g. for a system entirely composed of finite-size particles), then the compute can be defined and the *thermo_modify* command used. Note that by default thermodynamic quantities will be calculated with a temperature that only includes translational degrees of freedom. See the *thermo_style* command for details.

These commands can be used to output various attributes of finite-size particles:

- *dump custom*
- *compute property/atom*

- *dump local*
- *compute body/local*

Attributes include the dipole moment, the angular velocity, the angular momentum, the quaternion, the torque, the end-point and corner-point coordinates (for line and tri particles), and sub-particle attributes of body particles.

Rigid bodies composed of finite-size particles

The *fix rigid* command treats a collection of particles as a rigid body, computes its inertia tensor, sums the total force and torque on the rigid body each timestep due to forces on its constituent particles, and integrates the motion of the rigid body.

If any of the constituent particles of a rigid body are finite-size particles (spheres or ellipsoids or line segments or triangles), then their contribution to the inertia tensor of the body is different than if they were point particles. This means the rotational dynamics of the rigid body will be different. Thus a model of a dimer is different if the dimer consists of two point masses versus two spheroids, even if the two particles have the same mass. Finite-size particles that experience torque due to their interaction with other particles will also impart that torque to a rigid body they are part of.

See the “fix rigid” command for example of complex rigid-body models it is possible to define in LAMMPS.

Note that the *fix shake* command can also be used to treat 2, 3, or 4 particles as a rigid body, but it always assumes the particles are point masses.

Also note that body particles cannot be modeled with the *fix rigid* command. Body particles are treated by LAMMPS as single particles, though they can store an internal state, such as a list of sub-particles. Individual body particles are typically treated as rigid bodies, and their motion integrated with a command like *fix nve/body*. Interactions between pairs of body particles are computed via a command like *pair_style body/nparticle*.

10.5.2 Granular models

Granular systems are composed of finite-size spherical or aspherical particles with explicit diameters, as opposed to point particles. This means they have an angular velocity and torque can be imparted to them to cause them to rotate.

The various atom, pair, fix, and compute styles listed below on this page are useful for creating granular models with such particles.

You can also define granular “surfaces” which are a collection of line segments (2d systems) or triangles (3d systems), which act as boundaries interacting with the particles. This is particularly useful for defining a complex wall or boundary geometry. Particle/surface interactions can be specified with similar options as the pair styles listed below for particle/particle interactions.

These doc pages describe how to define and use granular surfaces:

- *Howto granular surfaces*
- *fix surface/global*
- *fix surface/local*
- *pair_style surf/granular*

To run a simulation of particles with a granular model, you will typically want to use the following commands:

- *atom_style sphere*
- *fix nve/sphere*
- *fix gravity*

Aspherical granular particles can be simulated by creating clusters of spherical particles using either the *rigid* or *BPM* package or by using *superellipsoids*.

This compute

- *compute erotate/sphere*

calculates rotational kinetic energy which can be *output with thermodynamic info*.

The compute

- *compute fabric*

calculates various versions of the fabric tensor for granular and non-granular pair styles.

Use one of these 4 pair potentials, which compute forces and torques between interacting pairs of particles:

- *pair_style gran/history*
- *pair_style gran/no_history*
- *pair_style gran/hertzian*
- *pair_style granular*

The first 3 are the older, original granular pair styles implemented in LAMMPS. The 4th *pair_style gran/no_history* is the newest and most flexible. It's pairwise interaction models include options similar to the first 3 pair styles, plus many additional models.

To add your own custom granular contact model to the *pair_style granular* command, see the *Modifying granular sub-models* doc page.

These commands implement fix options specific to granular systems:

- *fix freeze*
- *fix pour*
- *fix viscous*
- *fix wall/gran*
- *fix wall/gran/region*

The fix style *freeze* zeroes both the force and torque of frozen atoms, and should be used for granular systems instead of the fix style *setforce*.

To model heat conduction, one must add the temperature and heatflow atom variables with:

- *fix property/atom*

plus a temperature integration fix

- *fix heat/flow*

and a heat conduction option defined in both these commands:

- *pair_style granular*
- *fix wall/gran*

For computational efficiency, you can eliminate needless pairwise computations between frozen atoms by using this command:

- *neigh_modify* exclude

Note

By default, for 2d systems, granular particles are still modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be the same as in 3d. If you wish to model granular particles in 2d as 2d discs, see the note on this topic on the [Howto 2d](#) doc page, where 2d simulations are discussed.

10.5.3 Granular surfaces

Added in version 4Jul2026.

As explained on the [Howto granular](#) doc page, granular systems are composed of finite-size spherical or aspherical particles with explicit diameters, as opposed to point particles. This means they have an angular velocity and torque can be imparted to them to cause them to rotate.

The [Howto granular](#) doc page lists various atom, pair, fix, and compute styles useful for creating granular models with such particles.

This page explains how you can also define granular surfaces which are a collection of triangles (3d systems) or line segments (2d systems), which act as boundaries interacting with the particles. This is particularly useful for defining a complex wall or boundary geometry. As described below, particle/surface interactions can be specified with similar options as those for particle/particle interactions.

In the examples directory, several examples of these boundaries are found in the `gransurf` folder. In particular, this includes a screw feeder geometry where a cylindrical container is being fed a stream of granular particles from above which are conveyed forward using a rotating screw. An illustration is rendered in the below figure using the [dump image](#) command.

Furthermore, as another illustration of possible applications, an image is included of a complex geometry based on the actual shape of the Itokawa asteroid. Here, a surface is used to create a container which is filled by a poly-disperse granular packing.

Global versus local surfaces

A key point to understand is that LAMMPS supports two forms of granular surfaces. You cannot use both in the same simulation.

The first is *global* which means that each processor stores a copy of all the triangles/lines. This is suitable when only a modest number of triangles/lines is needed. They can be large triangles/lines, any of which span a significant fraction of the simulation box size in one or more dimensions.

The second is *local* which means that the collection of triangles/lines is distributed across processors in the same manner that particles are distributed. Each processor is assigned to a sub-domain of the simulation box and owns whichever triangles/lines have their center point in the processor's sub-domain. Similar to particles, each processor may also own ghost copies of triangles/lines whose finite size overlaps with the processor's sub-domain. The total number of triangles/lines in the system can now be very large. For effective distribution and minimal communication, all the triangles/lines should be small, no more than a few particle diameters in size. If even one larger triangle or line is

defined then the neighbor list cutoff and communication cutoff will be set correspondingly larger, which can slow down the simulation. Note that a large triangle or line can instead be defined as multiple connected smaller triangles or lines without changing the topology of the collective surface. The *multi neighbor* option may be useful, however, in such scenarios.

One of these two commands must be specified to use *global* or *local* surfaces in your granular simulation:

- *fix surface/global*
- *fix surface/local*

The *fix surface/global* command reads in the global surfaces in one of two ways. The first option is from a molecule file(s) previously defined by the *molecule* command. The file should define triangles or lines with header keywords and a Triangles or Lines section. The second option is from a text or binary STL (stereolithography) file which defines a set of triangles. It can only be used with 3d simulations.

The *fix surface/local* command defines local surface in one of three ways. The first two options are the same molecule and STL files explained in the previous paragraph. In this case, the list of triangles/lines is distributed across processors based on the center point of each triangle/line. The third option is to include them in a LAMMPS data file which has been previously read in via the *read_data* command. If the file has a Triangles or Lines section, then triangles/lines will be read in and distributed along with any particles the data file includes, assuming an appropriate *atom_style* has been specified, as explained below.

Surface attributes

For both global and local surfaces, each triangle/line is assigned a *type* and a *molecule ID*. This is done when surfaces are read-in from a molecule, STL, or data file. Since STL files do not define types or molecule IDs, the *fix surface/global* and *fix surface/local* commands specify the type and molecule ID that will be assigned to the read-in triangles. The *fix surface/global* command also allows use of the *fix_modify type/region* command to assign types based on a geometric region. Since local surfaces are effectively particles, the *set* command can be used to alter the *type* or *molecule ID* of any triangle or line.

For both global and local surfaces, types are used to define the style of granular interactions for individual triangles/lines. Different types, and thus styles, can be used within a single object consisting of connected triangles/lines.

Molecule IDs can be used to limit which triangles/lines are considered to be “connected”. They are therefore intended to be assigned uniquely to each inter-connected set of triangles/lines, as if each object were a “molecule”. See the Surface Connectivity section below.

For local surfaces, the molecule ID can be used to define groups which enables assignment of different motions to different surface objects. See the Surface Motion section below. Various other LAMMPS commands operate on groups or molecules and can thus be used to gather statistics about or output information about individual surface objects.

Atom styles for granular surfaces

For all three ways of defining *local* surfaces, the triangles/lines are stored internally in LAMMPS as triangle-style or line-style particles. This means you must use a hybrid atom style which includes one of these two sub-styles (for 3d or 2d):

- *atom_style tri* for 3d simulations
- *atom_style line* for 2d simulations

The *atom_style* hybrid command must also define a *atom_style sphere* sub-style for the granular particles which interact with the surfaces.

Note that for molecule or STL file input, the *fix surface/local* command reads the file(s) and uses the values for each surface to create a single new triangle or line particle. For data file input, the triangle/line particles are created when the data file is read.

For granular simulations with *global* surfaces, a hybrid atom style which defines triangle-style or line-style particles should NOT be used. Typically only an *atom_style sphere* command is needed to define the properties of particles in the simulation. The triangles/lines are stored by the *fix surface/global* command and not as triangle-style or line-style particles.

Rules for surface topology

For both *global* and *local* surfaces, granular particles interact with both sides of each triangle or line segment. This means a surface such as a mixer blade can be infinitely thin.

Triangles and line segments are considered to be “connected” and form a contiguous surface, if they (1) have the same molecule ID and (2) share common edges or corner point (triangles) or end points (line segments). Each triangle edge or corner point can be shared by multiple adjacent triangles. A triangle edge is shared by two triangles if both the end points of the edge are corner points of both triangles. A triangle corner point is shared by two triangles if it is a corner point of both. Likewise a line segment end point is shared by two line segments if it is an end point of both segments.

There is no requirement that a triangle edge or triangle corner point or line segment end point be connected to another triangle or line segment. If an edge or point has no connection, it is a free (unconnected) edge or point. Particles interact with the free edge or corner point in a manner consistent with forces generated by particles overlapping with the interior of a triangle or line segment.

No check is made to see if two triangles or line segments intersect each other; this is allowed if it makes sense for the geometry of the collection of surfaces. However, intersections can cause issues if the missing connectivity leads to inaccurate forces.

As an example of a valid intersection, consider a 2d simulation which mixes a container of granular particles. *Global* line segments are used to define both the box-shaped container and the mixer in the center. The 4 mixer blades are in the shape of a large X and are made to rotate using the *fix_modify* command (see below).

The 2 blades could be defined by 2 line segments which cross each other at their centers (left). Or the 2 blades could be defined by 4 line segments, all of which have a common endpoint at the center of the mixer (middle). Or the 2 blades could be defined by

4 non-touching line segments, all of which have a distinct endpoint near the center of the mixer, but displaced from it by a distance less than the radius of a granular particle (right). In any of these cases, when a particle gets very close to the center of the mixer it will interact with both nearby line segments as expected.

As an example of an invalid intersection, consider a 2d simulation of a T shaped object (next figure, left) defined by only 2 line segments (red, blue). The vertical line segment (blue) ends at the midpoint of the horizontal line segment (red). Without proper connectivity, there is no way to censor a force from the geometrically hidden vertical segment as a particle (gray) moves horizontally across the top of the T. In contrast, the same T shape can be defined in a valid manner (right) by using 3 line segments (red, green, blue) which all share a common endpoint at the center of the top of the T. The connectivity will then correctly censor the force from the vertical segment (blue).

See the next section on connectivity for how two triangles or line segments are treated if they share a common edge (triangle) or point (triangle or line).

Surface connectivity

If multiple triangles/lines are used to define a contiguous surface which is flat or gently curved or has sharp edges or corners, LAMMPS will detect when two or more line segments (2d) in the same molecule share the same end-point. Or when two or more triangles (3d) in the same molecule share the same edge or same corner point.

This connectivity is stored internally and is used when appropriate to calculate accurate forces on particles which simultaneously overlap with 2 or more connected triangles or line segments.

Consider the simulation model of the previous section for a 2d mixer now defined by *local* line segments. The flat surface of each mixer blade (and container box faces) is defined by multiple small line segments. It is important that these line segments be “connected” so that when a particle contacts two adjacent line segments at the same time, the resulting force on the particle is the same as it would be if it were contacting the middle of a single long line segment.

Here is how to ensure that LAMMPS detects the appropriate connections.

For either *global* or *local* surfaces, if the triangles/lines are defined in a molecule or STL file, then 3 corner points (triangle) or 2 end points (line) will be listed for each triangle/line in the file. LAMMPS will only make a connection between 2 triangles or lines if a shared point is EXACTLY the same in both. This is a single point in both for a corner point or end point connection. It is two points in both triangles for an edge connection.

For *local* surfaces, if the triangles/lines are defined in a data file, then 3 corner points (triangle) or 2 end points (line) will be listed for each triangle/line in the file. However in this case, LAMMPS will allow for an INEXACT match of a shared point to make a connection between 2 triangles or lines. Again, this is a single point in both for a corner point or end point connection. It is two points in both triangles for an edge connection.

An INEXACT match means that the two points can be EPSILON apart. EPSILON is defined as a tiny fraction ($1.0\text{e-}4$) of the size of the smallest triangle or line in the system. The reason INEXACT matches are allowed is that data files can be created in a variety of manners, including by LAMMPS itself as a simulation runs via the [write_data](#) command. Internally, triangle-style and line-style particles do not store their corner points directly. Instead, the center point of the triangle/line is stored, along with an orientation of the triangle/line and a displacement vector from the center point for each corner point. This means that when new corner points values are written to a data file for two different triangles/line, they may differ slightly due to round-offs in finite-precision arithmetic.

Note that due to how connectivity is defined, two triangles/lines will not be connected if their corner points are separated by small distances (greater than EPSILON, but still small). Likewise they will not be connected if the corner point of one triangle/line is very close to (or even on) the surface of another triangle or middle of another line segment. In general these kinds of granular surfaces could be problematic and should be avoided, but LAMMPS does not check for these conditions.

In addition, note that connectivity is only defined between two triangles/lines with the same molecule ID. This way surfaces of two molecules can move independently, as described in the following section.

Note that if a triangle or line segment has a free edge or free corner/end point (not connected to any other triangle/line), granular particles will still interact with the triangle/line if the nearest contact point to the spherical particle center is on the free edge or is the free corner/end point.

Surface motion

By default, surface triangles/lines are motionless during a simulation, whether they are *global* or *local*. Triangles/lines impart forces and torques to granular particles, but the inverse forces/torques on the triangles/lines do not cause them to move.

However, triangles/lines can be made to move in a prescribed manner. E.g. the rotation of 2d mixer blades in the example described above. These two commands can be used for that purpose:

- `fix_modify move` for *global* surfaces
- `fix move` for *local* surfaces

For *global* surfaces, the `fix_modify move` command can move a specified subset of the triangles/lines in various ways (translation, rotation, etc). Which triangles move is specified based on the *molecule ID* of each triangle. Molecule IDs are specified when surfaces are defined by the `fix surface/global` command. They can also be defined by the `fix_modify mol/region` command.

For *local* surfaces, the `fix move` command can move a specified subset of the triangles/lines in various ways (translation, rotation, etc). Which triangles move is specified based on the group-ID argument to the `fix move` command. Groups of *local* surfaces can be defined by the `group` command.

Note

For an object defined by two or more connected triangles/lines, it is an error to assign a motion and not include all the connected triangles/lines, since this would break the connections. LAMMPS checks this for *global* surfaces but only checks that the `fix` group of any instances of `fix move` include all or none of a set of connected *local* triangles/lines.

Calculation of forces

After generating the surface connectivity, LAMMPS classifies each connection as being flat or non-flat based on the angular difference between normal vectors. The two sides are then classified as being concave or convex based on their normal vectors. In scenarios where flat surfaces are perfectly flat (parallel normal vectors) the concave vs convex designation is arbitrary.

Each point or edge of a line or triangle is then classified as being internal, external, or unconnected based on the connectivity. For lines, an end point is internal if it only has flat connections, external if it has at least one non-flat (concave or convex) connection, and unconnected if it has no connections. The same is true for edges on a triangle. Corners on triangles inherit their classification from the two edges that meet at it. If either edge is unconnected, the corner is unconnected. Otherwise, the corner is external if either edge is external, and internal if both edges are internal.

To calculate force on a particle, LAMMPS finds a set of all lines or triangles that are geometrically in contact with the particle, S_{all} . For each line or triangle i , LAMMPS calculates the geometric overlap δ_i and the normal vector between the contact point on that line/triangle and the particle, $\hat{n}_{r,i}$.

Depending on the contact model, the force between a particle and a surface can depend on many variables including relative velocities, angular velocities, sliding history, etc. Most importantly, the force depends on an effective overlap distance δ_f and an effective point of contact $\vec{r}_c$ or (equivalently) the direction of the normal force $\hat{n}_f$. If a particle is in contact with a single line or triangle i , there is an unambiguous geometrically-determined point of contact and overlap such that $\delta_f = \delta_i$ and $\hat{n}_f = \hat{n}_{r,i}$. If a particle is in contact with two (or more) lines/triangles that are not connected, then two forces are applied with overlaps and directions determined from the geometric values for each line/triangle. However, if the particle is in contact with two (or more) connected lines/triangles, the calculation of δ_f and $\hat{n}_f$ is more complicated and is described in the remainder of this section.

First, LAMMPS needs to identify a set of consistent sides of contact for each line/triangle in S_{all} . For a single line or triangle, which side or face of the surface is in contact is unambiguous. However, if a particle is in contact with two or more connected lines/triangles this depends on the network of connectivity. For instance, the below figure highlights a 2D system with a particle (gray circle) in contact with two (green) lines that are part of a rhombus shaped object. From a naive local determination, one would determine the particle is in contact with the sides/faces of the two lines with each surface normal oriented in the blue direction, one of which points inwards, into the object. However, through the context of the convex connection, one can identify the physical (correct) surface normals (red). LAMMPS evaluates a consistent set of sides/faces (setting the sign of $\hat{n}_s$) by walking through all connections of contacted surfaces starting from the primary contact. If there are still unchecked surfaces, LAMMPS finds the unchecked surface with the largest overlap and repeats the process.

Next, LAMMPS clusters all contacted and connected lines/triangles into distinct composite sets each consisting of mutually flat line/triangle surfaces that act as one physical object, denoted S_n where n labels a particular composite. For instance, if a particle is touching two flat-connected surfaces and a third concave-connected surface, it will group them into two composite surfaces of size two and one. Each composite set of surfaces calculates an effective contact point and applies a single force on the particle. This clustering is performed by starting with the primary contact and checking all of its connections. Flat connections are added to the current set of surfaces S_n and to a list of surfaces which need to be walked. Non-flat connections are skipped, however, convex connections with smaller overlaps are first flagged to be hidden (described below). LAMMPS then iterates one-by-one through the list of surfaces to be walked until it is empty. This effectively searches all 1st flat neighbors of the primary contact, then flat 2nd neighbors, etc. LAMMPS then identifies the next unprocessed surface with the largest overlap (the new primary contact) and repeats the process to create a new set of composite surfaces S_m and continues until all contacting surfaces in S_{all} have been added to a composite set (which can consist of single surface). While performing this walk, any hidden flags are passed along to subsequently walked flat connecting surfaces such that the hidden status cascades around a convex turn.

For each composite set of flat surfaces S_n , LAMMPS calculates a single force from an effective net overlap δ_f and direction $\hat{n}_f$. Before calculating δ_f , the individual overlap of any hidden surface i is zeroed, $\delta_i = 0$. Then $\delta_f = \max(\delta_i | i \in S_n)$. The direction of the force is a weighted average across all surfaces in the set S_n or $\hat{n}_f = A \sum W_i \delta_i \hat{n}_{f,i}$ where $\hat{n}_{f,i}$ is a calculated direction of force for that surface, W_i is a per-surface weight, and A is a normalization factor.

Before describing the calculation of individual directions, $\hat{n}_{f,i}$, and weights, W_i , for surfaces in a composite, LAMMPS calculates a general weight for externally vs. internally contacted surfaces defined as $W_{\text{ext}} \equiv (\delta_{\text{max,ext}}/\delta_{\text{max}})^2$ and $W_{\text{int}} \equiv 1 - W_{\text{ext}}$, respectively, where $\delta_{\text{max,ext}}$ is the maximum overlap with an externally contacted surface in that composite set S_n . This weighting is used to emphasize contributions from surfaces on a convex boundary as a particle moves along the convex turn.

In 2D, a surface i 's weight W_i is either W_{ext} or W_{int} based on its status. By default, $\hat{n}_{f,i}$ is simply the direction from the local contact point on that surface to the particle, $\hat{n}_{r,i}$. For example, if the contact point is inside of the line, then $\hat{n}_{r,i}$ is equivalent to the surface normal $\hat{n}_{s,i}$. However, there are two exceptions: (a) if the contact is at a concave-connected point then $\hat{n}_{f,i} = \hat{n}_{s,i}$, and (b) if the contact is at a convex-connected point and $\hat{n}_{r,i}$ has a component pointing into the neighboring line vector indexed j then $\hat{n}_{f,i} = \hat{n}_{s,j}$. These rules place limits on how much a resulting force can point into the connected line j to ensure $\hat{n}_{f,i}$ smoothly varies as the particle turns the bend. A few details are worth noting. First, as non-flat connecting surfaces are hidden behind convex turns ($\delta_i = 0$), the limit in the convex scenario is only relevant for connections that are both flat and convex. Secondly, if two flat lines are perfectly parallel, then $\hat{n}_{f,i} = \hat{n}_{s,i} = \hat{n}_{s,j}$ implying the concave/convex designation has no effect. Lastly, if a point is shared by more than two lines, then LAMMPS finds which connecting line has a normal vector closest to $\hat{n}_{s,i}$ to determining whether it's a concave or convex connection.

To illustrate, two scenarios are visualized in the figure below. In the left panel, a particle at various positions (red, green, blue, and purple) contacts a concave bend made up of two lines (coral brown). Here the leftmost line is labeled i and the rightmost line is labeled j . The direction of the force $\hat{n}_{f,i}$ from line i is indicated by arrows. Along the entire

contact, $\hat{n}_{f,i} = \hat{n}_{s,i}$. In the right panel, the contact point is at a convex corner such that $\hat{n}_{f,i} = \hat{n}_{r,i}$ (red, green) unless $\hat{n}_{r,i}$ has a component pointing into the adjacent line j , in which case $\hat{n}_{f,i} = \hat{n}_{s,j}$ (blue, purple). These rules therefore simply enforce sensible continuity of forces as atoms move across line segments.

In 3D, first consider a scenario where there are no contacts with free or unconnected edges (all edges have at least one connection). Again, each composite set of surfaces S_n calculates a single force. For each surface, if its contact point is inside of the triangle, then $\hat{n}_{f,i} = \hat{n}_{s,i}$. If the contact is on an edge, it acts much like a point in 2D: a concave connection implies $\hat{n}_{f,i} = \hat{n}_{s,i}$ and a convex connection implies $\hat{n}_{f,i} = \hat{n}_{r,i}$ unless $\hat{n}_{r,i}$ points into the adjacent triangle j in which case $\hat{n}_{f,i} = \hat{n}_{s,j}$. This is determined by comparing the three dot products between $\hat{n}_{s,i}$, $\hat{n}_{s,j}$, and $\hat{n}_{r,i}$.

If a particle contacts a corner, then the corner first calculates what the direction of $\hat{n}_{f,i}$ would be had the particle contacted either of the two edges, labeled a and b , $\hat{n}_{f,a}$ and $\hat{n}_{f,b}$ (where the i is implied from context). Let us denote the normalized line vectors of these edges as $\hat{l}_a$ and $\hat{l}_b$, where the orientation is chosen to point towards the corner in consideration.

If $\hat{n}_{f,a} \cdot \hat{l}_b < 0$ (or if the force from that edge has a component pointing into the other edge), then $\hat{n}_{f,a}$ is replaced with $\hat{n}_{s,i}$, and vice versa for edge b , to avoid forces pointing into the triangle. A resulting $\hat{n}_{f,i}$ is then calculated by performing a weighted average of these two edge contributions such that the result interpolates between the two limits as a particle moves from contacting one edge to the corner to the other edge.

The calculation of these two edge weights is complicated, but a brief description is provided below to contextualize the code. Each weight is primarily a function of several dot products including $C_a = \hat{n}_{r,i} \cdot \hat{l}_a$ and $D_a = \hat{n}_{r,i}^p \cdot \hat{l}_a$ as well as equivalents for edge b where $\hat{n}_{r,i}^p$ is $\hat{n}_{r,i}$ projected into the plane of the triangle. If the contact is directly above the corner such that $\hat{n}_{r,i}$ is parallel to $\hat{n}_{s,i}$, then $\hat{n}_{f,i}$ is simply set to $\hat{n}_{s,i}$ and this procedure is skipped. The base weights are then $W_a = (1 - C_a)D_b$ and $W_b = (1 - C_b)D_a$. This construction ensures the weight for, say, edge a approaches zero as $\hat{n}_{r,i}$ either aligns with $\hat{l}_a$ (at which point the edge cannot easily calculate a realistic force) or becomes perpendicular to $\hat{l}_b$ such that its contribution dominates.

When evaluating corner contacts, if either of the two edges, say a , has a convex connection and is hiding another triangle, an additional weight is required for that edge to ensure $\hat{n}_{f,i}$ continuously transitions as the particle moves across that convex turn to surface j . This is calculated in terms of the dot product $E_a = \hat{n}_{r,i}^a \cdot (\delta_{s,i} + \delta_{s,j})/2$ where $\hat{n}_{r,i}^a$ is the vector $\hat{n}_{r,i}$ minus any component along $\hat{l}_a$. W_b is then multiplied by $(1 - E_a)$, which goes to zero as the particle approaches the threshold before switching to contacting surface j which shares edge a .

Lastly, there are forces on particles from unconnected (free) edges or corners of triangles. For example, if one defines a circular plate made up of triangles, such unconnected edges make up the perimeter of the plate. Currently, LAMMPS does not calculate or store connectivity information between unconnected edges along such a border and therefore forces are not guaranteed to vary in a physically realistic manner as a particle moves along it (e.g. if there is a convex bend in the border, forces are not censored from the far edge as particles move around it). With this constraint, the below calculation is designed to prioritize continuity in the direction of force and ensure forces always point away from the surface's border as expected. However, it is generally recommended that if a surface has an exposed border, it should be designed to be relatively simple and smooth.

First assume there is only one contacted triangle in a composite set. Forces from edges are calculated identically to a convex-connected edge. Unconnected corners (those that have at least one unconnected edge) also average contributions from their two edges. If both edges are connected (or unconnected), this average is the same. However, if one is connected and the other is unconnected then the contribution from the connected edge, say a , is modified.

For interpolating between unconnected and connected limits, a general weighting $W_c = \max(0.0, 1.0 - dr_{uc}/\delta_{\max})$ is used where dr_{uc} is the maximum in-plane distance away from a triangle's unconnected corner or edge in the composite set. If the particle sits on top of the effective surface from the set, this weight is zero. As the particle moves off of and away from this effective surface, the weight approaches one. W_i for all surfaces that are not contacted on an unconnected

feature is then multiplied by W_c . Additionally, these surfaces multiply W_i by a factor of $W_{ip} = \min(1.0, \hat{n}_{s,i} \cdot \hat{n}_{r,i} / (1 - W_c))$. This term goes to zero as the particle moves within the plane of the surface, which practically should only happen when a particle is outside and away from the surface. This term avoids complications when internal connections cannot determine which side of the surface is being contacted.

Lastly, when contacting an unconnected corner which has one unconnected edge and one connected edge, the contribution from the connected edge is multiplied by these two factors, W_c and W_{ip} .

Recommendations for geometries

When designing geometries for granular surfaces, there are several things to keep in mind to avoid unintended force contributions and to improve efficiency.

While convex corners are identified and used to censor forces from physically hidden sections of a wall, if a particle is not in contact with the entirety of a convex turn, then forces cannot be properly censored. For example, consider a 2d system with a U shaped wall defined by 3 line segments (see figure). If the width of the U is wider than the typical particle-wall overlap (left), no issues are anticipated. However, if the width of the U is very thin relative to the typical particle-wall overlap (middle, right), then a particle could potentially be in contact with both vertical legs of the U. If the particle is also in contact with the base of the U (middle, green), then it can identify the convex turn and censor forces from the rightmost vertical leg (blue). However, if the particle is towards the top of the U (right) and not in contact with the base (green), then there is no way for the particle to identify the convex turn and censor forces from the far vertical wall (blue). Therefore, walls with very thin features separated by a gap less than the expected overlap distance between a particle and a surface can lead to unintended additional forces.

As mentioned in the above section, forces resulting from contact with unconnected endpoints of lines do point in the expected direction and experience no discontinuities as the particle moves around the endpoint. However, in 3D, contacts with unconnected edges only produce reasonably directed forces oriented away from the edge. However, the exact direction of a force can wobble as the contact moves across a series of disconnected edges and convex turns may not be appropriately censored. Therefore, it is recommended to avoid complex geometries along unconnected boundaries such as rapid oscillations in- or out-of-plane such as pleats or sawteeth, relative to the length of an edge.

To build a neighbor list between particles and lines/triangles, LAMMPS assigns a radius to each line/triangle that corresponds to the radius of the circle/sphere that encloses the object. Therefore, one must be aware that systems with large disparities between triangle/line and particle radii may slow down the neighbor list build, and could benefit from using the *the multi neighbor style* command for *local* surfaces. Furthermore, triangles with very high aspect ratios should generally be avoided as they can lead to large neighbor lists containing many particles which are not actually close to being contact with the triangle (false positives).

Example scripts

The `examples/gransurf` directory has example input scripts which use both *global* and *local* surfaces. Both 2d and 3d models are included.

Each script produces a series of snapshot images using the *dump image* command. The snapshots visualize both the particles and granular surfaces. The snapshots can be animated to view a movie of the simulation.

10.5.4 Body particles

Overview:

In LAMMPS, body particles are generalized finite-size particles. Individual body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. Note that other kinds of finite-size spherical and aspherical particles are also supported by LAMMPS, such as spheres, ellipsoids, line segments, and triangles, but they are simpler entities than body particles. See the [Howto spherical](#) page for a general overview of all these particle types.

Body particles are used via the `atom_style body` command. It takes a body style as an argument. The current body styles supported by LAMMPS are as follows. The name in the first column is used as the `bstyle` argument for the `atom_style body` command.

<code>nparticle</code>	rigid body with N sub-particles
<code>rounded/polygon</code>	2d polygons with N vertices
<code>rounded/polyhedron</code>	3d polyhedra with N vertices, E edges and F faces

The body style determines what attributes are stored for each body and thus how they can be used to compute pairwise body/body or bond/non-body (point particle) interactions. More details of each style are described below.

More styles may be added in the future. See the [page on creating new body styles](#) for details on how to add a new body style to the code.

When to use body particles:

You should not use body particles to model a rigid body made of simpler particles (e.g. point, sphere, ellipsoid, line segment, triangular particles), if the interaction between pairs of rigid bodies is just the summation of pairwise interactions between the simpler particles. LAMMPS already supports this kind of model via the `fix rigid` command. Any of the numerous pair styles that compute interactions between simpler particles can be used. The `fix rigid` command time integrates the motion of the rigid bodies. All of the standard LAMMPS commands for thermostating, adding constraints, performing output, etc will operate as expected on the simple particles.

By contrast, when body particles are used, LAMMPS treats an entire body as a single particle for purposes of computing pairwise interactions, building neighbor lists, migrating particles between processors, output of particles to a dump file, etc. This means that interactions between pairs of bodies or between a body and non-body (point) particle need to be encoded in an appropriate pair style. If such a pair style were to mimic the `fix rigid` model, it would need to loop over the entire collection of interactions between pairs of simple particles within the two bodies, each time a single body/body interaction was computed.

Thus it only makes sense to use body particles and develop such a pair style, when particle/particle interactions are more complex than what the `fix rigid` command can already calculate. For example, consider particles with one or more of the following attributes:

- represented by a surface mesh
- represented by a collection of geometric entities (e.g. planes + spheres)
- deformable
- internal stress that induces fragmentation

For these models, the interaction between pairs of particles is likely to be more complex than the summation of simple pairwise interactions. An example is contact or frictional forces between particles with planar surfaces that interpenetrate. Likewise, the body particle may store internal state, such as a stress tensor used to compute a fracture criterion.

These are additional LAMMPS commands that can be used with body particles of different styles

<i>fix nve/body</i>	integrate motion of a body particle in NVE ensemble
<i>fix nvt/body</i>	ditto for NVT ensemble
<i>fix npt/body</i>	ditto for NPT ensemble
<i>fix nph/body</i>	ditto for NPH ensemble
<i>compute body/local</i>	store sub-particle attributes of a body particle
<i>compute temp/body</i>	compute temperature of body particles
<i>dump local</i>	output sub-particle attributes of a body particle
<i>dump image</i>	output body particle attributes as an image

The pair styles currently defined for use with specific body styles are listed in the sections below.

Note that for all the body styles, if the data file defines a general triclinic box, then the orientation of the body particle and its corresponding 6 moments of inertia and other orientation-dependent values should reflect the fact the body is defined within a general triclinic box with edge vectors **A**,****B****,****C****. LAMMPS will rotate the box to convert it to a restricted triclinic box. This operation will also rotate the orientation of the body particles. See the [Howto triclinic](#) doc page for more details. The sections below highlight the orientation-dependent values specific to each body style.

Specifics of body style *nparticle*:

The *nparticle* body style represents body particles as a rigid body with a variable number *N* of sub-particles. It is provided as a vanilla, prototypical example of a body particle, although as mentioned above, the *fix rigid* command already duplicates its functionality.

The `atom_style` body command for this body style takes two additional arguments:

```
atom_style body nparticle Nmin Nmax
Nmin = minimum # of sub-particles in any body in the system
Nmax = maximum # of sub-particles in any body in the system
```

The *Nmin* and *Nmax* arguments are used to bound the size of data structures used internally by each particle.

When the *read_data* command reads a data file for this body style, the following information must be provided for each entry in the *Bodies* section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
```

where $M = 6 + 3*N$, and *N* is the number of sub-particles in the body particle.

The integer line has a single value *N*. The floating point line(s) list 6 moments of inertia followed by the coordinates of the *N* sub-particles (*x1* to *zN*) as *3N* values. These values can be listed on as many lines as you wish; see the *read_data* command for more details.

The 6 moments of inertia (*ixx,iyy,izz,ixy,ixz,iyz*) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each sub-particle are specified as its *x,y,z* displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the *x,y,z* values in the *Atoms* section of the data file, as is the total mass of the body particle.

Note that if the data file defines a general triclinic simulation box, these sub-particle displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The *pair_style body/nparticle* command can be used with this body style to compute body/body and body/non-body interactions.

Specifics of body style rounded/polygon:

The *rounded/polygon* body style represents body particles as a 2d polygon with a variable number of N vertices. This style can only be used for 2d models; see the *dimension* command. See the *pair_style body/rounded/polygon* page for a diagram of two squares with rounded circles at the vertices. Special cases for $N = 1$ (circle) and $N = 2$ (rod with rounded ends) can also be specified.

One use of this body style is for 2d discrete element models, as described in *Fraige*.

Similar to body style *nparticle*, the *atom_style body* command for this body style takes two additional arguments:

```
atom_style body rounded/polygon Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The *Nmin* and *Nmax* arguments are used to bound the size of data structures used internally by each particle.

When the *read_data* command reads a data file for this body style, the following information must be provided for each body in the *Bodies* section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
diameter
```

where $M = 6 + 3*N + 1$, and N is the number of vertices in the body particle.

The integer line has a single value N . The floating point line(s) list 6 moments of inertia, followed by the coordinates of the N vertices ($x1$ to zN) as $3N$ values (with $z = 0.0$ for each), followed by a diameter value = the rounded diameter of the circle that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the *read_data* command for more details.

Note

It is important that the vertices for each polygonal body particle be listed in order around its perimeter, so that edges can be inferred. LAMMPS does not check that this is the case.

The 6 moments of inertia (*ixx,iyy,izz,ixy,ixz,iyz*) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file.

For example, the following information would specify a square particle whose edge length is $\sqrt{2}$ and rounded diameter is 1.0. The orientation of the square is aligned with the xy coordinate axes which is consistent with the 6 moments of inertia: *ixx iyy izz ixy ixz iyz = 1 1 4 0 0 0*. Note that only *Izz* matters in 2D simulations.

```
3 1 19
4
1 1 4 0 0 0
-0.7071 -0.7071 0
-0.7071 0.7071 0
0.7071 0.7071 0
0.7071 -0.7071 0
1.0
```

A rod in 2D, whose length is 4.0, mass 1.0, rounded at two ends by circles of diameter 0.5, is specified as follows:

```
1 1 13
2
1 1 1.33333 0 0 0
-2 0 0
2 0 0
0.5
```

A disk, whose diameter is 3.0, mass 1.0, is specified as follows:

```
1 1 10
1
1 1 4.5 0 0 0
0 0 0
3.0
```

Note that if the data file defines a general triclinic simulation box, these polygon vertex displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The `pair_style body/rounded/polygon` command can be used with this body style to compute body/body interactions. The `fix wall/body/polygon` command can be used with this body style to compute the interaction of body particles with a wall.

Specifics of body style rounded/polyhedron:

The `rounded/polyhedron` body style represents body particles as a 3d polyhedron with a variable number of N vertices, E edges and F faces. This style can only be used for 3d models; see the `boundary` command. See the “`pair_style body/rounded/polygon`” page for a diagram of a two 2d squares with rounded circles at the vertices. A 3d cube with rounded spheres at the 8 vertices and 12 rounded edges would be similar. Special cases for $N = 1$ (sphere) and $N = 2$ (rod with rounded ends) can also be specified.

This body style is for 3d discrete element models, as described in [Wang](#).

Similar to body style `rounded/polygon`, the `atom_style body` command for this body style takes two additional arguments:

```
atom_style body rounded/polyhedron Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The `Nmin` and `Nmax` arguments are used to bound the size of data structures used internally by each particle.

When the `read_data` command reads a data file for this body style, the following information must be provided for each entry in the *Bodies* section of the data file:

```

atom-ID 3 M
N E F
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
0 1
1 2
2 3
...
0 1 2 -1
0 2 3 -1
...
1 2 3 4
diameter

```

where $M = 6 + 3*N + 2*E + 4*F + 1$, and N is the number of vertices in the body particle, E = number of edges, F = number of faces. For $N = 1$ or 2 , the format is simpler. E and F are ignored and no edges or faces are listed, so that $M = 6 + 3*N + 1$.

The integer line has three values: number of vertices (N), number of edges (E) and number of faces (F). The floating point line(s) list 6 moments of inertia followed by the coordinates of the N vertices ($x1$ to zN) as $3N$ values, followed by $2E$ vertex indices corresponding to the end points of the E edges, then $4*F$ vertex indices defining F faces. The last value is the diameter value = the rounded diameter of the sphere that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the [read_data](#) command for more details.

Note that vertices are numbered from 0 to $N-1$ inclusive. The order of the 2 vertices in each edge does not matter. Faces can be triangles or quadrilaterals. In both cases 4 vertices must be specified. For a triangle the 4th vertex is -1. The 4 vertices within each triangle or quadrilateral face should be ordered by the right-hand rule so that the normal vector of the face points outwards from the center of mass. For polyhedron with faces with more than 4 vertices, you should split the complex face into multiple simple faces, each of which is a triangle or quadrilateral.

Note

If a face is a quadrilateral then its 4 vertices must be co-planar. LAMMPS does not check that this is the case. If you have a quad-face of a polyhedron that is not planar (e.g. a cube whose vertices have been randomly displaced), then you should represent the single quad face as two triangle faces instead.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file.

For example, the following information would specify a cubic particle whose edge length is 2.0 and rounded diameter is 0.5. The orientation of the cube is aligned with the xyz coordinate axes which is consistent with the 6 moments of inertia: $ixx iyy izz ixy ixz iyz = 0.667\ 0.667\ 0.667\ 0\ 0\ 0$.

```

1 3 79
8 12 6
0.667 0.667 0.667 0 0 0

A rod in 3D, whose length is 4.0, mass 1.0 and rounded at two ends by circles of diameter 0.5, is specified as follows:

```
1 3 13
2 1 1
0 1.33333 1.33333 0 0 0
-2 0 0
2 0 0
0.5
```

A sphere whose diameter is 3.0 and mass 1.0, is specified as follows:

```
1 3 10
1 1 1
0.9 0.9 0.9 0 0 0
0 0 0
3.0
```

The number of edges and faces for a rod or sphere must be listed, but is ignored.

Note that if the data file defines a general triclinic simulation box, these polyhedron vertex displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The *pair_style body/rounded/polyhedron* command can be used with this body style to compute body/body interactions. The *fix wall/body/polyhedron* command can be used with this body style to compute the interaction of body particles with a wall.

Output specifics for all body styles:

For the *compute body/local* and *dump local* commands, all 3 of the body styles described on this page produces one datum for each of the N vertices (of sub-particles) in a body particle. The datum has 3 values:

```
1 = x position of vertex (or sub-particle)
2 = y position of vertex
3 = z position of vertex
```

These values are the current position of the vertex within the simulation domain, not a displacement from the center-of-mass (COM) of the body particle itself. These values are calculated using the current COM and orientation of the body particle.

The *dump image* command and its *body* keyword can be used to render body particles.

For the *nparticle* body style, each body is drawn as a collection of spheres, one for each sub-particle. The size of each sphere is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

For the *rounded/polygon* body style, each body is drawn as a polygon. The *bflag2* argument selects how the bodies are represented: for a value of 1, only the faces are drawn; for a value of 2 instead only a wireframe outline is drawn; and for a value of 3 both the faces and the wireframe outline are drawn. The diameter of the wireframe cylinders is determined by the *bflag1* parameter for the *body* keyword.

For the *rounded/polyhedron* body style, each body is drawn as a polyhedron consisting of triangles and squares. The *bflag2* argument selects how the bodies are represented: for a value of 1, only the faces are drawn with some shading added; for a value of 2 instead only a wireframe mesh is drawn; for a value of 3 both the faces and the wireframe mesh are drawn; and for a value of 4 only the faces are drawn, but without shading. The diameter of the wireframe cylinders is determined by the *bflag1* parameter for the *body* keyword.

Note that for both the *rounded/polygon* and *rounded/polyhedron* styles, line segments are drawn between the pairs of vertices. Depending on the diameters of the line segments this may be slightly different than the physical extent of the body as calculated by the *pair_style rounded/polygon* or *pair_style rounded/polyhedron* commands. Conceptually, the pair styles define the surface of a 2d or 3d body by lines or planes that are tangent to the finite-size spheres of specified diameter which are placed on each vertex position.

10.5.5 Bonded particle models

The BPM package implements bonded particle models which can be used to simulate mesoscale solids. Solids are constructed as a collection of particles, which each represent a coarse-grained region of space much larger than the atomistic scale. Particles within a solid region are then connected by a network of bonds to model solid elasticity. There are many names for methods that are based on similar (or equivalent) capabilities to those in this package, including, but not limited to, cohesive beam models, bonded DEMs, lattice spring models, mass spring models, and lattice particle methods.

Unlike traditional bonds in molecular dynamics, the equilibrium bond length can vary between bonds. Bonds store the reference state. This includes setting the equilibrium length equal to the initial distance between the two particles, but can also include data on the bond orientation for rotational models. This produces a stress-free initial state. Furthermore, bonds are allowed to break under large strains, producing fracture. The *examples/bpm* directory has sample input scripts for simulations of the fragmentation of an impacted plate and the pouring of extended, elastic bodies. See (Clemmer) for more general information on the approach and the LAMMPS implementation. Example movies illustrating some of these capabilities are found at <https://www.lammps.org/movies.html#bpmpackage>.

Bonds can be created using a *read data* or *create bonds* command. Alternatively, a *molecule* template with bonds can be used with *fix deposit* or *fix pour* to create solid grains.

In this implementation, bonds store their reference state when they are first computed in the setup of the first simulation run. Data is then preserved across run commands and is written to *binary restart files* such that restarting the system will not reset the reference state of a bond. Bonds that are created midway into a run, such as those created by pouring grains using *fix pour*, are initialized on that timestep.

Currently, there are three types of bonds included in the BPM package. The first bond style, *bond bpm/spring*, only applies pairwise, central body forces. Point particles must have *bond atom style* and may be thought of as nodes in a spring network. An optional multibody term can be used to adjust the network's Poisson's ratio. The *bpm/spring/plastic* bond style is similar except it adds a plastic yield strain. Alternatively, the third bond style, *bond bpm/rotational*, resolves tangential forces and torques arising with the shearing, bending, and twisting of the bond due to rotation or displacement of particles. Particles are similar to those used in the *granular package*, *atom style sphere*. However, they must also track the current orientation of particles and store bonds, and therefore use a *bpm/sphere atom style*. This also requires a unique integrator *fix nve/bpm/sphere* which numerically integrates orientation similar to *fix nve/asphere*.

In addition to bond styles, a new pair style *pair bpm/spring* was added to accompany the *bpm/spring* bond style. By default, this pair style is simply a hookean repulsion with similar velocity damping as its sister bond style, but optional arguments can be used to modify the force.

Bond data can be output using a combination of standard LAMMPS commands. A list of IDs for bonded atoms can be generated using the *compute property/local* command. Various properties of bonds can be computed using the *compute bond/local* command. This command allows one to access data saved to the bond's history, such as the reference length of the bond. More information on bond history data can be found on the documentation pages for the specific BPM bond styles. Finally, this data can be output using a *dump local* command. As one may output many columns from the same compute, the *dump modify colname* option may be used to provide more helpful column names. An example of this procedure is found in */examples/bpm/pour/*. External software, such as OVITO, can read these dump files to render bond data.

Added in version 4Jul2026.

The *compute bond/local* property can also be visualized using *dump image* to color bonds by property using a color map. The */examples/GRAPHICS/in.bpm.fracture* example file shows how such a visualization can be constructed.

As bonds can potentially be broken between neighbor list builds, BPM bond styles may place restrictions on the *special_bonds* command. There are three possible scenarios which determine how pair interactions between bonded particles and special bond weights work.

The first option is the simplest. If bonds cannot break, then one can use any special bond settings to control pair forces. Namely, this is accomplished by setting the *break* keyword to *no*. Note that a zero coul weight for 1-2 bonds can be used to exclude bonded atoms from the neighbor list builds

```
special_bonds lj 0 1 1 coul 0 1 1
```

This can be useful for post-processing, or to determine pair interaction properties between distinct bonded particles.

If bonds can break, the second scenario is if pair forces are overlaid on top of bond forces such that atoms can simultaneously exchange both types of forces. This is accomplished by setting the *overlay/pair* keyword present in all bpm bond styles to *yes*. This case requires the following special bond settings

```
special_bonds lj/coul 1 1 1
```

Note that this scenario does not update special bond lists when bonds break, hence why fractional weights are not allowed. Whether or not two particles are bonded has no bearing on pair forces.

In the third scenario, bonds can break but pair forces are disabled between bonded particles. This is the default behavior of BPM bond styles. Unlike *bond quartic*, pair forces are not removed by subtracting pair forces during the bond computation, but rather by dynamically updating the 1-2 special bond list. To do this, LAMMPS requires *newton* bond off such that all processors containing an atom know when a bond breaks. Additionally, one must use the following special bond settings

```
special_bonds lj 0 1 1 coul 1 1 1
```

These settings accomplish two goals. First, they turn off 1-3 and 1-4 special bond lists, which are not currently supported for breakable BPMs. As BPMs often have dense bond networks, generating/updating 1-3 and 1-4 special bond lists can be expensive. By setting the *lj* weight for 1-2 bonds to zero, this turns off pairwise interactions. Even though there are no charges in BPM models, setting a nonzero *coul* weight for 1-2 bonds ensures all bonded neighbors are still included in the neighbor list in case bonds break between neighbor list builds.

To monitor the fracture of bonds in the system, all BPM bond styles have the ability to record instances of bond breakage to output using the *dump local* command. Since one may frequently output a list of broken bonds and the time they broke, the *dump modify* option *header no* may be useful to avoid repeatedly printing the header of the dump file. An example of this procedure is found in `/examples/bpm/impact/`. Additionally, one can use *compute nbond/atom* to tally the current number of bonds per atom.

See the [Howto](#) page on broken bonds for more information.

While LAMMPS has many utilities to create and delete bonds, *only* the following are currently compatible with BPM bond styles:

- *create_bonds*
- *delete_bonds*
- *fix bond/create*
- *fix bond/break*
- *fix bond/swap*

Note

The *create_bonds* command requires certain *special_bonds* settings. To subtract pair interactions, one will need to switch between different *special_bonds* settings in the input script. An example is found in `examples/bpm/impact`.

(Clemmer) Clemmer, Monti, Lechman, Soft Matter, 20, 1702 (2024).

10.5.6 Polarizable models

In polarizable force fields the charge distributions in molecules and materials respond to their electrostatic environments. Polarizable systems can be simulated in LAMMPS using three methods:

- the fluctuating charge method, implemented in the *QEQ* package,
- the adiabatic core-shell method, implemented in the *CORESHELL* package,
- the thermalized Drude dipole method, implemented in the *DRUDE* package.

The fluctuating charge method calculates instantaneous charges on interacting atoms based on the electronegativity equalization principle. It is implemented in the *fix qeq* which is available in several variants. It is a relatively efficient technique since no additional particles are introduced. This method allows for charge transfer between molecules or atom groups. However, because the charges are located at the interaction sites, off-plane components of polarization cannot be represented in planar molecules or atom groups.

The two other methods share the same basic idea: polarizable atoms are split into one core atom and one satellite particle (called shell or Drude particle) attached to it by a harmonic spring. Both atoms bear a charge and they represent collectively an induced electric dipole. These techniques are computationally more expensive than the QEq method because of additional particles and bonds. These two charge-on-spring methods differ in certain features, with the core-shell model being normally used for ionic/crystalline materials, whereas the so-called Drude model is normally used for molecular systems and fluid states.

The core-shell model is applicable to crystalline materials where the high symmetry around each site leads to stable trajectories of the core-shell pairs. However, bonded atoms in molecules can be so close that a core would interact too strongly or even capture the Drude particle of a neighbor. The Drude dipole model is relatively more complex in order to remedy this and other issues. Specifically, the Drude model includes specific thermostating of the core-Drude pairs and short-range damping of the induced dipoles.

The three polarization methods can be implemented through a self-consistent calculation of charges or induced dipoles at each timestep. In the fluctuating charge scheme this is done by the matrix inversion method in *fix qeq/point*, but for core-shell or Drude-dipoles the relaxed-dipoles technique would require an slow iterative procedure. These self-consistent solutions yield accurate trajectories since the additional degrees of freedom representing polarization are massless. An alternative is to attribute a mass to the additional degrees of freedom and perform time integration using an extended Lagrangian technique. For the fluctuating charge scheme this is done by *fix qeq/dynamic*, and for the charge-on-spring models by the methods outlined in the next two sections. The assignment of masses to the additional degrees of freedom can lead to unphysical trajectories if care is not exerted in choosing the parameters of the polarizable models and the simulation conditions.

In the core-shell model the vibration of the shells is kept faster than the ionic vibrations to mimic the fast response of the polarizable electrons. But in molecular systems thermalizing the core-Drude pairs at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, too short a timestep, etc.) In order to avoid these problems the relative motion of the Drude particles with respect to their cores is kept “cold” so the vibration of the core-Drude pairs is very slow, approaching the self-consistent regime. In both models the temperature is regulated using the velocities of the center of mass of core+shell (or Drude) pairs, but in the Drude model the actual relative core-Drude particle motion is thermostatted separately as well.

10.5.7 Adiabatic core/shell model

The adiabatic core-shell model by *Mitchell and Fincham* is a simple method for adding polarizability to a system. In order to mimic the electron shell of an ion, a satellite particle is attached to it. This way the ions are split into a core and a shell where the latter is meant to react to the electrostatic environment inducing polarizability. See the *Howto polarizable* page for a discussion of all the polarizable models available in LAMMPS.

Technically, shells are attached to the cores by a spring force $f = k \cdot r$ where k is a parameterized spring constant and r is the distance between the core and the shell. The charges of the core and the shell add up to the ion charge, thus $q(\text{ion}) = q(\text{core}) + q(\text{shell})$. This setup introduces the ion polarizability (α) given by $\alpha = q(\text{shell})^2 / k$. In a similar fashion the mass of the ion is distributed on the core and the shell with the core having the larger mass.

To run this model in LAMMPS, *atom_style full* can be used since atom charge and bonds are needed. Each kind of core/shell pair requires two atom types and a bond type. The core and shell of a core/shell pair should be bonded to each other with a harmonic bond that provides the spring force. For example, a data file for NaCl, as found in *examples/coreshell*, has this format:

```
432  atoms  # core and shell atoms
216  bonds  # number of core/shell springs
```

1 2 1 2 # spring for core/shell pair 1
2 2 3 4 # spring for core/shell pair 2
(...)
```

Non-Coulombic (e.g. Lennard-Jones) pairwise interactions are only defined between the shells. Coulombic interactions are defined between all cores and shells. If desired, additional bonds can be specified between cores.

The *special_bonds* command should be used to turn-off the Coulombic interaction within core/shell pairs, since that interaction is set by the bond spring. This is done using the *special_bonds* command with a 1-2 weight = 0.0, which is the default value. It needs to be considered whether one has to adjust the *special_bonds* weighting according to the molecular topology since the interactions of the shells are bypassed over an extra bond.

Note that this core/shell implementation does not require all ions to be polarized. One can mix core/shell pairs and ions without a satellite particle if desired.

Since the core/shell model permits distances of $r = 0.0$ between the core and shell, a pair style with a “cs” suffix needs to be used to implement a valid long-range Coulombic correction. Several such pair styles are provided in the CORESHELL package. See [this page](#) for details. All of the core/shell enabled pair styles require the use of a long-range Coulombic solver, as specified by the *kspace_style* command. Either the PPPM or Ewald solvers can be used.

For the NaCl example problem, these pair style and bond style settings are used:

```

pair_style born/coul/long/cs 20.0 20.0
pair_coeff * * 0.0 1.000 0.00 0.00 0.00
pair_coeff 3 3 487.0 0.23768 0.00 1.05 0.50 #Na-Na
pair_coeff 3 4 145134.0 0.23768 0.00 6.99 8.70 #Na-Cl
pair_coeff 4 4 405774.0 0.23768 0.00 72.40 145.40 #Cl-Cl

bond_style harmonic
```

(continues on next page)

(continued from previous page)

```
bond_coeff 1 63.014 0.0
bond_coeff 2 25.724 0.0
```

When running dynamics with the adiabatic core/shell model, the following issues should be considered. The relative motion of the core and shell particles corresponds to the polarization, hereby an instantaneous relaxation of the shells is approximated and a fast core/shell spring frequency ensures a nearly constant internal kinetic energy during the simulation. Thermostats can alter this polarization behavior, by scaling the internal kinetic energy, meaning the shell will not react freely to its electrostatic environment. Therefore it is typically desirable to decouple the relative motion of the core/shell pair, which is an imaginary degree of freedom, from the real physical system. To do that, the *compute temp/cs* command can be used, in conjunction with any of the thermostat fixes, such as *fix nvt* or *fix langevin*. This compute uses the center-of-mass velocity of the core/shell pairs to calculate a temperature, and ensures that velocity is what is rescaled for thermostating purposes. This compute also works for a system with both core/shell pairs and non-polarized ions (ions without an attached satellite particle). The *compute temp/cs* command requires input of two groups, one for the core atoms, another for the shell atoms. Non-polarized ions which might also be included in the treated system should not be included into either of these groups, they are taken into account by the *group-ID* (second argument) of the compute. The groups can be defined using the *group *type** command. Note that to perform thermostating using this definition of temperature, the *fix modify temp* command should be used to assign the compute to the thermostat fix. Likewise the *thermo_modify temp* command can be used to make this temperature be output for the overall system.

For the NaCl example, this can be done as follows:

```
group cores type 1 2
group shells type 3 4
compute CSequ all temp/cs cores shells
fix thermoberendsen all temp/berendsen 1427 1427 0.4 # thermostat for the true_
→physical system
fix thermostatequ all nve # integrator as needed for the_
→berendsen thermostat
fix_modify thermoberendsen temp CSequ
thermo_modify temp CSequ # output of center-of-mass_
→derived temperature
```

The pressure for the core/shell system is computed via the regular LAMMPS convention by *treating the cores and shells as individual particles*. For the thermo output of the pressure as well as for the application of a barostat, it is necessary to use an additional *pressure* compute based on the default *temperature* and specifying it as a second argument in *fix modify* and *thermo_modify* resulting in:

```
(...)
compute CSequ all temp/cs cores shells
compute thermo_press_lmp all pressure thermo_temp # pressure for individual_
→particles
thermo_modify temp CSequ press thermo_press_lmp # modify thermo to regular_
→pressure
fix press_bar all npt temp 300 300 0.04 iso 0 0 0.4
fix_modify press_bar temp CSequ press thermo_press_lmp # pressure modification for_
→correct kinetic scalar
```

If *compute temp/cs* is used, the decoupled relative motion of the core and the shell should in theory be stable. However numerical fluctuation can introduce a small momentum to the system, which is noticeable over long trajectories. Therefore it is recommendable to use the *fix momentum* command in combination with *compute temp/cs* when equilibrating the system to prevent any drift.

When initializing the velocities of a system with core/shell pairs, it is also desirable to not introduce energy into the

relative motion of the core/shell particles, but only assign a center-of-mass velocity to the pairs. This can be done by using the *bias* keyword of the *velocity create* command and assigning the *compute temp/cs* command to the *temp* keyword of the *velocity* command, e.g.

```
velocity all create 1427 134 bias yes temp CSequ
velocity all scale 1427 temp CSequ
```

To maintain the correct polarizability of the core/shell pairs, the kinetic energy of the internal motion shall remain nearly constant. Therefore the choice of spring force and mass ratio need to ensure much faster relative motion of the two atoms within the core/shell pair than their center-of-mass velocity. This allows the shells to effectively react instantaneously to the electrostatic environment and limits energy transfer to or from the core/shell oscillators. This fast movement also dictates the timestep that can be used.

The primary literature of the adiabatic core/shell model suggests that the fast relative motion of the core/shell pairs only allows negligible energy transfer to the environment. The mentioned energy transfer will typically lead to a small drift in total energy over time. This internal energy can be monitored using the *compute chunk/atom* and *compute temp/chunk* commands. The internal kinetic energies of each core/shell pair can then be summed using the *sum()* special function of the *variable* command. Or they can be time/averaged and output using the *fix ave/time* command. To use these commands, each core/shell pair must be defined as a “chunk”. If each core/shell pair is defined as its own molecule, the molecule ID can be used to define the chunks. If cores are bonded to each other to form larger molecules, the chunks can be identified by the *fix property/atom* via assigning a core/shell ID to each atom using a special field in the data file read by the *read_data* command. This field can then be accessed by the *compute property/atom* command, to use as input to the *compute chunk/atom* command to define the core/shell pairs as chunks.

For example if core/shell pairs are the only molecules:

```
read_data NaCl_CS_x0.1_prop.data
compute prop all property/atom molecule
compute cs_chunk all chunk/atom c_prop
compute csthern all temp/chunk cs_chunk temp internal com yes cdof 3.0      # note the
→chosen degrees of freedom for the core/shell pairs
fix ave_chunk all ave/time 10 1 10 c_csthern file chunk.dump mode vector
```

For example if core/shell pairs and other molecules are present:

```
fix csinfo all property/atom i_CSID      # property/atom command
read_data NaCl_CS_x0.1_prop.data fix csinfo NULL CS-Info # atom property added in the
→data-file
compute prop all property/atom i_CSID
(...)
```

The additional section in the data file would be formatted like this:

```
CS-Info      # header of additional section

1  1          # column 1 = atom ID, column 2 = core/shell ID
2  1
3  2
4  2
5  3
6  3
7  4
8  4
(...)
```

10.5.8 Drude induced dipoles

The thermalized Drude model represents induced dipoles by a pair of charges (the core atom and the Drude particle) connected by a harmonic spring. See the [Howto polarizable](#) doc page for a discussion of all the polarizable models available in LAMMPS.

The Drude model has a number of features aimed at its use in molecular systems ([Lamoureux and Roux](#)):

- Thermostatting of the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
- Consistent definition of 1-2 to 1-4 neighbors. A core-Drude particle pair represents a single (polarizable) atom, so the special screening factors in a covalent structure should be the same for the core and the Drude particle. Drude particles have to inherit the 1-2, 1-3, 1-4 special neighbor relations from their respective cores.
- Stabilization of the interactions between induced dipoles. Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short range can be done by Thole functions (for which there are physical grounds). This Thole damping is applied to the point charges composing the induced dipole (the charge of the Drude particle and the opposite charge on the core, not to the total charge of the core atom).

A detailed tutorial covering the usage of Drude induced dipoles in LAMMPS is on the [here](#).

As with the core-shell model, the cores and Drude particles should appear in the data file as standard atoms. The same holds for the springs between them, which are described by standard harmonic bonds. The nature of the atoms (core, Drude particle or non-polarizable) is specified via the [fix drude](#) command. The special list of neighbors is automatically refactored to account for the equivalence of core and Drude particles as regards special 1-2 to 1-4 screening. It may be necessary to use the [extra/special/per/atom](#) keyword of the [read_data](#) command. If using [fix shake](#), make sure no Drude particle is in this fix group.

There are three ways to thermostat the Drude particles at a low temperature: use either [fix langevin/drude](#) for a Langevin thermostat, or [fix drude/transform/*](#) for a Nose-Hoover thermostat, or [fix tgnvt/drude](#) for a temperature-grouped Nose-Hoover thermostat. The first and third require use of the command [comm_modify vel yes](#). The second requires two separate integration fixes like [nvt](#) or [npt](#). The correct temperatures of the reduced degrees of freedom can be calculated using the [compute temp/drude](#). This requires also to use the command [comm_modify vel yes](#).

Short-range damping of the induced dipole interactions can be achieved using Thole functions through the [pair style thole](#) in [pair_style hybrid/overlay](#) with a Coulomb pair style. It may be useful to use [coul/long/cs](#) or similar from the CORESHELL package if the core and Drude particle come too close, which can cause numerical issues.

10.5.9 Tutorial for Thermalized Drude oscillators in LAMMPS

This Howto document explains how to use Drude oscillators in LAMMPS to simulate polarizable systems using the DRUDE package. As an illustration, the input files for a simulation of 250 phenol molecules are documented. First of all, LAMMPS has to be compiled with the DRUDE package included. Then, the data file and input scripts have to be modified to include the Drude dipoles and how to handle them.

Example input scripts are available: [examples/PACKAGES/drude](#)

Overview of Drude induced dipoles

Polarizable atoms acquire an induced electric dipole moment under the action of an external electric field, for example the electric field created by the surrounding particles. Drude oscillators represent these dipoles by two fixed charges: the core (DC) and the Drude particle (DP) bound by a harmonic potential. The Drude particle can be thought of as the electron cloud whose center can be displaced from the position of the corresponding nucleus.

The sum of the masses of a core-Drude pair should be the mass of the initial (unsplit) atom, $m_C + m_D = m$. The sum of their charges should be the charge of the initial (unsplit) atom, $q_C + q_D = q$. A harmonic potential between the core and Drude partners should be present, with force constant k_D and an equilibrium distance of zero. The (half-)stiffness of the *harmonic bond* $K_D = k_D/2$ and the Drude charge q_D are related to the atom polarizability α by

$$K_D = \frac{1}{2} \frac{q_D^2}{\alpha}$$

Ideally, the mass of the Drude particle should be small, and the stiffness of the harmonic bond should be large, so that the Drude particle remains close to the core. The values of Drude mass, Drude charge, and force constant can be chosen following different strategies, as in the following examples of polarizable force fields:

- *Lamoureux and Roux* suggest adopting a global half-stiffness, $K_D = 500 \text{ kcal}/(\text{mol Ang}^2)$ - which corresponds to a force constant $k_D = 4184 \text{ kJ}/(\text{mol Ang}^2)$ - for all types of core-Drude bond, a global mass $m_D = 0.4 \text{ g/mol}$ (or u) for all types of Drude particles, and to calculate the Drude charges for individual atom types from the atom polarizabilities using equation (1). This choice is followed in the polarizable CHARMM force field.
- Alternately, *Schroeder and Steinhauser* suggest adopting a global charge $q_D = -1.0e$ and a global mass $m_D = 0.1 \text{ g/mol}$ (or u) for all Drude particles, and to calculate the force constant for each type of core-Drude bond from equation (1). The timesteps used by these authors are between 0.5 and 2 fs, with the degrees of freedom of the Drude oscillators kept cold at 1 K.
- In both these force fields hydrogen atoms are treated as non-polarizable.

The motion of the Drude particles can be calculated by minimizing the energy of the induced dipoles at each timestep, by an iterative, self-consistent procedure. The Drude particles can be massless and therefore do not contribute to the kinetic energy. However, the relaxed method is computationally slow. An extended-lagrangian method can be used to calculate the positions of the Drude particles, but this requires them to have mass. It is important in this case to decouple the degrees of freedom associated with the Drude oscillators from those of the normal atoms. Thermalizing the Drude dipoles at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, very short timestep, etc.), which can be remedied by the “cold Drude” technique (*Lamoureux and Roux*).

Two closely related models are used to represent polarization through “charges on a spring”: the core-shell model and the Drude model. Although the basic idea is the same, the core-shell model is normally used for ionic/crystalline materials, whereas the Drude model is normally used for molecular systems and fluid states. In ionic crystals the symmetry around each ion and the distance between them are such that the core-shell model is sufficiently stable. But to be applicable to molecular/covalent systems the Drude model includes two important features:

1. The possibility to thermostat the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
2. The Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle (shell) of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short range of the interactions between the point charges composing the induced dipole can be done by *Thole* functions.

Preparation of the data file

The data file is similar to a standard LAMMPS data file for *atom_style full*. The DPs and the *harmonic bonds* connecting them to their DC should appear in the data file as normal atoms and bonds.

You can use the *polarizer* tool (Python script distributed with the DRUDE package) to convert a non-polarizable data file (here *data.102494.lmp*) to a polarizable data file (*data-p.lmp*)

```
polarizer -q -f phenol.dff data.102494.lmp data-p.lmp
```

This will automatically insert the new atoms and bonds. The masses and charges of DCs and DPs are computed from *phenol.dff*, as well as the DC-DP bond constants. The file *phenol.dff* contains the polarizabilities of the atom types and the mass of the Drude particles, for instance:

```
# units: kJ/mol, A, deg
# kforce is in the form k/2 r_D^2
# type m_D/u   q_D/e   k_D   alpha/A3   thole
OH      0.4    -1.0    4184.0   0.63    0.67
CA      0.4    -1.0    4184.0   1.36    2.51
CAI     0.4    -1.0    4184.0   1.09    2.51
```

The hydrogen atoms are absent from this file, so they will be treated as non-polarizable atoms. In the non-polarizable data file *data.102494.lmp*, atom names corresponding to the atom type numbers have to be specified as comments at the end of lines of the *Masses* section. You probably need to edit it to add these names. It should look like

Masses

```
1 12.011 # CAI
2 12.011 # CA
3 15.999 # OH
4 1.008 # HA
5 1.008 # HO
```

Basic input file

The atom style should be set to (or derive from) *full*, so that you can define atomic charges and molecular bonds, angles, dihedrals...

The *polarizer* tool also outputs certain lines related to the input script (the use of these lines will be explained below). In order for LAMMPS to recognize that you are using Drude oscillators, you should use the fix *drude*. The command is

```
fix DRUDE all drude C C C N N D D D
```

The N, C, D following the *drude* keyword have the following meaning: There is one tag for each atom type. This tag is C for DCs, D for DPs and N for non-polarizable atoms. Here the atom types 1 to 3 (C and O atoms) are DC, atom types 4 and 5 (H atoms) are non-polarizable and the atom types 6 to 8 are the newly created DPs.

By recognizing the fix *drude*, LAMMPS will find and store matching DC-DP pairs and will treat DP as equivalent to their DC in the *special bonds* relations. It may be necessary to extend the space for storing such special relations. In this case extra space should be reserved by using the *extra/special/per/atom* keyword of either the *read_data* or *create_box* command. With our phenol, there is 1 more special neighbor for which space is required. Otherwise LAMMPS crashes and gives the required value.

```
read_data data-p.lmp extra/special/per/atom 1
```

Let us assume we want to run a simple NVT simulation at 300 K. Note that Drude oscillators need to be thermalized at a low temperature in order to approximate a self-consistent field (SCF), therefore it is not possible to simulate an NVE ensemble with this package. Since dipoles are approximated by a charged DC-DP pair, the *pair_style* must include Coulomb interactions, for instance *lj/cut/coul/long* with *kpspace_style pppm*. For example, with a cutoff of 10. and a precision 1.e-4:

```
pair_style lj/cut/coul/long 10.0
kspace_style ppm 1.0e-4
```

As compared to the non-polarizable input file, *pair_coeff* lines need to be added for the DPs. Since the DPs have no Lennard-Jones interactions, their ϵ is 0. so the only *pair_coeff* line that needs to be added is

```
pair_coeff * 6* 0.0 0.0 # All-DPs
```

Now for the thermalization, the simplest choice is to use the *fix langevin/drude*.

```
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
```

This applies a Langevin thermostat at temperature 300. to the centers of mass of the DC-DP pairs, with relaxation time 100 and with random seed 12345. This fix applies also a Langevin thermostat at temperature 1. to the relative motion of the DPs around their DCs, with relaxation time 20 and random seed 13977. Only the DCs and non-polarizable atoms need to be in this fix's group. LAMMPS will thermostat the DPs together with their DC. For this, ghost atoms need to know their velocities. Thus you need to add the following command:

```
comm_modify vel yes
```

In order to avoid that the center of mass of the whole system drifts due to the random forces of the Langevin thermostat on DCs, you can add the *zero yes* option at the end of the fix line.

If the fix *shake* is used to constrain the C-H bonds, it should be invoked after the fix *langevin/drude* for more accuracy.

```
fix SHAKE ATOMS shake 0.0001 20 0 t 4 5
```

Note

The group of the fix *shake* must not include the DPs. If the group *ATOMS* is defined by non-DPs atom types, you could use

Since the fix *langevin/drude* does not perform time integration (just modification of forces but no position/velocity updates), the fix *nve* should be used in conjunction.

```
fix NVE all nve
```

To avoid the flying ice cube artifact, where the atoms progressively freeze and the center of mass of the whole system drifts faster and faster, the fix *momentum* can be used. For instance:

```
fix MOMENTUM all momentum 100 linear 1 1 1
```

Finally, do not forget to update the atom type elements if you use them in a *dump_modify ... element ...* command, by adding the element type of the DPs. Here for instance

```
dump DUMP all custom 10 dump.lammpstrj id mol type element x y z ix iy iz
dump_modify DUMP element C C O H H D D D
```

The input file should now be ready for use!

You will notice that the global temperature *thermo_temp* computed by LAMMPS is not 300. K as wanted. This is because LAMMPS treats DPs as standard atoms in its default compute. If you want to output the temperatures of the DC-DP pair centers of mass and of the DPs relative to their DCs, you should use the *compute temp_drude*

```
compute TDRUDE all temp/drude
```

And then output the correct temperatures of the Drude oscillators using *thermo_style custom* with respectively *c_TDRUDE[1]* and *c_TDRUDE[2]*. These should be close to 300.0 and 1.0 on average.

```
thermo_style custom step temp c_TDRUDE[1] c_TDRUDE[2]
```

Thole screening

Dipolar interactions represented by point charges on springs may not be stable, for example if the atomic polarizability is too high for instance, a DP can escape from its DC and be captured by another DC, which makes the force and energy diverge and the simulation crash. Even without reaching this extreme case, the correlation between nearby dipoles on the same molecule may be exaggerated. Often, special bond relations prevent bonded neighboring atoms to see the charge of each other's DP, so that the problem does not always appear. It is possible to use screened dipole-dipole interactions by using the **pair_style thole**. This is implemented as a correction to the Coulomb pair_styles, which dampens at short distance the interactions between the charges representing the induced dipoles. It is to be used as *hybrid/overlay* with any standard *coul* pair style. In our example, we would use

```
pair_style hybrid/overlay lj/cut/coul/long 10.0 thole 2.6 10.0
```

This tells LAMMPS that we are using two pair_styles. The first one is as above (*lj/cut/coul/long 10.0*). The second one is a *thole* pair_style with default screening factor 2.6 (*Noskov*) and cutoff 10.0.

Since *hybrid/overlay* does not support mixing rules, the interaction coefficients of all the pairs of atom types with $i < j$ should be explicitly defined. The output of the *polarizer* script can be used to complete the *pair_coeff* section of the input file. In our example, this will look like:

```
pair_coeff 1 1 lj/cut/coul/long 0.0700 3.550
pair_coeff 1 2 lj/cut/coul/long 0.0700 3.550
pair_coeff 1 3 lj/cut/coul/long 0.1091 3.310
pair_coeff 1 4 lj/cut/coul/long 0.0458 2.985
pair_coeff 2 2 lj/cut/coul/long 0.0700 3.550
pair_coeff 2 3 lj/cut/coul/long 0.1091 3.310
pair_coeff 2 4 lj/cut/coul/long 0.0458 2.985
pair_coeff 3 3 lj/cut/coul/long 0.1700 3.070
pair_coeff 3 4 lj/cut/coul/long 0.0714 2.745
pair_coeff 4 4 lj/cut/coul/long 0.0300 2.420
pair_coeff * 5 lj/cut/coul/long 0.0000 0.000
pair_coeff * 6* lj/cut/coul/long 0.0000 0.000
pair_coeff 1 1 thole 1.090 2.510
pair_coeff 1 2 thole 1.218 2.510
pair_coeff 1 3 thole 0.829 1.590
pair_coeff 1 6 thole 1.090 2.510
pair_coeff 1 7 thole 1.218 2.510
pair_coeff 1 8 thole 0.829 1.590
pair_coeff 2 2 thole 1.360 2.510
pair_coeff 2 3 thole 0.926 1.590
pair_coeff 2 6 thole 1.218 2.510
pair_coeff 2 7 thole 1.360 2.510
pair_coeff 2 8 thole 0.926 1.590
pair_coeff 3 3 thole 0.630 0.670
pair_coeff 3 6 thole 0.829 1.590
pair_coeff 3 7 thole 0.926 1.590
```

(continues on next page)

(continued from previous page)

pair_coeff	3	8	thole	0.630	0.670
pair_coeff	6	6	thole	1.090	2.510
pair_coeff	6	7	thole	1.218	2.510
pair_coeff	6	8	thole	0.829	1.590
pair_coeff	7	7	thole	1.360	2.510
pair_coeff	7	8	thole	0.926	1.590
pair_coeff	8	8	thole	0.630	0.670

For the *thole* pair style the coefficients are

1. the atom polarizability in units of cubic length
2. the screening factor of the Thole function (optional, default value specified by the *pair_style* command)
3. the cutoff (optional, default value defined by the *pair_style* command)

The special neighbors have charge-charge and charge-dipole interactions screened by the *coul* factors of the *special_bonds* command (0.0, 0.0, and 0.5 in the example above). Without using the *pair_style thole*, dipole-dipole interactions are screened by the same factor. By using the *pair_style thole*, dipole-dipole interactions are screened by Thole's function, whatever their special relationship (except within each DC-DP pair of course). Consider for example 1-2 neighbors: using the *pair_style thole*, their dipoles will see each other (despite the *coul* factor being 0.) and the interactions between these dipoles will be damped by Thole's function.

Thermostats and barostats

Using a Nose-Hoover barostat with the *langevin/drude* thermostat is straightforward using *fix nph* instead of *nve*. For example:

```
fix NPH all nph iso 1. 1. 500
```

It is also possible to use a Nose-Hoover instead of a Langevin thermostat. This requires to use **fix drude/transform** just before and after the time integration fixes. The *fix drude/transform/direct* converts the atomic masses, positions, velocities and forces into a reduced representation, where the DCs transform into the centers of mass of the DC-DP pairs and the DPs transform into their relative position with respect to their DC. The *fix drude/transform/inverse* performs the reverse transformation. For a NVT simulation, with the DCs and atoms at 300 K and the DPs at 1 K relative to their DC one would use

```
fix DIRECT all drude/transform/direct
fix NVT1 ATOMS nvt temp 300. 300. 100
fix NVT2 DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

For our phenol example, the groups would be defined as

```
group ATOMS type 1 2 3 4 5 # DCs and non-polarizable atoms
group CORES type 1 2 3      # DCs
group DRUDES type 6 7 8     # DPs
```

Note that with the fixes *drude/transform*, it is not required to specify *comm_modify vel yes* because the fixes do it anyway (several times and for the forces also).

It is a bit more tricky to run a NPT simulation with Nose-Hoover barostat and thermostat. First, the volume should be integrated only once. So the fix for DCs and atoms should be *npt* while the fix for DPs should be *nvt* (or vice versa). Second, the *fix npt* computes a global pressure and thus a global temperature whatever the fix group. We do want the pressure to correspond to the whole system, but we want the temperature to correspond to the fix group only. We must

then use the *fix_modify* command for this. In the end, the block of instructions for thermostating and barostatting will look like

```
compute TATOMS ATOMS temp
fix DIRECT all drude/transform/direct
fix NPT ATOMS npt temp 300. 300. 100 iso 1. 1. 500
fix_modify NPT temp TATOMS press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

Another option for thermalizing the Drude model is to use the temperature-grouped Nose-Hoover (TGNH) thermostat proposed by (Son). This is implemented as *fix tgnvt/drude* and *fix tgnpt/drude*. It separates the kinetic energy into three contributions: the molecular center of mass (COM) motion, the motion of atoms or atom-Drude pairs relative to molecular COMs, and the relative motion of atom-Drude pairs. An independent Nose-Hoover chain is applied to each type of motion. When TGNH is used, the temperatures of molecular, atomic and Drude motion can be printed out with *thermo_style command* command.

NVT simulation with TGNH thermostat

```
comm_modify vel yes
fix TGNVT all tgnvt/drude temp 300. 300. 100 1. 20
thermo_style custom f_TGNVT[1] f_TGNVT[2] f_TGNVT[3]
```

NPT simulation with TGNH thermostat

```
comm_modify vel yes
fix TGNPT all tgnpt/drude temp 300. 300. 100 1. 20 iso 1. 1. 500
thermo_style custom f_TGNPT[1] f_TGNPT[2] f_TGNPT[3]
```

Rigid bodies

You may want to simulate molecules as rigid bodies (but polarizable). Common cases are water models such as *SWM4-NDP*, which is a kind of polarizable TIP4P water. The rigid bodies and the DPs should be integrated separately, even with the Langevin thermostat. Let us review the different thermostats and ensemble combinations.

NVT ensemble using Langevin thermostat:

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nve/small molecule
fix NVE DRUDES nve
```

NVT ensemble using Nose-Hoover thermostat:

```
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/nvt/small molecule temp 300. 300. 100
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

NPT ensemble with Langevin thermostat:

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nph/small molecule iso 1. 1. 500
fix NVE DRUDES nve
```

NPT ensemble using Nose-Hoover thermostat:

```
compute TATOM ATOMS temp
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/npt/small molecule temp 300. 300. 100 iso 1. 1. 500
fix_modify RIGID temp TATOM press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

10.5.10 Peridynamics with LAMMPS

This Howto is based on the Sandia report 2010-5549 by Michael L. Parks, Pablo Seleson, Steven J. Plimpton, Richard B. Lehoucq, and Stewart A. Silling.

Overview

Peridynamics is a nonlocal extension of classical continuum mechanics. The discrete peridynamic model has the same computational structure as a molecular dynamics model. This Howto provides a brief overview of the peridynamic model of a continuum, then discusses how the peridynamic model is discretized within LAMMPS as described in the original article (*Parks*). An example problem with comments is also included.

Quick Start

The peridynamics styles are included in the optional *PERI package*. If your LAMMPS executable does not already include the PERI package, you can see the *build instructions for packages* for how to enable the package when compiling a custom version of LAMMPS from source.

Here is a minimal example for setting up a peridynamics simulation.

```
units          si
boundary       s s s
lattice        sc 0.0005
atom_style     peri
atom_modify    map array
neighbor       0.0010 bin
region         target cylinder y 0.0 0.0 0.0050 -0.0050 0.0 units box
create_box     1 target
create_atoms   1 region target

pair_style     peri/pmb
pair_coeff      * * 1.6863e22 0.0015001 0.0005 0.25
set            group all density 2200
set            group all volume 1.25e-10
velocity       all set 0.0 0.0 0.0 sum no units box
```

(continues on next page)

(continued from previous page)

```
fix          1 all nve
compute      1 all damage/atom
timestep     1.0e-7
```

Some notes on this input example:

- peridynamics simulations typically use SI *units*
- particles must be created on a *simple cubic lattice*
- using the *atom style peri* is required
- an *atom map* is required for indexing particles
- The *skin distance* used when computing neighbor lists should be defined appropriately for your choice of simulation parameters. The *skin* should be set to a value such that the peridynamic horizon plus the skin distance is larger than the maximum possible distance between two bonded particles (before their bond breaks). Here it is set to 0.001 meters.
- a *peridynamics pair style* is required. Available choices are currently: *peri/eps*, *peri/lps*, *peri/pmb*, and *peri/ves*. The model parameters are set with a *pair_coeff* command.
- the mass density and volume fraction for each particle must be defined. This is done with the two *set* commands for *density* and *volume*. For a simple cubic lattice, the volume of a particle should be equal to the cube of the lattice constant, here $V_i = \Delta x^3$.
- with the *velocity* command all particles are initially at rest
- a plain *velocity-Verlet time integrator* is used, which is algebraically equivalent to a centered difference in time, but numerically more stable
- you can compute the damage at the location of each particle with *compute damage/atom*
- finally, the timestep is set to 0.1 microseconds with the *timestep* command.

Peridynamic Model of a Continuum

The following is not a complete overview of peridynamics, but a discussion of only those details specific to the model we have implemented within LAMMPS. For more on the peridynamic theory, the reader is referred to (*Silling 2007*). To begin, we define the notation we will use.

Basic Notation

Within the peridynamic literature, the following notational conventions are generally used. The position of a given point in the reference configuration is $\mathbf{x}$. Let $\mathbf{u}(\mathbf{x}, t)$ and $\mathbf{y}(\mathbf{x}, t)$ denote the displacement and position, respectively, of the point $\mathbf{x}$ at time t . Define the relative position and displacement vectors of two bonded points $\mathbf{x}$ and $\mathbf{x}'$ as $\xi = \mathbf{x}' - \mathbf{x}$ and $\eta = \mathbf{u}(\mathbf{x}', t) - \mathbf{u}(\mathbf{x}, t)$, respectively. We note here that η is time-dependent, and that ξ is not. It follows that the relative position of the two bonded points in the current configuration can be written as $\xi + \eta = \mathbf{y}(\mathbf{x}', t) - \mathbf{y}(\mathbf{x}, t)$.

Peridynamic models are frequently written using *states*, which we briefly describe here. For the purposes of our discussion, all states are operators that act on vectors in $\mathbb{R}^3$. For a more complete discussion of states, see (*Silling 2007*). A *vector state* is an operator whose image is a vector, and may be viewed as a generalization of a second-rank tensor. Similarly, a *scalar state* is an operator whose image is a scalar. Of particular interest is the vector force state $\underline{\mathbf{T}}[\mathbf{x}, t](\mathbf{x}' - \mathbf{x})$, which is a mapping, having units of force per volume squared, of the vector $\mathbf{x}' - \mathbf{x}$ to the force vector state field. The vector state operator $\underline{\mathbf{T}}$ may itself be a function of $\mathbf{x}$ and t . The constitutive model is completely contained within $\underline{\mathbf{T}}$.

In the peridynamic theory, the deformation at a point depends collectively on all points interacting with that point. Using the notation of (*Silling 2007*), we write the peridynamic equation of motion as

$$\rho(\mathbf{x})\ddot{\mathbf{u}}(\mathbf{x}, t) = \int_{\mathcal{H}_{\mathbf{x}}} \{ \underline{\mathbf{T}}[\mathbf{x}, t] \langle \mathbf{x}' - \mathbf{x} \rangle - \underline{\mathbf{T}}[\mathbf{x}', t] \langle \mathbf{x} - \mathbf{x}' \rangle \} dV_{\mathbf{x}'} + \mathbf{b}(\mathbf{x}, t), \quad (1)$$

where ρ represents the mass density, $\underline{\mathbf{T}}$ the force vector state, and $\mathbf{b}$ an external body force density. A point $\mathbf{x}$ interacts with all the points $\mathbf{x}'$ within the neighborhood $\mathcal{H}_{\mathbf{x}}$, assumed to be a spherical region of radius $\delta > 0$ centered at $\mathbf{x}$. δ is called the *horizon*, and is analogous to the cutoff radius used in molecular dynamics. Conditions on $\underline{\mathbf{T}}$ for which (1) satisfies the balance of linear and angular momentum are given in (Silling 2007).

We consider only force vector states that can be written as

$$\underline{\mathbf{T}} = \underline{t} \underline{\mathbf{M}},$$

with $\underline{t}$ a scalar force state and $\underline{\mathbf{M}}$ the deformed direction vector state, defined by

$$\underline{\mathbf{M}}\langle \xi \rangle = \begin{cases} \frac{\xi + \eta}{\|\xi + \eta\|} & \|\xi + \eta\| \neq 0 \\ 0 & \text{otherwise} \end{cases}. \quad (2)$$

Such force states correspond to so-called *ordinary* materials (Silling 2007). These are the materials for which the force between any two interacting points $\mathbf{x}$ and $\mathbf{x}'$ acts along the line between the points.

Linear Peridynamic Solid (LPS) Model

We summarize the linear peridynamic solid (LPS) material model. For more on this model, the reader is referred to (Silling 2007). This model is a nonlocal analogue to a classical linear elastic isotropic material. The elastic properties of a classical linear elastic isotropic material are determined by (for example) the bulk and shear moduli. For the LPS model, the elastic properties are analogously determined by the bulk and shear moduli, along with the horizon δ .

The LPS model has a force scalar state

$$\underline{t} = \frac{3K\theta}{m} \underline{\omega} \underline{x} + \alpha \underline{\omega} \underline{e}^d, \quad (3)$$

with K the bulk modulus and α related to the shear modulus G as

$$\alpha = \frac{15G}{m}.$$

The remaining components of the model are described as follows. Define the reference position scalar state $\underline{x}$ so that $\underline{x}\langle \xi \rangle = \|\xi\|$. Then, the weighted volume m is defined as

$$m[\mathbf{x}] = \int_{\mathcal{H}_{\mathbf{x}}} \underline{\omega}\langle \xi \rangle \underline{x}\langle \xi \rangle \underline{x}\langle \xi \rangle dV_{\xi}. \quad (4)$$

Let

$$\underline{e}[\mathbf{x}, t]\langle \xi \rangle = \|\xi + \eta\| - \|\xi\|$$

be the extension scalar state, and

$$\theta[\mathbf{x}, t] = \frac{3}{m[\mathbf{x}]} \int_{\mathcal{H}_{\mathbf{x}}} \underline{\omega}\langle \xi \rangle \underline{x}\langle \xi \rangle \underline{e}[\mathbf{x}, t]\langle \xi \rangle dV_{\xi}$$

be the dilatation. The isotropic and deviatoric parts of the extension scalar state are defined, respectively, as

$$\underline{e}^i = \frac{\theta \underline{x}}{3}, \quad \underline{e}^d = \underline{e} - \underline{e}^i,$$

where the arguments of the state functions and the vectors on which they operate are omitted for simplicity. We note that the LPS model is linear in the dilatation θ , and in the deviatoric part of the extension $\underline{e}^d$.

Note

The weighted volume m is time-independent, and does not change as bonds break. It is computed with respect to the bond family defined at the reference (initial) configuration.

The non-negative scalar state $\underline{\omega}$ is an *influence function* (Silling 2007). For more on influence functions, see (Seleson 2010). If an influence function $\underline{\omega}$ depends only upon the scalar $\|\xi\|$, (i.e., $\underline{\omega}(\xi) = \underline{\omega}(\|\xi\|)$), then $\underline{\omega}$ is a spherical influence function. For a spherical influence function, the LPS model is isotropic (Silling 2007).

Note

In the LAMMPS implementation of the LPS model, the influence function $\underline{\omega}(\|\xi\|) = 1/\|\xi\|$ is used. However, the user can define their own influence function by altering the method “influence_function” in the file `pair_peri_lps.cpp`. The LAMMPS peridynamics code permits both spherical and non-spherical influence functions (e.g., isotropic and non-isotropic materials).

Prototype Microelastic Brittle (PMB) Model

We summarize the prototype microelastic brittle (PMB) material model. For more on this model, the reader is referred to (Silling 2000) and (Silling 2005). This model is a special case of the LPS model; see (Seleson 2010) for the derivation. The elastic properties of the PMB model are determined by the bulk modulus K and the horizon δ .

The PMB model is expressed using the scalar force state field

$$\underline{t}[\mathbf{x}, t](\xi) = \frac{1}{2} f(\eta, \xi), \quad (5)$$

with f a scalar-valued function. We assume that f takes the form

$$f = cs,$$

where

$$c = \frac{18K}{\pi\delta^4}, \quad (6)$$

with K the bulk modulus and δ the horizon, and s the bond stretch, defined as

$$s(t, \eta, \xi) = \frac{\|\eta + \xi\| - \|\xi\|}{\|\xi\|}.$$

Bond stretch is a unitless quantity, and identical to a one-dimensional definition of strain. As such, we see that a bond at its equilibrium length has stretch $s = 0$, and a bond at twice its equilibrium length has stretch $s = 1$. The constant c given above is appropriate for 3D models only. For more on the origins of the constant c , see (Silling 2005). For the derivation of c for 1D and 2D models, see (Emmrich).

Given (5), (1) reduces to

$$\rho(\mathbf{x})\ddot{\mathbf{u}}(\mathbf{x}, t) = \int_{\mathcal{H}_{\mathbf{x}}} \mathbf{f}(\eta, \xi) dV_{\xi} + \mathbf{b}(\mathbf{x}, t), \quad (7)$$

with

$$\mathbf{f}(\eta, \xi) = f(\eta, \xi) \frac{\xi + \eta}{\|\xi + \eta\|}.$$

Unlike the LPS model, the PMB model has a Poisson ratio of $\nu = 1/4$ in 3D, and $\nu = 1/3$ in 2D. This is reflected in the input for the PMB model, which requires only the bulk modulus of the material, whereas the LPS model requires both the bulk and shear moduli.

Damage

Bonds are made to break when they are stretched beyond a given limit. Once a bond fails, it is failed forever (*Silling*). Further, new bonds are never created during the course of a simulation. We discuss only one criterion for bond breaking, called the *critical stretch* criterion.

Define μ to be the history-dependent scalar boolean function

$$\mu(t, \eta, \xi) = \begin{cases} 1 & \text{if } s(t', \eta, \xi) < \min(s_0(t', \eta, \xi), s_0(t', \eta', \xi')) \text{ for all } 0 \leq t' \leq t \\ 0 & \text{otherwise} \end{cases} \quad (8)$$

where $\eta' = \mathbf{u}(\mathbf{x}'', t) - \mathbf{u}(\mathbf{x}', t)$ and $\xi' = \mathbf{x}'' - \mathbf{x}'$. Here, $s_0(t, \eta, \xi)$ is a critical stretch defined as

$$s_0(t, \eta, \xi) = s_{00} - \alpha s_{\min}(t, \eta, \xi), \quad s_{\min}(t) = \min_{\xi} s(t, \eta, \xi), \quad (9)$$

where s_{00} and α are material-dependent constants. The history function μ breaks bonds when the stretch s exceeds the critical stretch s_0 .

Although $s_0(t, \eta, \xi)$ is expressed as a property of a particle, bond breaking must be a symmetric operation for all particle pairs sharing a bond. That is, particles $\mathbf{x}$ and $\mathbf{x}'$ must utilize the same test when deciding to break their common bond. This can be done by any method that treats the particles symmetrically. In the definition of μ above, we have chosen to take the minimum of the two s_0 values for particles $\mathbf{x}$ and $\mathbf{x}'$ when determining if the $\mathbf{x}$ - $\mathbf{x}'$ bond should be broken.

Following (*Silling*), we can define the damage at a point $\mathbf{x}$ as

$$\phi(\mathbf{x}, t) = 1 - \frac{\int_{\mathcal{H}_{\mathbf{x}}} \mu(t, \eta, \xi) dV_{\mathbf{x}'}}{\int_{\mathcal{H}_{\mathbf{x}}} dV_{\mathbf{x}'}}. \quad (10)$$

Discrete Peridynamic Model and LAMMPS Implementation

In LAMMPS, instead of (1), we model this equation of motion:

$$\rho(\mathbf{x})\ddot{\mathbf{y}}(\mathbf{x}, t) = \int_{\mathcal{H}_{\mathbf{x}}} \{ \mathbf{T}[\mathbf{x}, t] \langle \mathbf{x}' - \mathbf{x} \rangle - \mathbf{T}[\mathbf{x}', t] \langle \mathbf{x} - \mathbf{x}' \rangle \} dV_{\mathbf{x}'} + \mathbf{b}(\mathbf{x}, t),$$

where we explicitly track and store at each timestep the positions and not the displacements of the particles. We observe that $\ddot{\mathbf{y}}(\mathbf{x}, t) = \ddot{\mathbf{x}} + \ddot{\mathbf{u}}(\mathbf{x}, t) = \ddot{\mathbf{u}}(\mathbf{x}, t)$, so that this is equivalent to (1).

Spatial Discretization

The region defining a peridynamic material is discretized into particles forming a simple cubic lattice with lattice constant Δx , where each particle i is associated with some volume fraction V_i . For any particle i , let $\mathcal{F}_i$ denote the family of particles for which particle i shares a bond in the reference configuration. That is,

$$\mathcal{F}_i = \{p \mid \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta\}. \quad (11)$$

The discretized equation of motion replaces (1) with

$$\rho \ddot{\mathbf{y}}_i^n = \sum_{p \in \mathcal{F}_i} \left\{ \underline{\mathbf{T}}[\mathbf{x}_i, t] \langle \mathbf{x}'_p - \mathbf{x}_i \rangle - \underline{\mathbf{T}}[\mathbf{x}_p, t] \langle \mathbf{x}_i - \mathbf{x}_p \rangle \right\} V_p + \mathbf{b}_i^n, \quad (12)$$

where n is the timestep number and subscripts denote the particle number.

Short-Range Forces

In the model discussed so far, particles interact only through their bond forces. A particle with no bonds becomes a free non-interacting particle. To account for contact forces, short-range forces are introduced (*Silling 2007*). We add to the force in (12) the following force

$$\mathbf{f}_S(\mathbf{y}_p, \mathbf{y}_i) = \min \left\{ 0, \frac{c_S}{\delta} (\|\mathbf{y}_p - \mathbf{y}_i\| - d_{pi}) \right\} \frac{\mathbf{y}_p - \mathbf{y}_i}{\|\mathbf{y}_p - \mathbf{y}_i\|}, \quad (13)$$

where d_{pi} is the short-range interaction distance between particles p and i , and c_S is a multiple of the constant c from (6). Note that the short-range force is always repulsive, never attractive. In practice, we choose

$$c_S = 15 \frac{18K}{\pi \delta^4}. \quad (14)$$

For the short-range interaction distance, we choose (*Silling 2007*)

$$d_{pi} = \min \{ 0.9 \|\mathbf{x}_p - \mathbf{x}_i\|, 1.35(r_p + r_i) \}, \quad (15)$$

where r_i is called the *node radius* of particle i . Given a discrete lattice, we choose r_i to be half the lattice constant.

Note

For a simple cubic lattice, $\Delta x = \Delta y = \Delta z$.

Given this definition of d_{pi} , contact forces appear only when particles are under compression.

When accounting for short-range forces, it is convenient to define the short-range family of particles

$$\mathcal{F}_i^S = \{p \mid \|\mathbf{y}_p - \mathbf{y}_i\| \leq d_{pi}\}.$$

Modification to the Particle Volume

The right-hand side of (12) may be thought of as a midpoint quadrature of (1). To slightly improve the accuracy of this quadrature, we discuss a modification to the particle volume used in (12). In a situation where two particles share a bond with $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta$, for example, we suppose that only approximately half the volume of each particle is “seen” by the other (*Silling 2007*). When computing the force of each particle on the other we use $V_p/2$ rather than V_p in (12). As such, we introduce a nodal volume scaling function for all bonded particles where $\delta - r_i \leq \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta$ (see the Figure below).

We choose to use a linear unitless nodal volume scaling function

$$v(\mathbf{x}_p - \mathbf{x}_i) = \begin{cases} -\frac{1}{2r_i} \|\mathbf{x}_p - \mathbf{x}_i\| + \left(\frac{\delta}{2r_i} + \frac{1}{2}\right) & \text{if } \delta - r_i \leq \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta \\ 1 & \text{if } \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta - r_i \\ 0 & \text{otherwise} \end{cases}$$

If $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta$, $v = 0.5$, and if $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta - r_i$, $v = 1.0$, for example.

Fig. 3: Diagram showing horizon of a particular particle, demonstrating that the volume associated with particles near the boundary of the horizon is not completely contained within the horizon.

Temporal Discretization

When discretizing time in LAMMPS, we use a velocity-Verlet scheme, where both the position and velocity of the particle are stored explicitly. The velocity-Verlet scheme is generally expressed in three steps. In [Algorithm 1](#), ρ_i denotes the mass density of a particle and $\tilde{\mathbf{f}}_i^n$ denotes the net force density on particle i at timestep n . The LAMMPS command `fix nve` performs a velocity-Verlet integration.

Algorithm 1: Velocity Verlet

- 1: $\mathbf{v}_i^{n+1/2} = \mathbf{v}_i^n + \frac{\Delta t}{2\rho_i} \tilde{\mathbf{f}}_i^n$
- 2: $\mathbf{y}_i^{n+1} = \mathbf{y}_i^n + \Delta t \mathbf{v}_i^{n+1/2}$
- 3: $\mathbf{v}_i^{n+1} = \mathbf{v}_i^{n+1/2} + \frac{\Delta t}{2\rho_i} \tilde{\mathbf{f}}_i^{n+1}$

Breaking Bonds

During the course of simulation, it may be necessary to break bonds, as described in the [Damage section](#). Bonds are recorded as broken in a simulation by removing them from the bond family $\mathcal{F}_i$ (see [\(11\)](#)).

A naive implementation would have us first loop over all bonds and compute s_{min} in [\(9\)](#), then loop over all bonds again and break bonds with a stretch $s > s_0$ as in [\(8\)](#), and finally loop over all particles and compute forces for the next step of [Algorithm 1](#). For reasons of computational efficiency, we instead store the per-particle minimum stretch s_{min} from the *previous* timestep and, when deciding whether to break a bond, form its critical stretch $s_0 = s_{00} - \alpha s_{min}$ from that bond's own s_{00} and α . This keeps the criterion correct when s_{00} and α differ between atom-type pairs (for example, a deliberately weakened interface).

Changed in version 4Jul2026.

Earlier versions stored a single per-particle critical stretch s_0 (the maximum of $s_{00} - \alpha s$ over a particle's bonds), which reproduces [\(9\)](#) only when s_{00} and α are identical for all atom-type pairs.

Note

For the first timestep, s_0 is initialized to ∞ for all nodes. This means that no bonds may be broken until the second timestep. As such, it is recommended that the first few timesteps of the peridynamic simulation not involve any actions that might result in the breaking of bonds. As a practical example, the projectile in the [commented example below](#) is placed such that it does not impact the target brittle plate until several timesteps into the simulation.

LPS Pseudocode

A sketch of the LPS model implementation in the PERI package appears in [Algorithm 2](#). This algorithm makes use of the routines in [Algorithm 3](#) and [Algorithm 4](#).

Algorithm 2: LPS Peridynamic Model Pseudocode

Fix s_{00} , α , horizon δ , bulk modulus K , shear modulus G , timestep Δt , and generate initial lattice of particles with lattice constant Δx . Let there be N particles. Define constant c_S for repulsive short-range forces.

Initialize bonds between all particles $i \neq j$ where $\|\mathbf{x}_j - \mathbf{x}_i\| \leq \delta$

Initialize weighted volume m for all particles using [Algorithm 3](#)

Initialize $s_0 = \infty$ {Initialize each entry to MAX_DOUBLE}

while not done **do**

 Perform step 1 of [Algorithm 1](#), updating velocities of all particles

 Perform step 2 of [Algorithm 1](#), updating positions of all particles

$\tilde{s}_0 = \infty$ {Initialize each entry to MAX_DOUBLE}

for $i = 1$ to N **do**

 {Compute short-range forces}

for all particles $j \in \mathcal{F}_i^S$ (the short-range family of nodes for particle i) **do**

$r = \|\mathbf{y}_j - \mathbf{y}_i\|$

$dr = \min\{0, r - d\}$ {Short-range forces are only repulsive, never attractive}

$k = \frac{c_S}{\delta} V_k dr$ { c_S defined in :ref:`(14) <pericS>`}

$\mathbf{f} = \mathbf{f} + k \frac{\mathbf{y}_j - \mathbf{y}_i}{\|\mathbf{y}_j - \mathbf{y}_i\|}$

end for

end for

 Compute the dilatation for each particle using [Algorithm 4](#)

for $i = 1$ to N **do**

Damage

The damage associated with every particle (see [\(10\)](#)) can optionally be computed and output with a LAMMPS data dump. To do this, your input script must contain the command `compute damage/atom`. This enables a LAMMPS per-atom compute to calculate the damage associated with each particle every time a LAMMPS `data dump` frame is written.

Visualizing Simulation Results

There are multiple ways to visualize the simulation results. Typically, you want to display the particles and color code them by the value computed with the `compute damage/atom` command.

This can be done, for example, by using the built-in visualizer of the `dump image or dump movie` command to create snapshot images or a movie. Below are example command for using `dump image` with the [example listed below](#) and a set of images created for steps 300, 600, and 2000 this way.

```

dump          D2 all image 100 dump.peri.*.png c_C1 type box no 0.0 view 30 60 zoom 1.
→5 up 0 0 -1 ssao yes 4539 0.6
dump_modify   D2 pad 5 adiam * 0.001 amap 0.0 1.0 ca 0.1 3 min blue 0.5 yellow max red

```

For interactive visualization, the [Ovito](#) is very convenient to use. Below are steps to create a visualization of the *same example from below* now using the generated trajectory in the `dump.peri` file.

- Launch Ovito
- File -> Load File -> `dump.peri`
- Select “-> Particle types” and under “Appearance” set “Display radius:” to 0.0005
- From the “Add modification:” drop down list select “Color coding”
- Under “Color coding” select from the “Color gradient” drop down list “Jet”
- Also under “Color coding” set “Start value:” to 0 and “End value:” to 1
- You can improve the image quality by adding the “Ambient occlusion” modification

Pitfalls

Parallel Scalability

LAMMPS operates in parallel in a *spatial-decomposition mode*, where each processor owns a spatial subdomain of the overall simulation domain and communicates with its neighboring processors via distributed-memory message passing (MPI) to acquire ghost atom information to allow forces on the atoms it owns to be computed. LAMMPS also uses Verlet neighbor lists which are recomputed every few timesteps as particles move. On these timesteps, particles also migrate to new processors as needed. LAMMPS decomposes the overall simulation domain so that spatial subdomains of nearly equal volume are assigned to each processor. When each subdomain contains nearly the same number of particles, this results in a reasonable load balance among all processors. As is more typical with some peridynamic simulations, some subdomains may contain many particles while other subdomains contain few particles, resulting in a load imbalance that impacts parallel scalability.

Setting the “skin” distance

The [neighbor](#) command with LAMMPS is used to set the so-called “skin” distance used when building neighbor lists. All atom pairs within a cutoff distance equal to the horizon δ plus the skin distance are stored in the list. Unexpected crashes in LAMMPS may be due to too small a skin distance. The skin should be set to a value such that δ plus the skin distance is larger than the maximum possible distance between two bonded particles. For example, if s_{00} is increased, the skin distance may also need to be increased.

“Lost” particles

All particles are contained within the “simulation box” of LAMMPS. The boundaries of this box may change with time, or not, depending on how the LAMMPS [boundary](#) command has been set. If a particle drifts outside the simulation box during the course of a simulation, it is called *lost*.

As an option of the [thermo_modify](#) command of LAMMPS, the `lost` keyword determines whether LAMMPS checks for lost atoms each time it computes thermodynamics and what it does if atoms are lost. If the value is *ignore*, LAMMPS

Fig. 4: Screenshot of visualizing a trajectory with Ovito

does not check for lost atoms. If the value is *error* or *warn*, LAMMPS checks and either issues an error or warning. The code will exit with an error and continue with a warning. This can be a useful debugging option. The default behavior of LAMMPS is to exit with an error if a particle is lost.

The peridynamic module within LAMMPS does not check for lost atoms. If a particle with unbroken bonds is lost, those bonds are marked as broken by the remaining particles.

Defining the peridynamic horizon δ

In the *pair_coeff* command, the user must specify the horizon δ . This argument determines which particles are bonded when the simulation is initialized. It is recommended that δ be set to a small fraction of a lattice constant larger than desired.

For example, if the lattice constant is 0.0005 and you wish to set the horizon to three times the lattice constant, then set δ to be 0.0015001, a value slightly larger than three times the lattice constant. This guarantees that particles three lattice constants away from each other are still bonded. If δ is set to 0.0015, for example, floating point error may result in some pairs of particles three lattice constants apart not being bonded.

Breaking bonds too early

For technical reasons, the bonds in the simulation are not created until the end of the first timestep of the simulation. Therefore, one should not attempt to break bonds until at least the second step of the simulation.

Bugs

The user is cautioned that this code is a beta release. If you are confident that you have found a bug in the peridynamic module, please report it in a *GitHub Issue* <<https://github.com/lammps/lammps/issues>> or send an email to the LAMMPS developers. First, check the [New features and bug fixes](#) section of the LAMMPS website site to see if the bug has already been reported or fixed. If not, the most useful thing you can do for us is to isolate the problem. Run it on the smallest number of atoms and fewest number of processors and with the simplest input script that reproduces the bug. In your message, describe the problem and any ideas you have as to what is causing it or where in the code the problem might be. We'll request your input script and data files if necessary.

Modifying and Extending the Peridynamic Module

To add new features or peridynamic potentials to the peridynamic module, the user is referred to the [Modifying & extending LAMMPS](#) section. To develop a new bond-based material, start with the *peri/pmb* pair style as a template. To develop a new state-based material, start with the *peri/lps* pair style as a template.

A Numerical Example

To introduce the peridynamic implementation within LAMMPS, we replicate a numerical experiment taken from section 6 of ([Silling 2005](#)).

Problem Description and Setup

We consider the impact of a rigid sphere on a homogeneous disk of brittle material. The sphere has diameter 0.01 m and velocity 100 m/s directed normal to the surface of the target. The target material has density $\rho = 2200 \text{ kg/m}^3$. A PMB material model is used with $K = 14.9 \text{ GPa}$ and critical bond stretch parameters given by $s_{00} = 0.0005$ and $\alpha = 0.25$. A three-dimensional simple cubic lattice is constructed with lattice constant 0.0005 m and horizon 0.0015 m. (The horizon is three times the lattice constant.) The target is a cylinder of diameter 0.074 m and thickness 0.0025 m, and the associated lattice contains 103,110 particles. Each particle i has volume fraction $V_i = 1.25 \times 10^{-10} \text{ m}^3$.

The spring constant in the PMB material model is (see (6))

$$c = \frac{18k}{\pi\delta^4} = \frac{18(14.9 \times 10^9)}{\pi(1.5 \times 10^{-3})^4} \approx 1.6863 \times 10^{22}.$$

The CFL analysis from ([Silling2005](#)) shows that a timestep of 1.0×10^{-7} is safe.

We observe here that in IEEE double-precision floating point arithmetic when computing the bond stretch $s(t, \eta, \xi)$ at each iteration where $\|\eta + \xi\|$ is computed during the iteration and $\|\xi\|$ was computed and stored for the initial lattice, it may be that $fl(s) = \varepsilon$ with $|\varepsilon| \leq \varepsilon_{machine}$ for an unstretched bond. Taking $\varepsilon = 2.220446049250313 \times 10^{-16}$, we see that the value $csV_i \approx 4.68 \times 10^{-4}$, computed when determining f , is perhaps larger than we would like, especially when the true force should be zero. One simple way to avoid this issue is to insert the following instructions in Algorithm [Algorithm 5](#) after instruction 21 (and similarly for Algorithm [Algorithm 2](#)):

```

if  $|dr| < \varepsilon_{machine}$  then
     $dr = 0$ 
end if

```

Qualitatively, this says that displacements from equilibrium on the order of 10^{-16} m are taken to be exactly zero, a seemingly reasonable assumption.

The Projectile

The projectile used in the following experiments is not the one used in ([Silling 2005](#)). The projectile used here exerts a force

$$F(r) = -k_s(r - R)^2$$

on each atom where k_s is a specified force constant, r is the distance from the atom to the center of the indenter, and R is the radius of the projectile. The force is repulsive and $F(r) = 0$ for $r > R$. For our problem, the projectile radius $R = 0.05$ m, and we have chosen $k_s = 1.0 \times 10^{17}$ (compare with [\(6\)](#) above).

Writing the LAMMPS Input File

We discuss the example input script [listed below](#). In line 2 we specify that SI units are to be used. We specify the dimension (3) and boundary conditions (“shrink-wrapped”) for the computational domain in lines 3 and 4. In line 5 we specify that peridynamic particles are to be used for this simulation. In line 7, we set the “skin” distance used in building the LAMMPS neighbor list. In line 8 we set the lattice constant (in meters) and in line 10 we define the spatial region where the target will be placed. In line 12 we specify a rectangular box enclosing the target region that defines the simulation domain. Line 14 fills the target region with atoms. Lines 15 and 17 define the peridynamic material model, and lines 19 and 21 set the particle density and particle volume, respectively. The particle volume should be set to the cube of the lattice constant for a simple cubic lattice. Line 23 sets the initial velocity of all particles to zero. Line 25 instructs LAMMPS to integrate time with velocity-Verlet, and lines 27-30 create the spherical projectile, sending it with a velocity of 100 m/s towards the target. Line 32 declares a compute style for the damage (percentage of broken bonds) associated with each particle. Line 33 sets the timestep, line 34 instructs LAMMPS to provide a screen dump of thermodynamic quantities every 200 timesteps, and line 35 instructs LAMMPS to create a data file (`dump.peri`) with a complete snapshot of the system every 100 timesteps. This file can be used to create still images or movies. Finally, line 36 instructs LAMMPS to run for 2000 timesteps.

Note

To use the LPS model, replace line 15 with *pair_style peri/lps* and modify line 16 accordingly.

Numerical Results and Discussion

We ran the *input script from above*. Images of the disk (projectile not shown) appear in Figure below. The plot of damage on the top monolayer was created by coloring each particle according to its damage.

The symmetry in the computed solution arises because a “perfect” lattice was used, and a because a perfectly spherical projectile impacted the lattice at its geometric center. To break the symmetry in the solution, the nodes in the peridynamic body may be perturbed slightly from the lattice sites. To do this, the lattice of points can be slightly perturbed using the *displace_atoms* command.

10.5.11 Manifolds (surfaces)

Overview:

This page is not about a LAMMPS input script command, but about manifolds, which are generalized surfaces, as defined and used by the MANIFOLD package, to track particle motion on the manifolds. See the `src/MANIFOLD/README` file for more details about the package and its commands.

Below is a list of currently supported manifolds by the MANIFOLD package, their parameters and a short description of them. The parameters listed here are in the same order as they should be passed to the relevant fixes.

<i>manifold</i>	<i>parameters</i>	<i>equation</i>	<i>description</i>
cylinder	R	$x^2 + y^2 - R^2 = 0$	Cylinder along z-axis, axis going through (0,0,0)
cylinder_dent	R l a	$x^2 + y^2 - r(z)^2 = 0$, $r(x) = R$ if $ z > l$, $r(z) = R - a*(1 + \cos(z/l))/2$ otherwise	A cylinder with a dent around $z = 0$
dumbbell	a A B c	$-(x^2 + y^2) + (a^2 - z^2/c^2) * (1 + (A*\sin(B*z^2))^4) = 0$	A dumbbell
ellipsoid	a b c	$(x/a)^2 + (y/b)^2 + (z/c)^2 - 1 = 0$	An ellipsoid
gaussian_bump	A l rc1 rc2	if($x < rc1$) $-z + A * \exp(-x^2 / (2 l^2))$; else if($x < rc2$) $-z + a + b*x + c*x^2 + d*x^3$; else z	A Gaussian bump at $x = y = 0$, smoothly tapered to a flat plane $z = 0$.
plane	a b c x0 y0 z0	$a*(x-x0) + b*(y-y0) + c*(z-z0) = 0$	A plane with normal (a,b,c) going through point (x0,y0,z0)
plane_w	a w	$z - a*\sin(w*x) = 0$	A plane with a sinusoidal modulation on z along x.
sphere	R	$x^2 + y^2 + z^2 - R^2 = 0$	A sphere of radius R
supersphere	R q	$ x ^q + y ^q + z ^q - R^q = 0$	A supersphere of hyperradius R
spine	a, A, B, B2, c	$-(x^2 + y^2) + (a^2 - z^2/f(z)^2)*(1 + (A*\sin(g(z)*z^2))^4)$, $f(z) = c$ if $z > 0$, 1 otherwise; $g(z) = B$ if $z > 0$, B2 otherwise	An approximation to a dendritic spine
spine_t	a, A, B, B2, c	$-(x^2 + y^2) + (a^2 - z^2/f(z)^2)*(1 + (A*\sin(g(z)*z^2))^4)$, $f(z) = c$ if $z > 0$, 1 otherwise; $g(z) = B$ if $z > 0$, B2 otherwise	Another approximation to a dendritic spine
thylakoid	wB LB lB	Various, see (Paquay)	A model grana thylakoid consisting of two block-like compartments connected by a bridge of width wB, length LB and taper length lB
torus	R r	$(R - \sqrt{x^2 + y^2})^2 + z^2 - r^2 = 0$	A torus with large radius R and small radius r, centered on (0,0,0)

(**Paquay**) Paquay and Kusters, Biophys. J., 110, 6, (2016). preprint available at [arXiv:1411.3019](https://arxiv.org/abs/1411.3019).

10.5.12 Reproducing hydrodynamics and elastic objects (RHEO)

The RHEO package is a hybrid implementation of smoothed particle hydrodynamics (SPH) for fluid flow, which can couple to the *BPM package* to model solid elements. RHEO combines these methods to enable mesh-free modeling of multi-phase material systems. Its SPH solver supports many advanced options including reproducing kernels, particle shifting, free surface identification, and solid surface reconstruction. To model fluid-solid systems, the status of particles can dynamically change between a fluid and solid state, e.g. during melting/solidification, which determines how they interact and their physical behavior. The package is designed with modularity in mind, so one can easily turn various features on/off, adjust physical details of the system, or develop new capabilities. For instance, the numerics associated with calculating gradients, reproducing kernels, etc. are separated into distinct classes to simplify the development of new integration schemes which can call these calculations. Additional numerical details can be found in (*Palermo*) and (*Clemmer*). Example movies illustrating some of these capabilities are found at <https://www.lammps.org/movies.html#rheopackage>.

Note, if you simply want to run a traditional SPH simulation, the *SPH package* package is likely better suited for your application. It has fewer advanced features and therefore benefits from improved performance. The *MACHDYN* package for solids may also be relevant for fluid-solid problems.

At the core of the package is *fix rheo* which integrates particle trajectories and controls many optional features (e.g. the use of reproducing kernels). In conjunction to *fix rheo*, one must specify an instance of *fix rheo/pressure* and *fix rheo/viscosity* to define a pressure equation of state and viscosity model, respectively. Optionally, one can model a heat equation with *fix rheo/thermal*, which also allows the user to specify equations for a particle's thermal conductivity, specific heat, latent heat, and melting temperature. The ordering of these fixes in an input script matters. *Fix rheo* must be defined prior to all other RHEO fixes.

Typically, RHEO requires atom style *rheo*. In addition to typical atom properties like positions and forces, particles store a local density, viscosity, pressure, and status. If thermal evolution is modeled, one must use atom style *rheo/thermal* which also includes a local energy, temperature, and conductivity. Note that the temperature is always derived from the energy. This implies the *temperature* attribute of *the set command* does not affect particles. Instead, one should use the *sph/e* attribute.

The status variable uses bit-masking to track various properties of a particle such as its current state of matter (fluid or solid) and its location relative to a surface. Some of these properties (and others) can be accessed using *compute rheo/property/atom*. The *status* attribute in *the set command* only allows control over the first bit which sets the state of matter, 0 is fluid and 1 is solid.

Fluid interactions, including pressure forces, viscous forces, and heat exchange, are calculated using *pair rheo*. Unlike typical pair styles, *pair rheo* ignores the *special bond* settings. Instead, it determines whether to calculate forces based on the status of particles: e.g., hydrodynamic forces are only calculated if a fluid particle is involved.

To model elastic objects, there are currently two mechanisms in RHEO, one designed for bulk solid bodies and the other for thin shells. Both mechanisms rely on introducing bonded forces between particles and therefore require a hybrid of atom style *bond* and *rheo* (or *rheo/thermal*).

To create an elastic solid body, one has to (a) change the status of constituent particles to solid (e.g. with the *set* command), (b) create *bpm* bonds between the particles (see the *bpm howto* page for more details), and (c) use *pair rheo/solid* to apply repulsive contact forces between distinct solid bodies. Akin to *pair rheo*, *pair rheo/solid* considers a particle's fluid/solid phase to determine whether to apply forces. However, unlike *pair rheo*, *pair rheo/solid* does obey special bond settings such that contact forces do not have to be calculated between two bonded solid particles in the same elastic body.

In systems with thermal evolution, *fix rheo/thermal* can optionally set a melting/solidification temperature allowing particles to dynamically swap their state between fluid and solid when the temperature exceeds or drops below the critical temperature, respectively. Using the *react* option, one can specify a maximum bond length and a bond type. Then, when solidifying, particles search their local neighbors and automatically create bonds with any neighboring

solid particles in range. For BPM bond styles, bonds then use the immediate position of the two particles to calculate a reference state. When melting, particles delete any bonds of the specified type when reverting to a fluid state. Special bonds are updated as bonds are created/broken.

The other option for elastic objects is an elastic shell that is nominally much thinner than a particle diameter, e.g. a oxide skin which gradually forms over time on the surface of a fluid. Currently, this is implemented using *fix rheo/oxidation* and bond style *rheo/shell*. Essentially, *fix rheo/oxidation* creates candidate bonds of a specified type between surface fluid particles within a specified distance. a newly created *rheo/shell* bond will then start a timer. While the timer is counting down, the bond will delete itself if particles move too far apart or move away from the surface. However, if the timer reaches a user-defined threshold, then the bond will activate and apply additional forces to the fluid particles. Bond style *rheo/shell* then operates very similarly to a BPM bond style, storing a reference length and breaking if stretched too far. Unlike the above method, this option does not remove the underlying fluid interactions (although particle shifting is turned off) and does not modify special bond settings of particles.

While these two options are not expected to be appropriate for every system, either framework can be modified to create more suitable models (e.g. by changing the criteria for creating/deleting a bond or altering force calculations).

10.5.13 Magnetic spins

The magnetic spin simulations are enabled by the SPIN package, whose implementation is detailed in *Tranchida*.

The model represents the simulation of atomic magnetic spins coupled to lattice vibrations. The dynamics of those magnetic spins can be used to simulate a broad range a phenomena related to magneto-elasticity, or to study the influence of defects on the magnetic properties of materials.

The magnetic spins are interacting with each others and with the lattice via pair interactions. Typically, the magnetic exchange interaction can be defined using the *pair/spin/exchange* command. This exchange applies a magnetic torque to a given spin, considering the orientation of its neighboring spins and their relative distances. It also applies a force on the atoms as a function of the spin orientations and their associated inter-atomic distances.

The command *fix precession/spin* allows to apply a constant magnetic torque on all the spins in the system. This torque can be an external magnetic field (Zeeman interaction), and an uniaxial or cubic magnetic anisotropy.

A Langevin thermostat can be applied to those magnetic spins using *fix langevin/spin*. Typically, this thermostat can be coupled to another Langevin thermostat applied to the atoms using *fix langevin* in order to simulate thermostatted spin-lattice systems.

The magnetic damping can also be applied using *fix langevin/spin*. It allows to either dissipate the thermal energy of the Langevin thermostat, or to perform a relaxation of the magnetic configuration toward an equilibrium state.

The command *fix setforce/spin* allows to set the components of the magnetic precession vectors (while erasing and replacing the previously computed magnetic precession vectors on the atom). This command can be used to freeze the magnetic moment of certain atoms in the simulation by zeroing their precession vector.

The command *fix nve/spin* can be used to perform a symplectic integration of the combined dynamics of spins and atomic motions.

The minimization style *min/spin* can be applied to the spins to perform a minimization of the spin configuration.

All the computed magnetic properties can be output by two main commands. The first one is *compute spin*, that enables to evaluate magnetic averaged quantities, such as the total magnetization of the system along x, y, or z, the spin temperature, or the magnetic energy. The second command is *compute property/atom*. It enables to output all the per atom magnetic quantities. Typically, the orientation of a given magnetic spin, or the magnetic force acting on this spin.

(Tranchida) Tranchida, Plimpton, Thibaudau and Thompson, Journal of Computational Physics, 372, 406-425, (2018).

10.5.14 Adaptive-precision interatomic potentials (APIP)

The *PKG-APIP* enables use of adaptive-precision potentials as described in (Immel2025) and (Immel2026). In the context of this package, precision refers to the accuracy of an interatomic potential.

Modern machine-learning (ML) potentials translate the accuracy of DFT simulations into MD simulations, i.e., ML potentials are more accurate compared to traditional empirical potentials. However, this accuracy comes at a cost: there is a considerable performance gap between the evaluation of classical and ML potentials, e.g., the force calculation of a classical EAM potential is 100-1000 times faster compared to the ML-based ACE method. The evaluation time difference results in a conflict between large time and length scales on the one hand and accuracy on the other. This conflict is resolved by an APIP model for simulations, in which the highest precision is required only locally but not globally.

An APIP model uses a precise but expensive ML potential only for a subset of atoms, while a fast potential is used for the remaining atoms. Whether the precise or the fast potential is used is determined by a continuous switching parameter λ_i that can be defined for each atom i . The switching parameter can be adjusted dynamically during a simulation or kept constant as explained below.

The potential energy E_i of an atom i described by an adaptive-precision interatomic potential is given by (Immel2025)

$$E_i = \lambda_i E_i^{(\text{fast})} + (1 - \lambda_i) E_i^{(\text{precise})},$$

where $E_i^{(\text{fast})}$ is the potential energy of atom i according to a fast interatomic potential, $E_i^{(\text{precise})}$ is the potential energy according to a precise interatomic potential and $\lambda_i \in [0, 1]$ is the switching parameter that decides how the potential energies are weighted.

Adaptive-precision saves computation time when the computation of the precise potential is not required for many atoms, i.e., when $\lambda_i = 1$ applies for many atoms.

The currently implemented potentials are:

Fast potential	Precise potential
<i>ACE</i>	<i>ACE</i>
<i>EAM</i>	

In theory, any short-range potential can be used for an adaptive-precision interatomic potential. How to implement a new (fast or precise) adaptive-precision potential is explained in [here](#).

The switching parameter λ_i that combines the two potentials can be dynamically calculated during a simulation. There are two ways to calculate dynamic switching parameters.

1. according to (Immel2026) with a differentiable switching parameter that results in a conservative potential. Energy and momentum are (in the absence of external forces) conserved by design.
2. according to (Immel2025) with a non-differentiable switching parameter. In this case, the implementation can be optimized for performance by using the switching parameters of the previous timestep. Thereby, one can perform most of the switching-parameter calculation within the force-calculation routine and include this calculations in the load-balancing. The potential is not conservative and energy- and momentum-conservation are achieved through a local correction.

Alternatively, one can set a constant switching parameter before the start of a simulation. Using constant switching parameters results in a conservative potential.

To run a simulation with an adaptive-precision potential, one needs the following components:

i conservative dynamic switching parameter

1. *atom_style apip conservative* so that the switching parameter λ_i can be stored.
2. A fast potential: *eam/apip* or *pace/fast/apip*.
3. A precise potential: *pace/precise/apip*.
4. *fix lambda/la/csp/apip* to calculate a differentiable switching parameter λ_i .
5. *pair_style hybrid/overlay* to combine the previously mentioned pair_styles.
6. *fix atom_weight/apip* to approximate the load caused by every atom, as the computations of the pair_styles are only required for a subset of atoms.
7. *fix balance* to perform dynamic load balancing with the calculated load.

i dynamic switching parameter with correction

1. *atom_style apip* so that the switching parameter λ_i can be stored.
2. A fast potential: *eam/apip* or *pace/fast/apip*.
3. A precise potential: *pace/precise/apip*.
4. *pair_style lambda/input/apip* to calculate λ_i^{input} , from which λ_i is calculated.
5. *fix lambda/apip* to calculate the switching parameter λ_i .
6. *pair_style lambda/zone/apip* to calculate the spatial transition zone of the switching parameter.
7. *pair_style hybrid/overlay* to combine the previously mentioned pair_styles.
8. *fix lambda_thermostat/apip* to conserve the energy when switching parameters change.
9. *fix atom_weight/apip* to approximate the load caused by every atom, as the computations of the pair_styles are only required for a subset of atoms.
10. *fix balance* to perform dynamic load balancing with the calculated load.

i constant switching parameter

1. *atom_style apip* so that the switching parameter λ_i can be stored.
2. A fast potential: *eam/apip* or *pace/fast/apip*.
3. A precise potential: *pace/precise/apip*.
4. *set* command to set the switching parameter λ_i .
5. *pair_style hybrid/overlay* to combine the previously mentioned pair_styles.
6. *fix atom_weight/apip* to approximate the load caused by every atom, as the computations of the pair_styles are only required for a subset of atoms.
7. *fix balance* to perform dynamic load balancing with the calculated load.

Example

Note

How to select the values of the parameters of an adaptive-precision interatomic potential is discussed in detail in (Immel2025) and (Immel2026).

conservative dynamic switching parameter

Lines like these would appear in the input script:

```
atom_style apip conservative
comm_style tiled

pair_style hybrid/overlay eam/fs/apip pace/precise/apip
pair_coeff * * eam/fs/apip Cu.eam.fs Cu
pair_coeff * * pace/precise/apip Cu.yace Cu

# calculate a differentiable switching parameter to obtain
# a conservative potential
fix 2 all lambda/la/csp/apip 0.24 1.5 11.0 12.0 bcc

fix 4 all atom_weight/apip 100 eam ace 0 0 all

variable myweight atom f_4

fix 5 all balance 100 1.1 rcb weight var myweight
```

First, the *atom_style apip conservative* and the communication style are set.

Note

Note, that *comm_style tiled* is required for the style *rcb* of *fix balance*, but not for APIP. However, the flexibility offered by the balancing style *rcb*, compared to the balancing style *shift*, is advantageous for APIP.

A conservative adaptive-precision EAM-ACE potential is defined based on the differentiable switching parameter calculated by *fix lambda/la/csp/apip*, i.e., λ is calculated from the locally averaged CSP. The *pair_style hybrid/overlay* combines the fast EAM and the precise ACE potential, interpolated by the corresponding switching parameter. Furthermore, the *fix lambda/la/csp/apip* calculates the forces caused by the differentiation of the switching parameter. Thereby, one obtains a conservative potential ($\mathbf{F}_i = -\nabla_i \sum_k E_k$) that by design conserves energy and momentum in the absence of external forces.

The *fix 4* calculates the computational weight that is used by *fix 5* to balance the load between different processors.

i dynamic switching parameter with correction

Lines like these would appear in the input script:

```
atom_style apip
comm_style tiled

pair_style hybrid/overlay eam/fs/apip pace/precise/apip lambda/input/csp/apip fcc_
→cutoff 5.0 lambda/zone/apip 12.0
pair_coeff * * eam/fs/apip Cu.eam.fs Cu
pair_coeff * * pace/precise/apip Cu.yace Cu
pair_coeff * * lambda/input/csp/apip
pair_coeff * * lambda/zone/apip

fix 2 all lambda/apip 2.5 3.0 time_averaged_zone 4.0 12.0 110 110 min_delta_lambda_
→0.01
fix 3 all lambda_thermostat/apip N_rescaling 200
fix 4 all atom_weight/apip 100 eam ace lambda/input lambda/zone all

variable myweight atom f_4

fix 5 all balance 100 1.1 rcb weight var myweight
```

First, the *atom_style apip* and the communication style are set.

i Note

Note, that *comm_style tiled* is required for the style *rcb* of *fix balance*, but not for APIP. However, the flexibility offered by the balancing style *rcb*, compared to the balancing style *shift*, is advantageous for APIP.

An adaptive-precision EAM-ACE potential, for which the switching parameter λ is calculated from the CSP, is defined via *pair_style hybrid/overlay*. The fixes ensure that the switching parameter is calculated, the energy conserved, the weight for the load balancing calculated and the load-balancing itself is done.

i constant switching parameter

Lines like these would appear in the input script:

```
atom_style apip
comm_style tiled

pair_style hybrid/overlay eam/fs/apip pace/precise/apip
pair_coeff * * eam/fs/apip Cu.eam.fs Cu
pair_coeff * * pace/precise/apip Cu.yace Cu

# calculate lambda somehow
variable lambda atom ...
set group all apip/lambda v_lambda

fix 4 all atom_weight/apip 100 eam ace lambda/input lambda/zone all

variable myweight atom f_4

fix 5 all balance 100 1.1 rcb weight var myweight
```

First, the *atom_style apip* and the communication style are set.

i Note

Note, that *comm_style tiled* is required for the style *rcb* of *fix balance*, but not for APIP. However, the flexibility offered by the balancing style *rcb*, compared to the balancing style *shift*, is advantageous for APIP.

An adaptive-precision EAM-ACE potential is defined via *pair_style hybrid/overlay*. The switching parameter λ_i of the adaptive-precision EAM-ACE potential is set via the *set command*. The parameter is not updated during the simulation. Therefore, the potential is conservative. The fixes ensure that the weight for the load balancing is calculated and the load-balancing itself is done.

Implementing new APIP pair styles

One can introduce adaptive-precision to an existing pair style by modifying the original pair style. One should calculate the force $F_i = -\nabla_i \sum_j E_j^{\text{original}}$ for a fast potential or $F_i = -(1 - \nabla_i) \sum_j E_j^{\text{original}}$ for a precise potential from the original potential energy E_j^{original} to see where the switching parameter λ_i needs to be introduced in the force calculation. The switching parameter λ_i is known for all atoms i in force calculation routine. One needs to introduce an abortion criterion based on λ_i to ensure that all not required calculations are skipped and compute time can be saved. Furthermore, one needs to provide the number of calculations and measure the computation time. Communication within the force calculation needs to be prevented to allow effective load-balancing. With communication, the load balancer cannot balance few calculations of the precise potential on one processor with many computations of the fast potential on another processor.

All changes in the pair_style *pace/apip* compared to the pair_style *pace* are annotated and commented. Thus, the pair_style *pace/apip* can serve as an example for the implementation of new adaptive-precision potentials.

10.5.15 Local Density Dependent Potentials via LDD

- *Overview*
- *Local Density Definitions*
- *Local Density/ Square Gradient Potentials*
- *Input File Examples*
 - *Example 1) A simple atomic input example using only tabulated LD potentials*
 - *Example 2) Molecular input example that layers tabulated pair, LD and SG interactions via pair_style hybrid*
- *read_data file format*
- *Outputting the local-density data*
- *When to use LD/SG potentials:*

Overview

The *LDD pair style* in the BOCS package implements potentials that are a function of the local density, $\rho_{\beta|I}$, of type β particles around a central particle, I . There are two types of local density dependent potentials implemented. There are Local Density (LD) potentials U_{LD} , which are direct functions of $\rho_{\beta|I}$. There are also Square Gradient (SG) potentials U_{SG} . SG potentials use a direct function of the local density, $U_{\nabla}(\rho_{\beta|I})$, as a coefficient of the square gradient, $|\frac{\partial \rho_{\beta|I}}{\partial R_I}|^2$ of a particular local density. Such potentials are useful for coarse grained models and can be parameterized from trajectory data using [BOCS version 5 and higher](#).

Local Density Definitions

Each site (atom) in a molecular dynamics simulation I is assigned a type t_I . These site types may be labeled e.g. α , β , ..., etc. The local density, $\rho_{\beta|I}$, of β particles around a central particle, I , of type $t_I = \alpha$ is defined:

$$\rho_{\beta|I} = \sum_{J \in S_{\beta|I}} \bar{w}_{\beta|\alpha}(r_{IJ})$$

where $S_{\beta|I}$ is the set of particles of type β that are not excluded from pairwise interactions involving site I . $\bar{w}_{\beta|\alpha}(r_{IJ})$ is a normalized indicator function, it determines the pair weighted contribution from each particle J , of type $t_J = \beta$ to the β local density around a central particle I of type $t_I = \alpha$.

The normalized indicator function is defined by dividing a continuous/differentiable non-negative non-increasing indicator function $w(r)$ by its spatial integral $[w]$. Therefore, $\bar{w}(r)$ is defined for each $\beta|\alpha$ pair as:

$$\bar{w}(r) = \frac{w(r)}{[w]} \theta(r - r_c)$$

$$[w] = \int_0^{r_c} 4\pi r^2 w(r) dr$$

where θ is the Heaviside function, r_c is the local density length-scale, and $\bar{w}(r)$ is defined such that $\bar{w}(r) = 0$, if $r > r_c$. The local density of β particles that surround a given particle I is defined by the sum of contributions from β particles that are within ($\leq$) the cutoff r_c . The choice of indicator function is specified by the user in the *indicator* argument of the *ldd pair_coeff* command. Different options are listed under different pages indexed on the [pair ldd](#) page. Note that the weighting function and its length-scale can be defined independently for each pair of site types.

If particle I is of type $t_I = \beta$, its contribution to the local density $\rho_{t_I|I}$ can be included or excluded from the sum without changing the net force on a pair of particles. Practically, the only difference is a horizontal shift in the argument of the LD potential function $U_{\beta|\beta}(\rho)$. Whether or not to include this contribution is set by the user in the `ldd pair_coeff` command via the `self yes` or `self no` arguments.

For molecular systems, particles included in the local density around a given particle I are identified by the neighbor list for the non-bonded interactions. That is, a particle excluded by the neighbor list for a central particle will also be excluded from the sum defining its local density.

For example, consider a 5 bead chain that is simulated with default 1-2, 1-3, and 1-4 non-bonded exclusions:

$A_1 - B_2 - C_3 - D_4 - E_5$

The local density of particles of type E surrounding site 1, $\rho_{E|1}$ will include the contribution from the end chain particle $\bar{w}_{E|A}(r_{15})$. Conversely, the local density of particles of type B surrounding site 1, $\rho_{B|1}$ will only include intermolecular contributions to the local density. Whether or not the local density of A particles surrounding site 1, $\rho_{A|1}$, will include the `self` intramolecular contribution $\bar{w}_{A|A}(0)$ is determined by whether `self yes` or `self no` is listed as an argument by the user in the `ldd pair_coeff` command.

The choice of local density definition used for a particular interaction between types, $\beta|\alpha$ is set by the user via the `ldd pair_coeff` command with the different available options for indicator functions. Note, that the weighting function, $\bar{w}_{\beta|\alpha}$, and local density potential, $U_{\beta|\alpha}$ are not symmetric with respect to α and β . For instance, if $\alpha = v$ corresponds to solvents and $\beta = u$ corresponds to solutes, then the package allows the user to specify distinct weighting functions, $\bar{w}_{v|u} \neq \bar{w}_{u|v}$ and distinct LD potentials $U_{v|u} \neq U_{u|v}$, for treating solvent around solute and solute around solvent respectively.

Local Density/ Square Gradient Potentials

The LDD pair style implements forces for two kinds of local density dependent potentials.

LD (Local Density) potentials are defined:

$$U_{LD}(\mathbf{R}) = \sum_I \sum_{\beta} U_{\beta|t_I}(\rho_{\beta|I}),$$

where the first sum is over all sites, I , and the second sum is over all site types, β . The form of $U_{\beta|\alpha}$ is specified by the user in the `ldd pair_coeff` command using the `potential` keyword. For instance, $U_{\beta|\alpha}(\rho_{\beta|I})$ can be defined as zero (`noforce`) or as a `constant`, `linear`, or `quadratic` function of the local density. Alternatively, $U_{\beta|\alpha}(\rho_{\beta|I})$ can be specified by a table of values using the `table/lin` or `table/spline` keywords. Additionally the `potential` arg `mdpd` is a quadratic function in local density that can be combined with the `dpd pair_style` to simulate pairwise mdpd interactions in the LD framework. All of these forms are documented on the [pair_style ldd](#) page.

SG (Square Gradient) potentials are defined:

$$U_{SG}(\mathbf{R}) = \sum_I \sum_{\beta} U_{\nabla;\beta|t_I}(\rho_{\beta|I}) |\nabla_I \rho_{\beta|I}|^2$$

where the first sum is over all sites, I , the second sum is over all site types, β and the gradient $\nabla_I = \frac{\partial}{\partial \mathbf{R}_I}$ is evaluated with respect to the position of particle I . The form of the coefficient, $U_{\nabla;\beta|t_I}$, is specified by the user in the `ldd pair_coeff` command using the (optional) `gradient` keyword. Many of the available functional forms for the LD potential are also available for the SG coefficients, see [pair_ldd](#) for details.

For any given site I , once the local densities $\rho_{\beta|I}$ and the gradients of the local density $\nabla_I \rho_{\beta|I}$ have been determined, the corresponding forces are pairwise decomposable with pair forces analogous to those stated in [Delyser 2021](#) and [Delyser 2019](#).

The per-atom local densities and gradients are owned by the *ldd* pair style itself (recomputed every step, not stored in data or restart files); no special atom style is required, and the data is exposed to the rest of LAMMPS through *fix pair* (see the *pair ldd* page).

Interactions are specified per *species* pair. The potential file defines a set of species and the *pair_coeff * * file*. *ldd S1 S2 ...* command maps each atom type to a species (several types may map to the same species). Each of the N_{species}^2 ordered species pairs is given on its own line. In particular, the entry *A B* specifies the interaction for atoms of species A surrounded by atoms of species B, and is distinct from *B A*, the interaction for species B surrounded by species A. This “surrounded by” convention (*A B*) corresponds to the local density often written as *B|A* (species B given a central particle of species A) in published works.

Input File Examples

Example 1) A simple atomic input example using only tabulated LD potentials

The input script uses a plain atomic atom style and maps the two atom types to species A and B from the potential file:

```
## Init system/units
units real
dimension 3
atom_style atomic

newton on
timestep 1

read_data my_mix.data
velocity all create 300.0 22345 dist gaussian

## pair_style ldd takes no cutoff (it comes from each indicator rc)
pair_style ldd
pair_coeff * * my_mix.ldb A B # atom type 1 -> species A, type 2 -> species B

## Run / Output
run_style verlet
neigh_modify delay 5 every 1 check yes
neighbor 2.0 bin
thermo 500

fix 1 all nvt temp 300.0 300.0 100.0
# expose the per-atom local densities (one column per species) + total energy
fix lddout all pair 1 ldd local_density 0 total_energy 0
dump 1 all custom 500 dump.txt id x y z f_lddout[*]
dump_modify 1 sort id

run 10000
```

with the potential file *my_mix.ldb*:

```
# all four ordered species pairs must be listed (use "ignore" for none)
A A indicator dpd 0.0 6.5 self yes potential table/lin LD_table.1.1.dat
A B ignore
B A indicator dpd 0.0 5.5 self no potential table/lin LD_table.2.1.dat
B B indicator dpd 0.0 5.5 self yes potential table/lin LD_table.2.2.dat
```

Note in the above example, only species pairs A|A, A|B, and B|B interact according to LD potentials (the A B entry, corresponding to B|A, is ignored).

Example 2) Molecular input example that layers tabulated pair, LD and SG interactions via *pair_style hybrid*

The molecular topology uses the ordinary *full* atom style; the *ldd* interactions are layered in with *pair_style hybrid/overlay*:

```
## Initialize system /units

units real
dimension 3
atom_style full

newton on
timestep 1

bond_style harmonic

region my_box block 0 40 0 40 0 40
create_box 2 my_box bond/types 1 extra/bond/per/atom 1

mass 1 59.044
mass 2 59.044

pair_style hybrid/overlay ldd table spline 3000

molecule DI DIMER.mol
create_atoms 0 random 250 885401 my_box mol DI 454353

include ff_bonded_params.lammps
velocity all create 300.0 22345 dist gaussian

## Pair styles
pair_coeff * * table lammps_nb_ALL.table nb_All 15.0
pair_coeff * * ldd dimer.ldb A B # type 1 -> species A, type 2 -> species B

## Run / Output
run_style verlet
neigh_modify delay 5 every 1 check yes
neighbor 2.0 bin
thermo 500

fix 1 all nvt temp 300.0 300.0 100.0
run 10000
```

with the potential file dimer.ldb:

```
A A indicator lucy 0.0 6.5 self no potential table/spline LD.1.1.dat gradient table/
->gradspline SG.1.1.dat
A B indicator lucy 0.0 6.5 self no potential table/spline LD.1.2.dat
B A indicator lucy 0.0 6.5 self no potential table/spline LD.2.1.dat
B B indicator lucy 0.0 6.5 self no potential table/spline LD.2.2.dat gradient table/
```

(continues on next page)

(continued from previous page)

```
→gradspline SG.2.2.dat
```

Note in the above example LD cross interactions are both specified, but not necessarily symmetric. Also in this example, the cross interactions opt not to use the optional *gradient* keyword. Conversely the like-species interactions (A|A, B|B) layer SG potentials on top of the already defined LD and pair interactions.

See `examples/PACKAGES/bocs` for full input files for a 4-site chain example (topology like A-B-C-D).

See `pair_style ldd` for all `pair_coeff args` options that exist, all restrictions, and more examples.

read_data file format

The `ldd` pair style does not require a special atom style: the local densities, their gradients, and the associated energies are owned by the pair style and recomputed every step, so they are never read from or written to a data file. The `read_data` input therefore follows the usual format for whatever atom style you choose, e.g. *atomic* for a simple system or *full* for a molecular one.

Outputting the local-density data

For each central particle I and each species β , there is a local density of β particles that surround I , $\rho_{\beta|I}$, and a corresponding gradient $\frac{\partial \rho_{\beta|I}}{\partial R_I}$. These quantities (along with the per-species LD/SG energies and the per-atom total energy) are made available to the rest of LAMMPS through the `fix pair` command, which copies the chosen pair-style fields into a per-atom array. `pair_style ldd` describes the available options and quantities output.

For example:

```
fix lddout all pair 1 ldd local_density 0 grad_density 0 total_energy 0
dump 1 all custom 500 dump.txt id x y z vx vy vz fx fy fz f_lddout[*]
dump_modify 1 sort id
```

writes a custom trajectory that includes the local densities and their gradients alongside the usual positions, velocities, and forces (one column per species, three per species for the gradient). Such a trajectory can be used with the [Bottom-up Open-source Coarse-graining Software](#), which can parameterize LD/SG potentials from atomistic data and convert LAMMPS trajectories to `.trr` files for analysis with `gromacs` tools.

When to use LD/SG potentials:

This package has been primarily developed in the context of parameterizing/simulating bottom up coarse grained models. We have found that LD/SG potentials are particularly useful for supplementing pair potentials when simulating CG models in the NPT ensemble and in different interfacial environments. In particular, such potentials dramatically improve CG descriptions of the pressure-density equation of state, interfacial profiles, liquid-vapor coexistence, and transferability between bulk and interfacial systems. SG potentials are slower to simulate than LD potentials alone, so where applicable for coarse graining we recommend trying to construct/simulate LD potentials first and then [if necessary] adding SG potentials to refine further. CG force fields with LD and SG potentials can be parameterized via the multi-scale coarse graining method implemented in [BOCSv5](#) and [higher](#).

A number of works have been published using this package (with [BOCS](#)) in its development stage for different CG studies and are listed below:

10.6 Tutorials howto

10.6.1 Using CMake with LAMMPS

The support for building LAMMPS with CMake is a recent addition to LAMMPS thanks to the efforts of Christoph Junghans (LANL) and Richard Berger (LANL). One of the key strengths of CMake is that it is not tied to a specific platform or build system. Instead it generates the files necessary to build and develop for different build systems and on different platforms. Note, that this applies to the build system itself not the LAMMPS code. In other words, without additional porting effort, it is not possible - for example - to compile LAMMPS with Visual C++ on Windows. The build system output can also include support files necessary to program LAMMPS as a project in integrated development environments (IDE) like Eclipse, Visual Studio, QtCreator, Xcode, CodeBlocks, Kate and others.

A second important feature of CMake is that it can detect and validate available libraries, optimal settings, available support tools and so on, so that by default LAMMPS will take advantage of available tools without requiring to provide the details about how to enable/integrate them.

The downside of this approach is, that there is some complexity associated with running CMake itself and how to customize the building of LAMMPS. This tutorial will show how to manage this through some selected examples. Please see the chapter about *building LAMMPS* for descriptions of specific flags and options for LAMMPS in general and for specific packages.

Changed in version 10Sep2025.

CMake can be used through either the command-line interface (CLI) program `cmake` (or `cmake3`), a text mode interactive user interface (TUI) program `ccmake` (or `ccmake3`), or a graphical user interface (GUI) program `cmake-gui`. All of them are portable software available on all supported platforms and can be used interchangeably. Since LAMMPS version 10Sep2025, the minimum required CMake version is 3.20.

All details about features and settings for CMake are in the [CMake online documentation](#). We focus below on the most important aspects with respect to compiling LAMMPS.

Prerequisites

This tutorial assumes that you are operating in a command-line environment using a shell like Bash or Zsh.

- Linux: any Terminal window will work or text console
- macOS: launch the Terminal application
- Windows 10 or 11: install and run the *Windows Subsystem for Linux*
- other Unix-like operating systems like FreeBSD

i Note

It is also possible to use CMake on Windows 10 or 11 through either the Microsoft Visual Studio IDE with the bundled CMake or from the Windows command prompt using a separately installed CMake package, both using the native Microsoft Visual C++ compilers and (optionally) the Microsoft MPI SDK. This tutorial, however, only covers unix-like command-line interfaces.

We also assume that you have downloaded and unpacked a recent LAMMPS source code package or used Git to create a clone of the LAMMPS sources on your compilation machine.

You should change into the top level directory of the LAMMPS source tree all paths mentioned in the tutorial are relative to that. Immediately after downloading it should look like this:

```
$ ls
bench  doc      lib      potentials  README  tools
cmake  examples LICENSE  python     src
```

Build versus source directory

When using CMake the build procedure is separated into multiple distinct phases:

1. **Configuration:** detect or define which features and settings should be enable and used and how LAMMPS should be compiled
2. **Compilation:** generate and compile all necessary source files and build libraries and executables.
3. **Installation:** copy selected files from the compilation into your file system, so they can be used without having to keep the source and build tree around.

The configuration and compilation of LAMMPS has to happen in a dedicated *build directory* which must be different from the source directory. Also the source directory (`src`) must remain pristine, so it is not allowed to “install” packages using the traditional make process and after an compilation attempt all created source files must be removed. This can be achieved with `make no-all purge`.

You can pick **any** folder outside the source tree. We recommend to create a folder `build` in the top-level directory, or multiple folders in case you want to have separate builds of LAMMPS with different options (`build-parallel`, `build-serial`) or with different compilers (`build-gnu`, `build-clang`, `build-intel`) and so on. All the auxiliary files created by one build process (executable, object files, log files, etc) are stored in this directory or subdirectories within it that CMake creates.

Running CMake

CLI version

In the (empty) build directory, we now run the command `cmake ../cmake`, which will start the configuration phase and you will see the progress of the configuration printed to the screen followed by a summary of the enabled features, options and compiler settings. A typical summary screen will look like this:

```

$ cmake ../cmake/
-- The CXX compiler identification is GNU 8.2.0
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++ - works

```

The `cmake` command has one mandatory argument, and that is a folder with either the file `CMakeLists.txt` or `CMakeCache.txt`. The `CMakeCache.txt` file is created during the CMake configuration run and contains all active settings, thus after a first run of CMake all future runs in the build folder can use the folder `.` and CMake will know where to find the CMake scripts and reload the settings from the previous step. This means, that one can modify an existing configuration by re-running CMake, but only needs to provide flags indicating the desired change, everything else will be retained. One can also mix compilation and configuration, i.e. start with a minimal configuration and then, if needed, enable additional features and recompile.

The steps above **will NOT compile the code**. The compilation can be started in a portable fashion with `cmake --build ..` or you use the selected built tool, e.g. `make`.

TUI version

For the text mode UI CMake program the basic principle is the same. You start the command `ccmake ../cmake` in the `build` folder.

Fig. 6: Initial ccmake screen

Fig. 7: Configure output of cmake

Fig. 8: Options screen of cmake

This will show you the initial screen (left image) with the empty configuration cache. Now you type the ‘c’ key to run the configuration step. That will do a first configuration run and show the summary (center image). You exit the summary screen with ‘e’ and see now the main screen with detected options and settings. You can now make changes by moving and down with the arrow keys of the keyboard and modify entries. For on/off settings, the enter key will toggle the state. For others, hitting enter will allow you to modify the value and you commit the change by hitting the enter key again or cancel using the escape key. All “new” settings will be marked with a star “*” and for as long as one setting is marked like this, you have to re-run the configuration by hitting the ‘c’ key again, sometimes multiple times unless the TUI shows the word “generate” next to the letter ‘g’ and by hitting the ‘g’ key the build files will be written to the folder and the TUI exits. You can quit without generating build files by hitting ‘q’.

GUI version

For the graphical CMake program the steps are similar to the TUI version. You can type the command `cmake-gui` `../cmake` in the build folder. In this case the path to the CMake script folder is not required, it can also be entered from the GUI.

Fig. 9: Initial cmake-gui screen

Fig. 10: Generator selection in
cmake-guiFig. 11: Options screen of
cmake-gui

Again, you start with an empty configuration cache (left image) and need to start the configuration step. For the very first configuration in a folder, you will have a pop-up dialog (center image) asking to select the desired build tool and some configuration settings (stick with the default) and then you get the option screen with all new settings highlighted in red. You can modify them (or not) and click on the “configure” button again until satisfied and click on the “generate” button to write out the build files. You can exit the GUI from the “File” menu or hit “ctrl-q”.

Setting options

Options that enable, disable or modify settings are modified by setting the value of CMake variables. This is done on the command-line with the `-D` flag in the format `-D VARIABLE=value`, e.g. `-D CMAKE_BUILD_TYPE=Release` or `-D BUILD_MPI=on`. There is one quirk: when used before the CMake directory, there may be a space between the `-D` flag and the variable, after it must not be. Such CMake variables can have boolean values (on/off, yes/no, or 1/0 are all valid) or are strings representing a choice, or a path, or are free format. If the string would contain whitespace, it must be put in quotes, for example `-D CMAKE_CXX_FLAGS="-O3 -Wall -ftree-vectorize -ffast-math"`.

CMake variables fall into two categories: 1) common CMake variables that are used by default for any CMake configuration setup and 2) project specific variables, i.e. settings that are specific for LAMMPS. Also CMake variables can be flagged as *advanced*, which means they are not shown in the text mode or graphical CMake program in the overview of all settings by default, but only when explicitly requested (by hitting the ‘t’ key or clicking on the ‘Advanced’ check-box).

Some common CMake variables

Variable	Description
CMAKE_INSTALL_PREFIX	root directory of install location for <code>make install</code> (default: <code>\$HOME/.local</code>)
LAMMPS_INSTALL_RPATH	set or remove runtime path setting from binaries for <code>make install</code> (default: <code>off</code>)
CMAKE_BUILD_TYPE	controls compilation options: one of <code>RelWithDebInfo</code> (default), <code>Release</code> , <code>Debug</code> , <code>MinSizeRel</code>
BUILD_SHARED_LIBS	if set to <code>on</code> build the LAMMPS library as shared library (default: <code>off</code>)
CMAKE_MAKE_PROGRAM	name/path of the compilation command (default depends on <code>-G</code> option, usually <code>make</code>)
CMAKE_VERBOSE_MAKEFILE	if set to <code>on</code> echo commands while executing during build (default: <code>off</code>)
CMAKE_C_COMPILER	C compiler to be used for compilation (default: system specific, <code>gcc</code> on Linux)
CMAKE_CXX_COMPILER	C++ compiler to be used for compilation (default: system specific, <code>g++</code> on Linux)
CMAKE_Fortran_COMPILER	Fortran compiler to be used for compilation (default: system specific, <code>gfortran</code> on Linux)
CXX_COMPILER_LAUNCHER	tool to launch the C++ compiler, e.g. <code>ccache</code> or <code>distcc</code> for faster compilation (default: empty)

Some common LAMMPS specific variables

Variable	Description
BUILD_MPI	build LAMMPS with MPI support (default: on if a working MPI available, else off)
BUILD_OMP	build LAMMPS with OpenMP support (default: on if compiler supports OpenMP fully, else off)
BUILD_TOOLS	compile some additional executables from the <code>tools</code> folder (default: off)
BUILD_DOC	include building the HTML format documentation for packaging/installing (default: off)
LAMMPS_MACHIN	when set to name the LAMMPS executable and library will be called <code>lmp_name</code> and <code>liblammeps_name.a</code>
FFT	select which FFT library to use: FFTW3, MKL, KISS (default, unless FFTW3 is found)
FFT_KOKKOS	select which FFT library to use in Kokkos-enabled styles: FFTW3, MKL, HIPFFT, CUFFT, MKL_GPU, KISS (default)
FFT_SINGLE	select whether to use single precision FFTs (default: off)
WITH_JPEG	whether to support JPEG format in <i>dump image</i> (default: on if found)
WITH_PNG	whether to support PNG format in <i>dump image</i> (default: on if found)
WITH_GZIP	whether to support reading and writing compressed files (default: on if found)
WITH_FFMPEG	whether to support generating movies with <i>dump movie</i> (default: on if found)

Enabling or disabling LAMMPS packages

The LAMMPS software is organized into a common core that is always included and a large number of *add-on packages* that have to be enabled to be included into a LAMMPS executable. Packages are enabled through setting variables of the kind `PKG_<NAME>` to on and disabled by setting them to off (or using yes, no, 1, 0 correspondingly). `<NAME>` has to be replaced by the name of the package, e.g. MOLECULE or EXTRA-PAIR.

Using presets

Since LAMMPS has a lot of optional features and packages, specifying them all on the command-line can be tedious. Or when selecting a different compiler tool chain, multiple options have to be changed consistently and that is rather error prone. Or when enabling certain packages, they require consistent settings to be operated in a particular mode. For this purpose, we are providing a selection of “preset files” for CMake in the folder `cmake/presets`. They represent a way to pre-load or override the CMake configuration cache by setting or changing CMake variables. Preset files are loaded using the `-C` command-line flag. You can combine loading multiple preset files or change some variables later with additional `-D` flags. A few examples:

```
cmake -C ../cmake/presets/basic.cmake -D PKG_MISC=on ../cmake
cmake -C ../cmake/presets/clang.cmake -C ../cmake/presets/most.cmake ../cmake
cmake -C ../cmake/presets/basic.cmake -D BUILD_MPI=off ../cmake
```

The first command will install the packages KSPACE, MANYBODY, MOLECULE, RIGID, GRAPHICS, and MISC; the first five from the preset file and the sixth from the explicit variable definition. The second command will first switch the compiler tool chain to use the Clang compilers and install a large number of packages that are not depending on any special external libraries or tools and are not very unusual. The third command will enable the first four packages like above and then enforce compiling LAMMPS as a serial program (using the MPI STUBS library).

It is also possible to do this incrementally.

```
cmake -C ../cmake/presets/basic.cmake ../cmake
cmake -D PKG_MISC=on .
```

will achieve the same final configuration as in the first example above. In this scenario it is particularly convenient to do the second configuration step using either the text mode or graphical user interface (`ccmake` or `cmake-gui`).

Note

Using a preset to select a compiler package (`clang.cmake`, `gcc.cmake`, `intel.cmake`, `oneapi.cmake`, or `pgi.cmake`) are an exception to the mechanism of updating the configuration incrementally, as they will trigger a reset of cached internal CMake settings and thus reset settings to their default values.

Compilation and build targets

The actual compilation will be started by running the selected build command (on Linux this is by default `make`, see below how to select alternatives). You can also use the portable command `cmake --build .` which will adapt to whatever the selected build command is. This is particularly convenient, if you have set a custom build command via the `CMAKE_MAKE_PROGRAM` variable.

When calling the build program, you can also select which “target” is to be build through appending the `--target` flag and the name of the target to the build command. When using `make` as build tool, you can just append the target name to the command. Example: `cmake --build . --target all` or `make all`. The following abstract targets are available:

Target	Description
<code>all</code>	build “everything” (default)
<code>lammmps</code>	build the LAMMPS library and executable
<code>doc</code>	build the HTML documentation (if configured)
<code>install</code>	install all target files into folders in <code>CMAKE_INSTALL_PREFIX</code>
<code>test</code>	run some tests (if configured with <code>-D ENABLE_TESTING=on</code>)
<code>clean</code>	remove all generated files

Choosing generators

While CMake usually defaults to creating makefiles to compile software with the `make` program, it supports multiple alternate build tools (e.g. `ninja-build` which tends to be faster and more efficient in parallelizing builds than `make`) and can generate project files for integrated development environments (IDEs) like VisualStudio, Eclipse or CodeBlocks. This is specific to how the local CMake version was configured and compiled. The list of available options can be seen at the end of the output of `cmake --help`. Example on Fedora 31 this is:

Generators

The following generators are available on this platform (* marks default):

```
* Unix Makefiles           = Generates standard UNIX makefiles.
  Green Hills MULTI       = Generates Green Hills MULTI files
                           (experimental, work-in-progress).
  Ninja                   = Generates build.ninja files.
  Ninja Multi-Config      = Generates build-<Config>.ninja files.
  Watcom WMake            = Generates Watcom WMake makefiles.
  CodeBlocks - Ninja      = Generates CodeBlocks project files.
  CodeBlocks - Unix Makefiles = Generates CodeBlocks project files.
  CodeLite - Ninja        = Generates CodeLite project files.
  CodeLite - Unix Makefiles = Generates CodeLite project files.
  Sublime Text 2 - Ninja  = Generates Sublime Text 2 project files.
  Sublime Text 2 - Unix Makefiles
                           = Generates Sublime Text 2 project files.
  Kate - Ninja            = Generates Kate project files.
  Kate - Unix Makefiles   = Generates Kate project files.
```

(continues on next page)

(continued from previous page)

Eclipse CDT4 - Ninja = Generates Eclipse CDT 4.0 project files.
 Eclipse CDT4 - Unix Makefiles= Generates Eclipse CDT 4.0 project files.

Below is a screenshot of using the CodeBlocks IDE with the ninja build tool after running CMake as follows:

```
cmake -G 'CodeBlocks - Ninja' ../cmake/presets/most.cmake ../cmake/
```

10.6.2 LAMMPS GitHub tutorial

written by Stefan Paquay

This document describes the process of how to use GitHub to integrate changes or additions you have made to LAMMPS into the official LAMMPS distribution. It uses the process of updating this very tutorial as an example to describe the individual steps and options. You need to be familiar with git and you may want to have a look at the [git book](#) to familiarize yourself with some of the more advanced git features used below.

As of fall 2016, submitting contributions to LAMMPS via pull requests on GitHub is the preferred option for integrating contributed features or improvements to LAMMPS, as it significantly reduces the amount of work required by the LAMMPS developers. Consequently, creating a pull request will increase your chances to have your contribution included and will reduce the time until the integration is complete. For more information on the requirements to have your code included into LAMMPS please see [this page](#).

Making an account

First of all, you need a GitHub account. This is fairly simple, just go to [GitHub](#) and create an account by clicking the “Sign up for GitHub” button. Once your account is created, you can sign in by clicking the button in the top left and filling in your username or e-mail address and password.

Forking the repository

To get changes into LAMMPS, you need to first fork the *lammps/lammps* repository on GitHub. At the time of writing, *develop* is the preferred target branch. Thus go to [LAMMPS on GitHub](#) and make sure branch is set to “develop”, as shown in the figure below.

If it is not, use the button to change it to *develop*. Once it is, use the fork button to create a fork.

This will create a fork (which is essentially a copy, but uses less resources) of the LAMMPS repository under your own GitHub account. You can make changes in this fork and later file *pull requests* to allow the upstream repository to merge changes from your own fork into the one we just forked from (or others that were forked from the same repository). At the same time, you can set things up, so you can include changes from upstream into your repository and thus keep it in sync with the ongoing LAMMPS development.

Adding changes to your own fork

Additions to the upstream version of LAMMPS are handled using *feature branches*. For every new feature, a so-called feature branch is created, which contains only those modification relevant to one specific feature. For example, adding a single fix would consist of creating a branch with only the fix header and source file and nothing else. It is explained in more detail here: [feature branch workflow](#).

Feature branches

First of all, create a clone of your version on GitHub on your local machine via HTTPS:

```
git clone https://github.com/<your user name>/lammps.git <some name>
```

or, if you have set up your GitHub account for using SSH keys, via SSH:

```
git clone git@github.com:<your user name>/lammps.git
```

You can find the proper URL by clicking the “Clone or download”-button:

The above command copies (“clones”) the git repository to your local machine to a directory with the name you chose. If none is given, it will default to “lammps”. Typical names are “mylammps” or something similar.

You can use this local clone to make changes and test them without interfering with the repository on GitHub.

To pull changes from upstream into this copy, you can go to the directory and use git pull:

```
cd mylammps
git checkout develop
git pull https://github.com/lammps/lammps develop
```

You can also add this URL as a remote:

```
git remote add upstream https://www.github.com/lammps/lammps
```

From then on you can update your upstream branches with:

```
git fetch upstream
```

and then refer to the upstream repository branches with *upstream/develop* or *upstream/release* and so on.

At this point, you typically make a feature branch from the updated branch for the feature you want to work on. This tutorial contains the workflow that updated this tutorial, and hence we will call the branch “github-tutorial-update”:

```
git fetch upstream
git checkout -b github-tutorial-update upstream/develop
```

Now that we have changed branches, we can make our changes to our local repository. Just remember that if you want to start working on another, unrelated feature, you should switch branches!

Note

Committing changes to the *develop*, *release*, or *stable* branches is strongly discouraged. While it may be convenient initially, it will create more work in the long run. Various texts and tutorials on using git effectively discuss the motivation for using feature branches instead.

After changes are made

After everything is done, add the files to the branch and commit them:

```
git add doc/src/Howto_github.txt
git add doc/src/JPG/tutorial*.png
```

Warning

Do not use *git commit -a* (or *git add -A*). The *-a* flag (or *-A* flag) will automatically include **all** modified **and** new files and that is rarely the behavior you want. It can easily lead to accidentally adding unrelated and unwanted changes into the repository. Instead it is preferable to explicitly use *git add*, *git rm*, *git mv* for adding, removing, renaming individual files, respectively, and then *git commit* to finalize the commit. Carefully check all pending changes with *git status* before committing them. If you find doing this on the command-line too tedious, consider using a GUI, for example the one included in git distributions written in Tk, i.e. use *git gui* (on some Linux distributions it may be required to install an additional package to use it).

After adding all files, the change set can be committed with some useful message that explains the change.

```
git commit -m 'Finally updated the GitHub tutorial'
```

After the commit, the changes can be pushed to the same branch on GitHub:

```
git push
```

Git will ask you for your user name and password on GitHub if you have not configured anything. If your local branch is not present on GitHub yet, it will ask you to add it by running

```
git push --set-upstream origin github-tutorial-update
```

If you correctly type your user name and password, the feature branch should be added to your fork on GitHub.

If you want to make really sure you push to the right repository (which is good practice), you can provide it explicitly:

```
git push origin
```

or using an explicit URL:

```
git push git@github.com:Pakketeretet2/lammps.git
```

Filing a pull request

Up to this point in the tutorial, all changes were to *your* clones of LAMMPS. Eventually, however, you want this feature to be included into the official LAMMPS version. To do this, you will want to file a pull request by clicking on the “New pull request” button:

Your recently pushed branches:

 **github-tutorial-update** (less than a minute ago)

Branch: **github-tutoria...**

New pull request

This branch is 1 commit ahead of lammps:master.

 **Pakketeret2** Finally updated the github tutorial.

Make sure that the current branch is set to the correct one, which, in this case, is “github-tutorial-update”. If done correctly, the only changes you will see are those that were made on this branch.

This will open up a new window that lists changes made to the repository. If you are just adding new files, there is not much to do, but I suppose merge conflicts are to be resolved here if there are changes in existing files. If all changes can automatically be merged, green text at the top will say so and you can click the “Create pull request” button, see image.

Open a pull request

Create a new pull request by comparing changes across two branches. If you need to, you can also [compare across forks](#).

base fork: **lammps:master** base: **master** ... head fork: **Pakketeret2/lammps** compare: **github-tutorial-update**

✓ **Able to merge.** These branches can be automatically merged.

GitHub tutorial update

Write Preview AA B i “ < > ↻ ⋮ ≡ ✓ ↶ @

Leave a comment

Attach files by dragging & dropping or [selecting them](#).

✓ **Allow edits from maintainers.** [Learn more](#)

Create pull request

Before creating the pull request, make sure the short title is accurate and add a comment with details about your pull request. Here you write what your modifications do and why they should be incorporated upstream.

Note the checkbox that says “Allow edits from maintainers”. This is checked by default checkbox (although in my version of Firefox, only the checkmark is visible):

Attach files by dragging & dropping or [selecting them](#).

☒ **Allow edits from maintainers.** [Learn more](#)

Create pull request

If it is checked, maintainers can immediately add their own edits to the pull request. This helps the inclusion of your branch significantly, as simple/trivial changes can be added directly to your pull request branch by the LAMMPS maintainers. The alternative would be that they make changes on their own version of the branch and file a reverse pull request to you. Just leave this box checked unless you have a very good reason not to.

Now just write some nice comments and click on “Create pull request”.

 GitHub tutorial update

Write Preview AA B i “ <> 🔗 ⋮ ⋮ ⋮ ↶ @ *

Update to the Github tutorial with proper branch names etc.
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

Attach files by dragging & dropping or [selecting them](#).

☒ **Allow edits from maintainers.** [Learn more](#)

Create pull request

After filing a pull request

Note

When you submit a pull request (or ask for a pull request) for the first time, you will receive an invitation to become a LAMMPS project collaborator. Please accept this invite as being a collaborator will simplify certain administrative tasks and will probably speed up the merging of your feature, too.

You will notice that after filing the pull request, some checks are performed automatically:

GitHub tutorial update #315

Open Pakketeretet2 wants to merge 2 commits into `lammps:master` from `Pakketeretet2:github-tutorial-updat`

Conversation 0 Commits 2 Files changed 5

Pakketeretet2 commented a minute ago

Collaborator + 🗨️ ✎️

Update to the Github tutorial with proper branch names etc.
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

Pakketeretet2 added some commits 18 minutes ago

- Finally updated the github tutorial. 391ab76
- Almost done with the tutorial now. 4d98bbd

Add more commits by pushing to the `github-tutorial-update` branch on `Pakketeretet2/lammps`.

Some checks haven't completed yet

If all is fine, you will see this:

Add more commits by pushing to the `github-tutorial-update` branch on `Pakketeret2/lammps`.

All checks have passed [Show all checks](#)
3 successful checks

This pull request can be automatically merged by project collaborators
Only those with [write access](#) to this repository can merge pull requests.

[Merge pull request](#) You're not [authorized](#) to merge this pull request.

If any of the checks are failing, your pull request will not be processed, as your changes may break compilation for certain configurations or may not merge cleanly. It is your responsibility to remove the reason(s) for the failed test(s). If you need help with this, please contact the LAMMPS developers by adding a comment explaining your problems with resolving the failed tests.

A few further interesting things (can) happen to pull requests before they are included.

Additional changes

First of all, any additional changes you push into your branch in your repository will automatically become part of the pull request:

Pakketeret2 added some commits 2 days ago

- Finally updated the github tutorial. 391ab76
- Almost done with the tutorial now ✓ 4d98bbd
- Second update round to text and images, a third will follow after ✓ 2c7feal
- Small changes to tutorial text. 18b12ef

This means you can add changes that should be part of the feature after filing the pull request, which is useful in case you have forgotten them, or if a developer has requested that something needs to be changed before the feature can be accepted into the official LAMMPS version. After each push, the automated checks are run again.

Labels

LAMMPS developers may add labels to your pull request to assign it to categories (mostly for bookkeeping purposes), but a few of them are important: *needs_work*, *work_in_progress*, *run_tests*, *test_for_regression*, and *ready_for_merge*. The first two indicate, that your pull request is not considered to be complete. With “needs_work” the burden is on exclusively on you; while “work_in_progress” can also mean, that a LAMMPS developer may want to add changes. Please watch the comments to the pull requests. The two “test” labels are used to trigger extended tests before the code is merged. This is sometimes done by LAMMPS developers, if they suspect that there may be some subtle side effects from your changes. It is not done by default, because those tests are very time-consuming. The *ready_for_merge* label is usually attached when the LAMMPS developer assigned to the pull request considers this request complete and to trigger a final full test evaluation.

Reviews

As of Fall 2021, a pull request needs to pass all automatic tests and at least 1 approving review from a LAMMPS developer with write access to the repository before it is eligible for merging. In case your changes touch code that certain developers are associated with, they are auto-requested by the GitHub software. Those associations are set in the file `.github/CODEOWNERS`. Thus if you want to be automatically notified to review when anybody changes files or

packages, that **you** have contributed to LAMMPS, you can add suitable patterns to that file, or a LAMMPS developer may add you.

Otherwise, you can also manually request reviews from specific developers, or LAMMPS developers - in their assessment of your pull request - may determine who else should be reviewing your contribution and add that person. Through reviews, LAMMPS developers also may request specific changes from you. If those are not addressed, your pull requests cannot be merged.

Assignees

There is an assignee property for pull requests. If the request has not been reviewed by any developer yet, it is not assigned to anyone. After revision, a developer can choose to assign it to either a) you, b) a LAMMPS developer (including him/herself) or c) Axel Kohlmeyer (akohlmey).

- Case a) happens if changes are required on your part
- Case b) means that at the moment, it is being tested and reviewed by a LAMMPS developer with the expectation that some changes would be required. After the review, the developer can choose to implement changes directly or suggest them to you.
- Case c) means that the pull request has been assigned to the developer overseeing the merging of pull requests into the *develop* branch.

In this case, Axel assigned the tutorial to Steve:

Update to the LAMMPS tutorial with proper branch names etc.
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

Reverse pull requests

Sometimes, however, you might not feel comfortable having other people push changes into your own branch, or maybe the maintainers are not sure their idea was the right one. In such a case, they can make changes, reassign you as the assignee, and file a “reverse pull request”, i.e. file a pull request in **your** forked GitHub repository to include changes in the branch, that you have submitted as a pull request yourself. In that case, you can choose to merge their changes

back into your branch, possibly make additional changes or corrections and proceed from there. It looks something like this:

For some reason, the highlighted button did not work in my case, but I can go to my own repository and merge the pull request from there:

Be sure to check the changes to see if you agree with them by clicking on the tab button:

some formatting updates and text rewrites for your pull request #1

---	---

Because the changes are OK with us, we are going to merge by clicking on "Merge pull request". After a merge it looks like this:

Pakketeret2 commented 3 minutes ago

Thanks Axel, will merge after a review.

Pakketeret2 merged commit 1310438 into Pakketeret2:github-tutorial-update a minute ago

Avoid bugs by automatically running your tests.
Continuous integration can help catch bugs by running your tests automatically.
Merge your code with confidence using one of our continuous integration providers.

Now, since in the meantime our local text for the tutorial also changed, we need to pull Axel's change back into our branch, and merge them:

```
git add Howto_github.txt
git add JPG/tutorial_reverse_pull_request*.png
git commit -m "Updated text and images on reverse pull requests"
git pull
```

In this case, the merge was painless because git could auto-merge:

```
[ stefan@phys8250 src ] % git pull
Auto-merging doc/src/tutorial_github.txt
Waiting for Emacs...
Merge made by the 'recursive' strategy.
 doc/src/tutorial_github.txt | 68 ++++++-----
 1 file changed, 37 insertions(+), 31 deletions(-)
[ stefan@phys8250 src ] %
```

With Axel's changes merged in and some final text updates, our feature branch is now perfect as far as we are concerned, so we are going to commit and push again:

```
git add Howto_github.txt
git add JPG/tutorial_reverse_pull_request6.png
git commit -m "Merged Axel's suggestions and updated text"
git push git@github.com:Pakketeret2/lammps
```

This merge also shows up on the lammps GitHub page:

polish the introduction, some more clarifications, corrections and fo... 6af56e6

akohlmei referenced this pull request in Pakketeret2/lammps 2 hours ago
A few more suggested edits to the tutorial from me #2

akohlmei assigned sjplimp and unassigned Pakketeret2 2 hours ago

After a merge

When everything is fine, the feature branch is merged into the *develop* branch:

Now one question remains: What to do with the feature branch that got merged into upstream?

It is in principle safe to delete them from your own fork. This helps keep it a bit more tidy. Note that you first have to switch to another branch!

```
git checkout develop
git pull https://github.com/lammps/lammps develop
git branch -d github-tutorial-update
```

If you do not pull first, it is not really a problem but git will warn you at the next statement that you are deleting a local branch that was not yet fully merged into HEAD. This is because git does not yet know your branch just got merged into LAMMPS upstream. If you first delete and then pull, everything should still be fine. You can display all branches that are fully merged by:

Finally, if you delete the branch locally, you might want to push this to your remote(s) as well:

```
git push origin :github-tutorial-update
```

Recent changes in the workflow

Some recent changes to the workflow are not captured in this tutorial. For example, in addition to the *develop* branch, to which all new features should be submitted, there is also a *release*, a *stable*, and a *maintenance* branch; the *release* branch is updated from the *develop* branch as part of a “feature release”, and *stable* (together with *release*) are updated from *develop* when a “stable release” is made. In between stable releases, selected bug fixes and infrastructure updates are back-ported from the *develop* branch to the *maintenance* branch and occasionally merged to *stable* as an update release.

Furthermore, the naming of the release tags now follow the pattern “patch_<Day><Month><Year>” to simplify comparisons between releases. For stable releases additional “stable_<Day><Month><Year>” tags are applied and update releases are tagged with “stable_<Day><Month><Year>_update<Number>”. Finally, all releases and submissions are subject to automatic testing and code checks to make sure they compile with a variety of compilers and popular operating systems. Some unit and regression testing is applied as well.

A detailed discussion of the LAMMPS developer GitHub workflow can be found in the file [doc/github-development-workflow.md](#)

10.6.3 Using LAMMPS-GUI

Changed in version 10Sep2025.

This page used to contain the documentation for LAMMPS-GUI. LAMMPS-GUI, however, is no longer bundled with LAMMPS and its documentation has moved to <https://lammps-gui.lammps.org/>

10.6.4 Moltemplate Tutorial

In this tutorial, we are going to use the tool *Moltemplate* from <https://moltemplate.org/> to set up a classical molecular dynamic simulation using the *OPLS-AA force field*. The first task is to describe an organic compound and create a complete input deck for LAMMPS. The second task is to use moltemplate to build a polymer. The third task is to map the OPLS-AA force field to a molecular sample created with an external tool, e.g. PACKMOL, and exported as a PDB file. The files used in this tutorial can be found in the `tools/moltemplate/tutorial-files` folder of the LAMMPS source code distribution.

Many more examples can be found here: <https://moltemplate.org/examples.html>

Simulating an organic solvent

This example aims to create a cubic box of the organic solvent formamide.

The first step is to create a molecular topology in the LAMMPS-template (LT) file format representing a single molecule, which will be stored in a Moltemplate object called `_FAM inherits OPLSAA {}`. This command states that the object `_FAM` is based on an existing object called `OPLSAA`, which contains OPLS-AA parameters, atom type definitions, partial charges, masses and bond-angle rules for many organic and biological compounds. The atomic structure is the starting point to populate the command `write('Data Atoms') {}`, which will write the `Atoms` section in the LAMMPS data file. The OPLS-AA force field uses the `atom_style full`, therefore, this column format is used: `# atomID molID atomType charge coordX coordY coordZ`. The atomIDs are replaced with Moltemplate `$`-type variables, which are then substituted with unique numerical IDs. The same logic is applied to the `molID`, except that the same variable is used for the whole molecule. The atom types are assigned using `@`-type variables. The assignment of atom types (e.g. `@atom:177, @atom:178`) is done using the OPLS-AA atom types defined in the “In Charges” section of the file `oplsaa2024.lt`, looking for a reasonable match with the description of the atom. The resulting file (`formamide.lt`) follows:

```
import /usr/local/moltemplate/moltemplate/force_fields/oplsaa2024.lt # defines OPLSAA
_FAM inherits OPLSAA {
```

(continues on next page)

(continued from previous page)

```

# atomID      molID  atomType  charge  coordX  coordY  coordZ
write('Data Atoms') {
  $atom:C00  $mol  @atom:235  0.00    0.100  0.490  0.0
  $atom:O01  $mol  @atom:236  0.00    1.091 -0.250  0.0
  $atom:N02  $mol  @atom:237  0.00   -1.121 -0.181  0.0
  $atom:H03  $mol  @atom:240  0.00   -2.013  0.272  0.0
  $atom:H04  $mol  @atom:240  0.00   -1.056 -1.190  0.0
  $atom:H05  $mol  @atom:279  0.00    0.144  1.570  0.0
}

# A list of the bonds in the molecule:
# BondID  AtomID1  AtomID2
write('Data Bond List') {
  $bond:C1  $atom:C00  $atom:O01
  $bond:C2  $atom:C00  $atom:H05
  $bond:C3  $atom:C00  $atom:N02
  $bond:C4  $atom:N02  $atom:H03
  $bond:C5  $atom:N02  $atom:H04
}
}

```

You don't have to specify the charge in this example because the OPLSAA force-field assigns charge according to the atom type. (This is not true when using other force fields.) A "Data Bond List" section is needed as the atom type will determine the bond type. The other bonded interactions (e.g. angles, dihedrals, and impropers) will be automatically generated by Moltemplate.

If the simulation is not charge-neutral, or Moltemplate complains that you have missing bond, angle, or dihedral types, this probably means that at least one of your atom types is incorrect (or that perhaps there is no suitable atom type currently defined in the `oplsaa2024.lt` file).

The second step is to create a master file with instructions to build a starting structure and the LAMMPS commands to run an NPT simulation. The master file (`solv_01.lt`) follows:

```

import formamide.lt  # Defines "_FAM" and OPLSAA

# Distribute the molecules on a 5x5x5 cubic grid with spacing 4.6
solv = new _FAM [5].move( 4.6, 0, 0)
           [5].move( 0, 4.6, 0)
           [5].move( 0, 0, 4.6)
solv[*][*][*].move(-11.5, -11.5, -11.5)

# Set the simulation box.
write_once("Data Boundary") {
  -11.5 11.5 xlo xhi
  -11.5 11.5 ylo yhi
  -11.5 11.5 zlo zhi
}

# Note: The lines below in the "In Run" section are often omitted.

write_once("In Run"){
  # Create an input deck for LAMMPS.

```

(continues on next page)

(continued from previous page)

```

# Run an NPT simulation.
# Input variables.
variable run      string solv_01  # output name
variable ts       equal 1         # timestep
variable temp     equal 300       # equilibrium temperature
variable p        equal 1.        # equilibrium pressure
variable d        equal 1000      # output frequency
variable equi     equal 5000      # Equilibration steps
variable prod     equal 30000     # Production steps

# Derived variables.
variable tcouple  equal \${ts}*100
variable pcouple  equal \${ts}*1000

# Output.
thermo            \$d
thermo_style custom step etotal evdwl ecoul elong ebond eangle &
edihed eimp ke pe temp press vol density cpu
thermo_modify flush yes

# Trajectory.
dump TRJ all dcd \$d \${run}.dcd
dump_modify TRJ unwrap yes

# Thermalisation and relaxation, NPT ensemble.
timestep          \${ts}
fix               NPT all npt temp \${temp} \${temp} \${tcouple} iso \$p \$p \$\
→{pcouple}
velocity all create \${temp} 858096 dist gaussian
# Short runs to update the PPPM settings as the box shrinks.
run \${equi} post no
run \${equi} post no
run \${equi} post no
run \${equi}
# From now on, the density shouldn't change too much.
run \${prod}
unfix NPT
}

```

The first two commands insert the content of files `oplsaa2024.lt` and `formamide.lt` into the master file. At this point, we can use the command `solv = new _FAM [N]` to create N copies of a molecule of type `_FAM`. In this case, we create an array of 5*5*5 molecules on a cubic grid using the coordinate transformation command `.move( 4.6, 0, 0)`. See the Moltemplate documentation to learn more about the syntax. As the sample was created from scratch, we also specify the simulation box size in the “Data Boundary” section.

The LAMMPS setting for the force field are specified in the file `oplsaa2024.lt` and are written automatically in the input deck. We also specify the boundary conditions and a set of variables in the “In Init” section.

The remaining commands to run an NPT simulation are written in the “In Run” section. Note that in this script, LAMMPS variables are protected with the escape character `\` to distinguish them from Moltemplate variables, e.g. `\${run}` is a LAMMPS variable that is written in the input deck as `$_run`.

(Note: Moltemplate can be slow to run, so you need to change you run settings frequently, I recommended moving those commands (from “In Run”) out of your `.lt` files and into a separate file. Moltemplate creates a file named `run`.)

in.EXAMPLE for this purpose. You can put your run settings and fixes that file and then invoke LAMMPS using `mpirun -np 4 lmp -in run.in.EXAMPLE` instead.)

Compile the master file with:

```
moltemplate.sh solv_01.lt
cleanup_moltemplate.sh # <-- optional: see below
```

(Note: The optional “cleanup_moltemplate.sh” command deletes unused atom types, which sometimes makes LAMMPS run faster. But it does not work with many-body pair styles or dreiding-style h-bonds. Fortunately most force fields, including OPLSAA, don’t use those features.)

Then execute the simulation with the following:

```
mpirun -np 4 lmp -in solv_01.in -l solv_01.log
```

Fig. 12: Snapshot of the sample at the beginning and end of the simulation. Rendered with Ovito.

Building a simple polymer

Moltemplate is particularly useful for building polymers (and other molecules with sub-units). As an simple example, consider butane:

The `butane.lt` file below defines Butane as a polymer containing 4 monomers (of type CH3, CH2, CH2, CH3).

```
import /usr/local/moltemplate/moltemplate/force_fields/oplsaa2024.lt # defines OPLSAA

CH3 inherits OPLSAA {

  # atomID  molID  atomType  charge  coordX  coordY  coordZ
  write("Data Atoms") {
    $atom:c  $mol:... @atom:54  0.0    0.000000  0.4431163  0.000000
    $atom:h1  $mol:... @atom:60  0.0    0.000000  1.0741603  0.892431
    $atom:h2  $mol:... @atom:60  0.0    0.000000  1.0741603 -0.892431
    $atom:h3  $mol:... @atom:60  0.0   -0.892431 -0.1879277  0.000000
  }
  # (Using "$mol:..." indicates this object ("CH3") is part of a larger
  # molecule. Moltemplate will share the molecule-ID with that molecule.)
}
```

(continues on next page)

(continued from previous page)

```

# A list of the bonds within the "CH3" molecular sub-unit:
# BondID  AtomID1  AtomID2
write('Data Bond List') {
  $bond:ch1 $atom:c $atom:h1
  $bond:ch2 $atom:c $atom:h2
  $bond:ch3 $atom:c $atom:h3
}
}

CH2 inherits OPLSAA {

# atomID  molID  atomType  charge  coordX  coordY  coordZ
write("Data Atoms") {
  $atom:c  $mol:... @atom:57  0.0    0.000000  0.4431163  0.000000
  $atom:h1 $mol:... @atom:60  0.0    0.000000  1.0741603  0.892431
  $atom:h2 $mol:... @atom:60  0.0    0.000000  1.0741603 -0.892431
}

# A list of the bonds within the "CH2" molecular sub-unit:
# BondID  AtomID1  AtomID2
write('Data Bond List') {
  $bond:ch1 $atom:c $atom:h1
  $bond:ch2 $atom:c $atom:h2
}
}

Butane inherits OPLSAA {

```

(continues on next page)

(continued from previous page)

```

create_var {$mol} # optional:force all monomers to share the same molecule-ID

# - Create 4 monomers
# - Move them along the X axis using ".move()",
# - Rotate them 180 degrees with respect to the previous monomer
monomer1 = new CH3
monomer2 = new CH2.rot(180,1,0,0).move(1.2533223,0,0)
monomer3 = new CH2.move(2.5066446,0,0)
monomer4 = new CH3.rot(180,0,0,1).move(3.7599669,0,0)

# A list of the bonds connecting different monomers together:
write('Data Bond List') {
  $bond:b1 $atom:monomer1/c $atom:monomer2/c
  $bond:b2 $atom:monomer2/c $atom:monomer3/c
  $bond:b3 $atom:monomer3/c $atom:monomer4/c
}
}

```

Again, you don't have to specify the charge in this example because OPLSAA assigns charges according to the atom type.

This Butane object is a molecule which can be used anywhere other molecules can be used. (You can arrange Butane molecules on a lattice, as we did previously. You can also modify individual butane molecules by adding or deleting atoms or bonds. You can add bonds between specific butane molecules or use Butane as a sub-unit to define even larger molecules. See the moltemplate manual for details.)

How to build a complex polymer

A similar procedure can be used to create more complicated polymers, such as the NIPAM polymer example shown below. For details, see:

https://github.com/jewettaij/moltemplate/tree/master/examples/all_atom/force_field_OPLSAA/NIPAM_polymer+water+ions

Mapping an existing structure

Another helpful way to use Moltemplate is mapping an existing molecular sample to a force field. This is useful when a complex sample is assembled from different simulations or created with specialized software (e.g. PACKMOL). (Note: The previous link shows how to build this entire system from scratch using only moltemplate. However here we will assume instead that we obtained a PDB file for this system using PACKMOL.)

As in the previous examples, all molecular species in the sample are defined using single-molecule Moltemplate objects. For this example, we use a short polymer in a box containing water molecules and ions in the PDB file `model.pdb`.

It is essential to understand that the order of atoms in the PDB file and in the Moltemplate master script must match, as we are using the coordinates from the PDB file in the order they appear. The order of atoms and molecules in the PDB file provided is as follows:

- 500 water molecules, with atoms ordered in this sequence:

ATOM	1	O	MOL D	1	5.901	7.384	1.103	0.00	0.00	DUM
ATOM	2	H	MOL D	1	6.047	8.238	0.581	0.00	0.00	DUM
ATOM	3	H	MOL D	1	6.188	7.533	2.057	0.00	0.00	DUM

- 1 polymer molecule.
- 1 Ca²⁺ ion.

- 2 Cl⁻ ions.

In the master LT file, this sequence of molecules is matched with the following commands:

```
# Create the sample.
wat=new SPC[500]
pol=new PolyNIPAM[1]
cat=new Ca[1]
ani=new Cl[2]
```

Note that the first command would create 500 water molecules in the same position in space, and the other commands will use the coordinates specified in the corresponding molecular topology block. However, the coordinates will be overwritten by rendering an external atomic structure file. Note that if the same molecule species are scattered in the input structure, it is recommended to reorder and group together for molecule types to facilitate the creation of the input sample.

The molecular topology for the polymer is created as in the previous example, with the atom types assigned as in the following schema:

Fig. 13: Atom types assigned to the polymer's repeating unit.

The molecular topology of the water and ions is stated directly into the master file for the sake of space, but they could also be written in a separate file(s) and imported before the sample is created.

The resulting master LT file defining short annealing at a fixed volume (NVT) follows:

```
# Use the OPLS-AA force field for all species.
import /usr/local/moltemplate/moltemplate/force_fields/oplsaa2024.lt
import PolyNIPAM.lt

# Define the SPC water and ions as in the OPLS-AA
Ca inherits OPLSAA {
  write("Data Atoms"){
    $atom:a1 $mol:. @atom:412 0.0 0.000000 0.000000 0.000000
  }
}
Cl inherits OPLSAA {
  write("Data Atoms"){
    $atom:a1 $mol:. @atom:401 0.0 0.000000 0.000000 0.000000
  }
}
SPC inherits OPLSAA {
  write("Data Atoms"){
    $atom:O $mol:. @atom:9991 0. 0.00000000 0.000000 0.00000000
    $atom:H1 $mol:. @atom:9990 0. 0.8164904 0.000000 0.5773590
    $atom:H2 $mol:. @atom:9990 0. -0.8164904 0.000000 0.5773590
  }
  write("Data Bond List") {
```

(continues on next page)

(continued from previous page)

```

    $bond:OH1 $atom:O $atom:H1
    $bond:OH2 $atom:O $atom:H2
  }
}

# Create the sample.
wat=new SPC[500]
pol=new PolyNIPAM[1]
cat=new Ca[1]
ani=new Cl[2]

# Periodic boundary conditions:
write_once("Data Boundary"){
  0 26 xlo xhi
  0 26 ylo yhi
  0 26 zlo zhi
}

write_once("In Init"){
  boundary p p p # "p p p" is the default. This line is optional.
  neighbor 3 bin # (This line is also optional in this example.)
}

# Note: The lines below in the "In Run" section are often omitted.

# Run an NVT simulation.
write_once("In Run"){
  # Input variables.
  variable run      string sample01 # output name
  variable ts       equal 2          # timestep
  variable temp      equal 298.15    # equilibrium temperature
  variable p         equal 1.         # equilibrium pressure
  variable equi      equal 30000     # equilibration steps

  # Set the output.
  thermo 1000
  thermo_style custom step etotal evdwl ecoul elong ebond eangle &
  edihed eimp pe ke temp press atoms vol density cpu
  thermo_modify flush yes
  compute pe1 all pe/atom pair
  dump TRJ all custom 100 \${run\}.dump id xu yu zu c_pe1

  # Minimise the input structure, just in case.
  minimize .01 .001 1000 100000
  write_data \${run\}.min

  # Set the constraints.
  group watergroup type @atom:9991 @atom:9990
  fix 0 watergroup shake 0.0001 10 0 b @bond:spc0_spcH a @angle:spcH_spc0_spcH

  # Short annealing.
  timestep \${ts\}

```

(continues on next page)

(continued from previous page)

```

fix      1 all nvt temp \${temp}\ \${temp}\ \$(100*dt)
velocity all create \${temp}\ 315443
run      \${equi}\
unfix 1
}

```

In this example, the water model is SPC and it is defined in the `oplsaa2024.lt` file with atom types `@atom:9991` and `@atom:9990`. For water we also use the `group` and `fix shake` commands with Moltemplate @-type variables, to ensure consistency with the numerical values assigned during compilation. To identify the bond and angle types, look for the extended @atom IDs, which in this case are:

```

replace{ @atom:9991 @atom:9991_bspc0_aspc0_dspc0_ispc0 }
replace{ @atom:9990 @atom:9990_bspcH_aspcH_dspcH_ispcH }

```

From which we can identify the following “Data Bonds By Type”: `@bond:spc0_spcH @atom:*_bspc0*_a*_d*_i*` `@atom:*_bspcH*_a*_d*_i*` and “Data Angles By Type”: `@angle:spcH_spc0_spcH @atom:*_b*_aspcH*_d*_i*` `@atom:*_b*_aspc0*_d*_i*` `@atom:*_b*_aspcH*_d*_i*`

Compile the master file with:

```

moltemplate.sh -pdb model.pdb sample01.lt
cleanup_moltemplate.sh

```

And execute the simulation with the following:

```

mpirun -np 4 lmp -in sample01.in -l sample01.log

```

Overview

The `lammps` Python module is a wrapper class for the LAMMPS *C language library interface API* which is written using `Python ctypes`. The design choice of this wrapper class is to follow the C language API closely with only small changes related to Python specific requirements and to better accommodate object oriented programming.

In addition to this flat `ctypes` interface, the `lammps` wrapper class exposes a discoverable API that doesn't require as much knowledge of the underlying C language library interface or LAMMPS C++ code implementation.

Finally, the API exposes some additional features for *IPython integration* into *Jupyter notebooks*, e.g. for embedded visualization output from *dump style image*.

Quick Start

System-wide or User Installation

Step 1: Building LAMMPS as a shared library

To use LAMMPS inside of Python it has to be compiled as shared library. This library is then loaded by the Python interface. In this example we enable the *MOLECULE package* and compile LAMMPS with *PNG, JPEG and FFmpeg output support* enabled.

CMake build

```
mkdir $LAMMPS_DIR/build-shared
cd $LAMMPS_DIR/build-shared

# MPI, PNG, jpeg, FFmpeg are auto-detected
cmake ../cmake -DPKG_MOLECULE=yes -DPKG_PYTHON=on -DBUILD_SHARED_LIBS=yes
make
```

Traditional make

```
cd $LAMMPS_DIR/src

# add LAMMPS packages if necessary
make yes-MOLECULE
make yes-PYTHON
```

```
# compile shared library using Makefile
make mpi mode=shlib LMP_INC="-DLAMMPS_PNG -DLAMMPS_JPEG -DLAMMPS_FFMPEG" JPG_
↳LIB="-lpng -ljpeg"
```

Step 2: Installing the LAMMPS Python module

Next install the LAMMPS Python module into your current Python installation with:

```
make install-python
```

This will create a so-called “wheel” and then install the LAMMPS Python module from that “wheel” into either into a system folder (provided the command is executed with root privileges) or into your personal Python module folder.

Note

Recompiling the shared library requires re-installing the Python package.

Handling an “externally-managed-environment” Error

Some Python installations made through Linux distributions (e.g. Ubuntu 24.04LTS or later) will prevent installing the LAMMPS Python module into a system folder or a corresponding folder of the individual user as attempted by `make install-python` with an error stating that an *externally managed* python installation must be only managed by the same package management tool. This is an optional setting, so not all Linux distributions follow it currently (Spring 2025). The reasoning and explanations for this error can be found in the [Python Packaging User Guide](#)

These guidelines suggest to create a virtual environment and install the LAMMPS Python module there (see below). This is generally a good idea and the LAMMPS developers recommend this, too. If, however, you want to proceed and install the LAMMPS Python module regardless, you can install the “wheel” file (see above) manually with the `pip` command by adding the `--break-system-packages` flag.

Installation inside of a virtual environment

You can use virtual environments to create a custom Python environment specifically tuned for your workflow.

Benefits of using a virtualenv

- isolation of your system Python installation from your development installation
- installation can happen in your user directory without root access (useful for HPC clusters)
- installing packages through `pip` allows you to get newer versions of packages than e.g., through `apt-get` or `yum` package managers (and without root access)
- you can even install specific old versions of a package if necessary

Prerequisite (e.g. on Ubuntu)

```
apt-get install python-venv
```

Creating a virtualenv with lammmps installed

```
# create virtual envrionment named 'testing'
python3 -m venv $HOME/python/testing

# activate 'testing' environment
source $HOME/python/testing/bin/activate
```

Now configure and compile the LAMMPS shared library as outlined above. When using CMake and the shared library has already been build, you need to re-run CMake to update the location of the python executable to the location in the virtual environment with:

```
cmake . -DPython_EXECUTABLE=$(which python)

# install LAMMPS package in virtualenv
(testing) make install-python

# install other useful packages
(testing) pip install matplotlib jupyter mpi4py pandas

...

# return to original shell
(testing) deactivate
```

Creating a new lammmps instance

To create a lammmps object you need to first import the class from the lammmps module. By using the default constructor, a new *lammmps* instance is created.

```
from lammmps import lammmps
L = lammmps()
```

See the *LAMMPS Python documentation* for how to customize the instance creation with optional arguments.

Commands

Sending a LAMMPS command with the library interface is done using the `command` method of the `lammmps` object.

For instance, let's take the following LAMMPS command:

```
region box block 0 10 0 5 -0.5 0.5
```

This command can be executed with the following Python code if `L` is a `lammmps` instance:

```
L.command("region box block 0 10 0 5 -0.5 0.5")
```

For convenience, the `lammmps` class also provides a command wrapper `cmd` that turns any LAMMPS command into a regular function call:

```
L.cmd.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

Note that each parameter is set as Python number literal. With the wrapper each command takes an arbitrary parameter list and transparently merges it to a single command string, separating individual parameters by white-space.

The benefit of this approach is avoiding redundant command calls and easier parameterization. With the `command` function each call needs to be assembled manually using formatted strings.

```
L.command(f"region box block {xlo} {xhi} {ylo} {yhi} {zlo} {zhi}")
```

The wrapper accepts parameters directly and will convert them automatically to a final command string.

```
L.cmd.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

Note

When running in IPython you can use Tab-completion after `L.cmd.` to see all available LAMMPS commands.

Accessing atom data

All per-atom properties that are part of the *atom style* in the current simulation can be accessed using the `extract_atoms()` method. This can be retrieved as ctypes objects or as NumPy arrays through the `lammops.numpy` module. Those represent the *local* atoms of the individual sub-domain for the current MPI process and may contain information for the local ghost atoms or not depending on the property. Both can be accessed as lists, but for the ctypes list object the size is not known and has to be retrieved first to avoid out-of-bounds accesses.

```
nlocal = L.extract_setting("nlocal")
nall = L.extract_setting("nall")
print("Number of local atoms ", nlocal, "   Number of local and ghost atoms ", nall);

# access via ctypes directly
atom_id = L.extract_atom("id")
print("Atom IDs", atom_id[0:nlocal])

# access through numpy wrapper
atom_type = L.numpy.extract_atom("type")
print("Atom types", atom_type)

x = L.numpy.extract_atom("x")
v = L.numpy.extract_atom("v")
print("positions array shape", x.shape)
print("velocity array shape", v.shape)
# turn on communicating velocities to ghost atoms
L.cmd.comm_modify("vel", "yes")
v = L.numpy.extract_atom('v')
print("velocity array shape", v.shape)
```

Some properties can also be set from Python since internally the data of the C++ code is accessed directly:

```
# set position in 2D simulation
x[0] = (1.0, 0.0)

# set position in 3D simulation
x[0] = (1.0, 0.0, 1.)
```

Retrieving the values of thermodynamic data and variables

To access thermodynamic data from the last completed timestep, you can use the `get_thermo()` method, and to extract the value of (compatible) variables, you can use the `extract_variable()` method.

```
result = L.get_thermo("ke") # kinetic energy
result = L.get_thermo("pe") # potential energy

result = L.extract_variable("t") / 2.0
```

Error handling

We are using C++ exceptions in LAMMPS for errors and the C language library interface captures and records them. This allows checking whether errors have happened in Python during a call into LAMMPS and then re-throw the error as a Python exception. This way you can handle LAMMPS errors in the conventional way through the Python exception handling mechanism.

Warning

Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible.

Using LAMMPS in IPython notebooks and Jupyter

If the LAMMPS Python package is installed for the same Python interpreter as IPython, you can use LAMMPS directly inside of an IPython notebook inside of Jupyter. Jupyter is a powerful integrated development environment (IDE) for many dynamic languages like Python, Julia and others, which operates inside of any web browser. Besides auto-completion and syntax highlighting it allows you to create formatted documents using Markup, mathematical formulas, graphics and animations intermixed with executable Python code. It is a great format for tutorials and showcasing your latest research.

To launch an instance of Jupyter simply run the following command inside your Python environment (this assumes you followed the Quick Start instructions):

```
jupyter notebook
```

Interactive Python Examples

Examples of IPython notebooks can be found in the `python/examples/ipython` subdirectory. To open these notebooks launch `jupyter notebook` inside this directory and navigate to one of them. If you compiled and installed a LAMMPS shared library with PNG, JPEG and FFMPEG support you should be able to rerun all of these notebooks.

Validating a dihedral potential

This example showcases how an IPython Notebook can be used to compare a simple LAMMPS simulation of a harmonic dihedral potential to its analytical solution. Four atoms are placed in the simulation and the dihedral potential is applied on them using a datafile. Then one of the atoms is rotated along the central axis by setting its position from Python, which changes the dihedral angle.

```

phi = [d * math.pi / 180 for d in range(360)]

pos = [(1.0, math.cos(p), math.sin(p)) for p in phi]

x = L.numpy.extract_atom("x")

pe = []
for p in pos:
    x[3] = p
    L.cmd.run(0, "post", "no")
    pe.append(L.get_thermo("pe"))

```

By evaluating the potential energy for each position we can verify that trajectory with the analytical formula. To compare both solutions, we plot both trajectories over each other using matplotlib, which embeds the generated plot inside the IPython notebook.

In [11]: `L.image(zoom=1.0)`
 Out[11]:

In [14]: `L.image(zoom=1.0)`
 Out[14]:

In [27]: `plt.plot(range(360), pe, range(360), E_analytical)`
`plt.xlabel('angle')`
`plt.ylabel('E')`

Running a Monte Carlo relaxation

This second example shows how to use the *lammps* Python interface to create a 2D Monte Carlo Relaxation simulation, computing and plotting energy terms and even embedding video output.

Initially, a 2D system is created in a state with minimal energy.

It is then disordered by moving each atom by a random delta.

```
random.seed(27848)
deltaperturb = 0.2
x = L.numpy.extract_atom("x")
natoms = x.shape[0]

for i in range(natoms):
    dx = deltaperturb * random.uniform(-1, 1)
    dy = deltaperturb * random.uniform(-1, 1)
    x[i][0] += dx
    x[i][1] += dy

L.cmd.run(0, "post", "no")
```

Finally, the Monte Carlo algorithm is implemented in Python. It continuously moves random atoms by a random delta and only accepts certain moves.

```
estart = L.get_thermo("pe")
elast = elast

naccept = 0
energies = [estart]

niterations = 3000
deltamove = 0.1
kT = 0.05

for i in range(niterations):
    x = L.numpy.extract_atom("x")
    natoms = x.shape[0]
    iatom = random.randrange(0, natoms)
    current_atom = x[iatom]
```

(continues on next page)

(continued from previous page)

```
x0 = current_atom[0]
y0 = current_atom[1]

dx = deltamove \* random.uniform(-1, 1)
dy = deltamove \* random.uniform(-1, 1)

current_atom[0] = x0 + dx
current_atom[1] = y0 + dy

L.cmd.run(1, "pre no post no")

e = L.get_thermo("pe")
energies.append(e)

if e <= elast:
    naccept += 1
    elast = e
elif random.random() <= math.exp(natoms\*(elast-e)/kT):
    naccept += 1
    elast = e
else:
    current_atom[0] = x0
    current_atom[1] = y0
```

The energies of each iteration are collected in a Python list and finally plotted using matplotlib.

```
In [20]: plt.xlabel('iteration')
plt.ylabel('potential energy')
plt.plot(energies)
```

Figure 1

```
Out[20]: [<matplotlib.lines.Line2D at 0x7f26a40123c8>]
```

The IPython notebook also shows how to use dump commands and embed video files inside of the IPython notebook.

10.6.6 Using LAMMPS on Windows 10 with WSL

written by Richard Berger

It's always been tricky for us to have LAMMPS users and developers work on Windows. We primarily develop LAMMPS to run on Linux clusters. To teach LAMMPS in workshop settings, we had to redirect Windows users to Linux Virtual Machines such as VirtualBox or Unix-like compilation with Cygwin.

With the latest updates in Windows 10 (Version 2004, Build 19041 or higher), Microsoft has added a new way to work on Linux-based code. The [Windows Subsystem for Linux \(WSL\)](#). With WSL Version 2, you now get a Linux Virtual Machine that transparently integrates into Windows. All you need is to ensure you have the latest Windows updates installed and enable this new feature. Linux VMs are then easily installed using the Microsoft Store.

In this tutorial, I'll show you how to set up and compile LAMMPS for both serial and MPI usage in WSL2.

Installation

Upgrade to the latest Windows 10

Type “Updates” in Windows Start and select “Check for Updates”.

Install all pending updates and reboot your system as many times as necessary. Continue until your Windows installation is updated.

Verify your system has at least **version 2004 and build 19041 or later**. You can find this information by clicking on “OS build info”.

Enable WSL

Next, we must install two additional Windows features to enable WSL support. Open a PowerShell window as an administrator. Type “PowerShell” in Windows Start and select “Run as Administrator”.

Windows will ask you for administrator access. After you accept a new command line window will appear. Type in the following command to install WSL:

```
dism.exe /online /enable-feature /featurename:Microsoft-Windows-Subsystem-Linux /all /
↪norestart
```

Next, enable the VirtualMachinePlatform feature using the following command:

```
dism.exe /online /enable-feature /featurename:VirtualMachinePlatform /all /norestart
```

```

Administrator: Windows PowerShell
PS C:\WINDOWS\system32> dism.exe /online /enable-feature /featurename:VirtualMachinePlatform /all /norestart

Deployment Image Servicing and Management tool
Version: 10.0.19041.329

Image Version: 10.0.19041.388

Enabling feature(s)
[=====100.0%=====]
The operation completed successfully.
PS C:\WINDOWS\system32>

```

Finally, reboot your system.

Update WSL kernel component

Download and install the WSL Kernel Component Update. Afterwards, reboot your system.

Set WSL2 as default

Again, open PowerShell as administrator and run the following command:

```
wsl --set-default-version 2
```

This command ensures that all future Linux installations will use WSL version 2.

```

Administrator: Windows PowerShell
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

Try the new cross-platform PowerShell https://aka.ms/pscore6

PS C:\WINDOWS\system32> wsl --set-default-version 2
For information on key differences with WSL 2 please visit https://aka.ms/wsl2
PS C:\WINDOWS\system32>

```

Install a Linux Distribution

Next, we need to install a Linux distribution via the Microsoft Store. Install [Ubuntu 20.04 LTS](#). Once installed, you can launch it like any other application from the Start Menu.

Initial Setup

The first time you launch the Ubuntu Linux console, it will prompt you for a UNIX username and password. You will need this password to perform `sudo` commands later. Once completed, your Linux shell is ready for use. All your actions and commands will run as the Linux user you specified.

```
richard@luxo: ~
Retype new password:
passwd: password updated successfully
Installation successful!
To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

Welcome to Ubuntu 20.04 LTS (GNU/Linux 4.4.0-19041-Microsoft x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage

System information as of Fri Jul 17 13:51:44 EDT 2020

System load:  0.52   Processes:      7
Usage of /home: unknown   Users logged in:  0
Memory usage: 53%    IPv4 address for eth0: 10.0.2.15
Swap usage:   0%

0 updates can be installed immediately.
0 of these updates are security updates.

The list of available updates is more than a week old.
To check for new updates run: sudo apt update

This message is shown once once a day. To disable it please create the
/home/richard/.hushlogin file.
richard@luxo: ~$
```

Windows Explorer / WSL integration

Your Linux installation will have its own Linux filesystem, which contains the Ubuntu files. Your Linux user will have a regular Linux home directory in `/home/<USERNAME>`. This directory is different from your Windows User directory. Windows and Linux filesystems are connected through WSL.

All hard drives in Windows are accessible in the `/mnt` directory in Linux. E.g., WSL maps the C hard drive to the `/mnt/c` directory. That means you can access your Windows User directory in `/mnt/c/Users/<WINDOWS_USERNAME>`.

The Windows Explorer can also access the Linux filesystem. To illustrate this integration, open an Ubuntu console and navigate to a directory of your choice. To view this location in Windows Explorer, use the `explorer.exe .` command (do not forget the final dot!).

Compiling LAMMPS

You now have a fully functioning Ubuntu installation and can follow most guides to install LAMMPS on a Linux system. Here are some of the essential steps to follow:

Install prerequisite packages

Before we can begin, we need to download the necessary compiler tool chain and libraries to compile LAMMPS. In our Ubuntu-based Linux installation, we will use the `apt` package manager to install additional packages.

First, upgrade all existing packages using `apt update` and `apt upgrade`.

```
sudo apt update
sudo apt upgrade -y
```

Next, install the following packages with `apt install`:

```
sudo apt install -y cmake build-essential ccache gfortran openmpi-bin libopenmpi-dev \
libfftw3-dev libjpeg-dev libpng-dev python3-dev python3-pip \
python3-virtualenv libblas-dev liblapack-dev libhdf5-serial-dev \
hdf5-tools
```

Download LAMMPS

Obtain a copy of the LAMMPS source code and go into it using the `cd` command.

Option 1: Download a LAMMPS tarball using `wget`

```
wget https://github.com/lammps/lammps/archive/stable_3Mar2020.tar.gz
tar xvzf stable_3Mar2020.tar.gz
cd lammps
```

Option 2: Download a LAMMPS development version from GitHub

```
git clone --depth=1 https://github.com/lammps/lammps.git
cd lammps
```

Configure and Compile LAMMPS with CMake

A beginner-friendly way to compile LAMMPS is to use CMake. Create a build directory to compile LAMMPS and move into it. This directory will store the build configuration and any binaries generated during compilation.

```
mkdir build
cd build
```

There are countless ways to compile LAMMPS. It is beyond the scope of this tutorial. If you want to find out more about what can be enabled, please consult the extensive [documentation](#).

To compile a minimal version of LAMMPS, we're going to use a preset. Presets are a way to specify a collection of CMake options using a file.

```
cmake ../cmake/presets/basic.cmake ../cmake
```

This command configures the build and generates the necessary Makefiles. To compile the binary, run the `make` command.

```
make -j 4
```

The `-j` option specifies how many parallel processes will perform the compilation. This option can significantly speed up compilation times. Use a number that corresponds to the number of processors in your system.

After the compilation completes successfully, you will have an executable called `lmp` in the `build` directory.

Please take note of the absolute path of your build directory. You will need to know the location to execute the LAMMPS binary later.

One way of getting the absolute path of the current directory is through the `$PWD` variable:

```
# prints out the current value of the PWD variable
echo $PWD
```

Let us save this value in a temporary variable `LAMMPS_BUILD_DIR` for future use:

```
LAMMPS_BUILD_DIR=$PWD
```

The full path of the LAMMPS binary then is `$LAMMPS_BUILD_DIR/lmp`.

Running an example script

Now that we have a LAMMPS binary, we will run a script from the examples folder.

Switch into the `examples/melt` folder:

```
cd ../examples/melt
```

To run this example in serial, use the following command:

```
$LAMMPS_BUILD_DIR/lmp -in in.melt
```

To run the same script in parallel using MPI with 4 processes, do the following:

```
mpirun -np 4 $LAMMPS_BUILD_DIR/lmp -in in.melt
```

If you run LAMMPS for the first time, the Windows Firewall might prompt you to confirm access. LAMMPS is accessing the network stack to enable parallel computation. Allow the access.

In either serial or MPI case, LAMMPS executes and will output something similar to this:

```
LAMMPS (30 Jun 2020)
...
...
...
Total # of neighbors = 151513

```

Congratulations! You’ve successfully compiled and executed LAMMPS on WSL!

Final steps

It is cumbersome to always specify the path of your LAMMPS binary. You can avoid this by adding the absolute path of your build directory to your PATH environment variable.

```
export PATH=$LAMMPS_BUILD_DIR:$PATH
```

You can then run LAMMPS input scripts like this:

```
lmp -in in.melt
```

or

```
mpirun -np 4 lmp -in in.melt
```

Note

The value of this PATH variable will disappear once you close your console window. To persist this setting edit the \$HOME/.bashrc file using your favorite text editor and add this line:

```
export PATH=/full/path/to/your/lammps/build:$PATH
```

Example: If the LAMMPS executable *lmp* has the following absolute path:

```
/home/<USERNAME>/lammps/build/lmp
```

the PATH variable should be:

```
export PATH=/home/<USERNAME>/lammps/build:$PATH
```

Once set up, all your Ubuntu consoles will always have access to your *lmp* binary without having to specify its location.

Conclusion

I hope this gives you good overview on how to start compiling and running LAMMPS on Windows. WSL makes preparing and running scripts on Windows a much better experience.

If you are completely new to Linux, I highly recommend investing some time in studying Linux online tutorials. E.g., tutorials about Bash Shell and Basic Unix commands (e.g., [Linux Journey](#)). Acquiring these skills will make you much more productive in this environment.

EXAMPLE SCRIPTS

The LAMMPS distribution includes an examples subdirectory with many sample problems. Many are 2d models that run quickly and are straightforward to visualize, requiring at most a couple of minutes to run on a desktop machine. Each problem has an input script (in.*) and produces a log file (log.*) when it runs. Some use a data file (data.*) of initial coordinates as additional input. A few sample log file run on different machines and different numbers of processors are included in the directories to compare your answers to. E.g. a log file like log.date.crack.foo.P means the “crack” example was run on P processors of machine “foo” on that date (i.e. with that version of LAMMPS).

Many of the input files have commented-out lines for creating dump files and image files.

If you uncomment the *dump* command in the input script, a text dump file will be produced, which can be animated by various *visualization programs*.

If you uncomment the *dump image* command in the input script, and assuming you have built LAMMPS with a JPG library, JPG snapshot images will be produced when the simulation runs. They can be quickly post-processed into a movie using commands described on the *dump image* doc page.

Animations of many of the examples can be viewed on the Movies section of the *LAMMPS website*.

There are two kinds of subdirectories in the examples folder. Lower case named directories contain one or a few simple, quick-to-run problems. Upper case named directories contain up to several complex scripts that illustrate a particular kind of simulation method or model. Some of these run for longer times, e.g. to measure a particular quantity.

Lists of both kinds of directories are given below.

11.1 Lowercase directories

airebo	polyethylene with AIREBO potential
amoeba	small water and bio models with AMOEBA and HIPPO potentials
atm	Axilrod-Teller-Muto potential example
balance	dynamic load balancing, 2d system
body	body particles, 2d system
bpm	simulations of solid elastic/plastic deformation and fracture
cmap	CMAP 5-body contributions to CHARMM force field
colloid	big colloid particles in a small particle solvent, 2d system
comb	models using the COMB potential
controller	use of fix controller as a thermostat
coreshell	core/shell model using CORESHELL package
crack	crack propagation in a 2d solid

continues on next page

Table 1 – continued from previous page

deposit	deposit atoms and molecules on a surface
dipole	point dipolar particles, 2d system
dreiding	methanol via Dreiding FF
eim	NaCl using the EIM potential
ellipse	ellipsoidal particles in spherical solvent, 2d system
fire	examples for using minimization styles fire and quickmin
flow	Couette and Poiseuille flow in a 2d channel
friction	frictional contact of spherical asperities between 2d surfaces
gjf	examples for Gronbech-Jensen thermostats with large time step
granregion	use of fix wall/region/gran as boundary on granular particles
grid	use of commands which overlay grids on the simulation domain
hugoniosat	Hugoniosat shock dynamics
hyper	global and local hyperdynamics of diffusion on Pt surface
indent	spherical indenter into a 2d solid
kim	use of potentials from the OpenKIM Repository
mc	Monte Carlo features via fix gcmc, widom and other commands
mdi	use of the MDI package and MolSSI MDI code coupling library
meam	MEAM test for SiC and shear (same as shear examples)
melt	rapid melt of 3d LJ system
mesh	create_atoms mesh command examples
micelle	self-assembly of small lipid-like molecules into 2d bilayers
min	energy minimization of 2d LJ melt
mliap	examples for using several bundled ML-IAP potentials
msst	MSST shock dynamics
multi	multi neighboring for systems with large interaction disparities
nb3b	use of non-bonded 3-body harmonic pair style
neb	nudged elastic band (NEB) calculation for barrier finding
nemd	non-equilibrium MD of 2d sheared system
numdiff	get forces, virial, and Born matrix from numerical differences
obstacle	flow around two voids in a 2d channel
peptide	dynamics of a small solvated peptide chain (5-mer)
peri	Peridynamic model of cylinder impacted by indenter
pour	pouring of granular particles into a 3d box, then chute flow
prd	parallel replica dynamics of vacancy diffusion in bulk Si
python	using embedded Python in a LAMMPS input script
qeq	use of the QEQ package for charge equilibration
rdf-adf	computing radial and angle distribution functions for water
reaxff	RDX and TATB models and more using ReaxFF
replicate	use of replicate command

continues on next page

Table 1 – continued from previous page

rerun	use of rerun and read_dump commands
rheo	RHEO simulations of fluid flows and phase transitions
rigid	rigid bodies modeled as independent or coupled
shear	sideways shear applied to 2d solid, with and without a void
snap	NVE dynamics for BCC tantalum crystal using SNAP potential
srd	stochastic rotation dynamics (SRD) particles as solvent
steinhardt	Steinhardt-Nelson Q _l and W _l parameters using orientorder/atom
streitz	use of Streitz/Mintmire potential with charge equilibration
stress_vcm	removing binned rigid body motion from binned stress profile
tad	temperature-accelerated dynamics of vacancy diffusion in bulk Si
tersoff	regression test input for Tersoff potential variants
threebody	regression test input for a variety of manybody potentials
tracker	track interactions in LJ melt
triclinic	general triclinic simulation boxes versus orthogonal boxes
ttm	two-temperature model examples
vashishta	use of the Vashishta potential
voronoi	Voronoi tessellation via compute voronoi/atom command
wall	use of reflective walls with different stochastic models
yaml	demonstrates use of yaml thermo and dump styles

Here is how you can run and visualize one of the sample problems:

```
cd indent
cp ../../src/lmp_linux .           # copy LAMMPS executable to this dir
lmp_linux -in in.indent            # run the problem
```

Running the simulation produces the files *dump.indent* and *log.lammps*. You can visualize the dump file of snapshots with a variety of third-party tools highlighted on the [Visualization](#) page of the LAMMPS website.

If you uncomment the *dump image* line(s) in the input script a series of JPG images will be produced by the run (assuming you built LAMMPS with JPG support; see the [Build_settings](#) page for details). These can be viewed individually or turned into a movie or animated by tools like ImageMagick or QuickTime or various Windows-based tools. See the *dump image* page for more details. E.g. this Imagemagick command would create a GIF file suitable for viewing in a browser.

```
% convert -loop 1 *.jpg foo.gif
```

11.2 Uppercase directories

ASPHERE	various aspherical particle models, using ellipsoids, rigid bodies, line/triangle particles, etc
COUPLE	examples of how to use LAMMPS as a library
DIFFUSE	compute diffusion coefficients via several methods
ELASTIC	compute elastic constants at zero temperature
ELASTIC_T	compute elastic constants at finite temperature
HEAT	compute thermal conductivity for LJ and water via fix ehex
KAPPA	compute thermal conductivity via several methods
LEPTON	use of fix efield/lepton
MC-LOOP	using LAMMPS in a Monte Carlo mode to relax the energy of a system in a input script loop
PACKAGES	examples for specific packages and contributed commands
QUANTUM	how to use LAMMPS in tandem with several quantum codes via the MDI code coupling library
SPIN	examples for features of the SPIN package
UNITS	examples that run the same simulation in lj, real, metal units
VISCOSITY	compute viscosity via several methods

Nearly all of these directories have README files which give more details on how to understand and use their contents.

The PACKAGES directory has a large number of subdirectories which correspond by name to specific packages. They contain scripts that illustrate how to use the command(s) provided in those packages. Many of the subdirectories have their own README files which give further instructions. See the [Packages_details](#) doc page for more info on specific packages.

Part II

Programmer Guide

LAMMPS LIBRARY INTERFACES

As described on the [library interface to LAMMPS](#) page, LAMMPS can be built as a library (static or shared), so that it can be called by another code, used in a *coupled manner* with other codes, or driven through a *Python script*. The LAMMPS standalone executable itself is essentially a thin wrapper on top of the LAMMPS library, which creates a LAMMPS instance, passes the input for processing to that instance, and then exits.

Most of the APIs described below are based on C language wrapper functions in the files `src/library.h` and `src/library.cpp`, but it is also possible to use C++ directly. The basic procedure is always the same: you create one or more instances of [LAMMPS](#), pass commands as strings or from files to that LAMMPS instance to execute calculations, and/or call functions that read, manipulate, and update data from the active class instances inside LAMMPS to do analysis or perform operations that are not possible with existing input script commands.

Thread-safety

LAMMPS was initially not conceived as a thread-safe program, but over the years changes have been applied to replace operations that collide with creating multiple LAMMPS instances from multiple-threads of the same process with thread-safe alternatives. This primarily applies to the core LAMMPS code and less so on add-on packages, especially when those packages require additional code in the *lib* folder, interface LAMMPS to Fortran libraries, or the code uses static variables (like the COLVARS package).

Another major issue to deal with is to correctly handle MPI. Creating a LAMMPS instance requires passing an MPI communicator, or it assumes the `MPI_COMM_WORLD` communicator, which spans all MPI processor ranks. When creating multiple LAMMPS object instances from different threads, this communicator has to be different for each thread or else collisions can happen. Or it has to be guaranteed, that only one thread at a time is active. MPI communicators, however, are not a problem, if LAMMPS is compiled with the MPI STUBS library, which implies that there is no MPI communication and only 1 MPI rank.

1.1 LAMMPS C Library API

The C library interface is the most commonly used path to manage LAMMPS instances from a compiled code and it is the basis for the *Python* and *Fortran* modules. Almost all functions of the C language API require an argument containing a “handle” in the form of a `void *` type variable, which points to the location of a LAMMPS class instance.

The `library.h` header file by default does not include the `mpi.h` header file and thus hides the `lammops_open()` function which requires the declaration of the `MPI_comm` data type. This is only a problem when the communicator that would be passed is different from `MPI_COMM_WORLD`. Otherwise calling `lammops_open_no_mpi()` will work just as well. To make `lammops_open()` available, you need to compile the code with `-DLAMMPS_LIB_MPI` or add the line `#define LAMMPS_LIB_MPI` before `#include "library.h"`.

Please note the `mpi.h` file must usually be the same (and thus the MPI library in use) for the LAMMPS code and library and the calling code. The exception is when LAMMPS was compiled in serial mode using the STUBS MPI library. In

that case the calling code may be compiled with a different MPI library so long as `lammps_open_no_mpi()` is called to create a LAMMPS instance. In that case each MPI rank will run LAMMPS in serial mode.

Errors versus exceptions

If the LAMMPS executable encounters an error condition, it will abort after printing an error message. It does so by catching the exceptions that LAMMPS could throw. For a C library interface this is usually not desirable since the calling code might lack the ability to catch such exceptions. Thus, the library functions will catch those exceptions and return from the affected functions. The error status *can be queried* and an *error message retrieved*. This is, for example used by the *LAMMPS python module* and then a suitable Python exception is thrown.

Using the C library interface as a plugin

Rather than including the C library interface directly including the `library.h` header file and linking to the LAMMPS (static or shared) library at compile time, you can dynamically load LAMMPS at runtime, provided you compiled LAMMPS using a shared library or DLL. The `liblammpsplugin.h` header file and the `liblammpsplugin.c` C code in the `examples/COUPLE/plugin` folder for an interface to LAMMPS that is largely identical to the regular library interface, only that it will load a LAMMPS shared library file at runtime. This can be useful for applications where the interface to LAMMPS would be an optional feature or where you would like to load different versions of the LAMMPS library (e.g. an updated one) without replacing the executable. The *LAMMPS-GUI* is an example for such an application. It has a wrapper class that supports both modes and which is used can be changed at compile time.

Warning

No checks are made on the arguments of the function calls of the C library interface. *All* function arguments must be non-NULL unless *explicitly* allowed, and must point to consistent and valid data. Buffers for storing returned data must be allocated to a suitable size. Passing invalid or unsuitable information will likely cause crashes or corrupt data.

1.1.1 Creating or deleting a LAMMPS object

This section documents the following functions:

- `lammps_open()`
- `lammps_open_no_mpi()`
- `lammps_open_fortran()`
- `lammps_close()`
- `lammps_mpi_init()`
- `lammps_mpi_finalize()`
- `lammps_kokkos_finalize()`
- `lammps_python_finalize()`
- `lammps_plugin_finalize()`
- `lammps_error()`

The `lammps_open()` and `lammps_open_no_mpi()` functions are used to create and initialize a LAMMPS() instance. They return a reference to this instance as a `void *` pointer to be used as the “handle” argument in subsequent function calls until that instance is destroyed by calling `lammps_close()`. Here is a simple example demonstrating its use:

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int version;
    const char *lmpargv[] = { "liblammps", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    /* create LAMMPS instance */
    handle = lammps_open_no_mpi(lmpargc, (char **)lmpargv, NULL);
    if (handle == NULL) {
        printf("LAMMPS initialization failed");
        lammps_mpi_finalize();
        return 1;
    }

    /* get and print numerical version code */
    version = lammps_version(handle);
    printf("LAMMPS Version: %d\n",version);

    /* delete LAMMPS instance and shut down MPI */
    lammps_close(handle);
    lammps_mpi_finalize();
    return 0;
}
```

The LAMMPS library uses the MPI library it was compiled with and will either run on all processors in the `MPI_COMM_WORLD` communicator or on the set of processors in the communicator passed as the `comm` argument of `lammps_open()`. This means the calling code can run LAMMPS on all or a subset of processors. For example, a wrapper code might decide to alternate between LAMMPS and another code, allowing them both to run on all the processors. Or it might allocate part of the processors to LAMMPS and the rest to the other code by creating a custom communicator with `MPI_Comm_split()` and running both codes concurrently before syncing them up periodically. Or it might instantiate multiple instances of LAMMPS to perform different calculations and either alternate between them, run them concurrently on split communicators, or run them one after the other. The `lammps_open()` function may be called multiple times for this latter purpose.

The `lammps_close()` function is used to shut down the LAMMPS class pointed to by the handle passed as an argument and free all its memory. This has to be called for every instance created with one of the `lammps_open()` functions. It will, however, **not** call `MPI_Finalize()`, since that may only be called once. See `lammps_mpi_finalize()` for an alternative to invoking `MPI_Finalize()` explicitly from the calling program.

```
void *lammps_open(int argc, char **argv, MPI_Comm comm, void **ptr)
```

Create instance of the LAMMPS class and return pointer to it.

The `lammops_open()` function creates a new `LAMMPS` class instance while passing in a list of strings as if they were *command-line arguments* for the LAMMPS executable, and an MPI communicator for LAMMPS to run under. Since the list of arguments is **exactly** as when called from the command-line, the first argument would be the name of the executable and thus is otherwise ignored. However `argc` may be set to 0 and then `argv` may be NULL. If MPI is not yet initialized, `MPI_Init()` will be called during creation of the LAMMPS class instance.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument *ptr*.

Deprecated since version 18Sep2020: The *ptr* argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

See also

`lammops_open_no_mpi()`, `lammops_open_fortran()`

Note

This function is **only** declared when the code using the LAMMPS `library.h` include file is compiled with `-DLAMMPS_LIB_MPI`, or contains a `#define LAMMPS_LIB_MPI 1` statement before `#include "library.h"`. Otherwise you can only use the `lammops_open_no_mpi()` or `lammops_open_fortran()` functions.

Parameters

- **argc** – number of command-line arguments
- **argv** – list of command-line argument strings
- **comm** – MPI communicator for this `LAMMPS` instance
- **ptr** – pointer to a void pointer variable which serves as a handle; may be NULL

Returns

pointer to new `LAMMPS` instance cast to `void *`

`void *lammops_open_no_mpi(int argc, char **argv, void **ptr)`

Variant of `lammops_open()` that implicitly uses `MPI_COMM_WORLD`.

This function is a version of `lammops_open()`, that is missing the MPI communicator argument. It will use `MPI_COMM_WORLD` instead. The type and purpose of arguments and return value are otherwise the same.

Outside of the convenience, this function is useful, when the LAMMPS library was compiled in serial mode, but the calling code runs in parallel and the `MPI_Comm` data type of the STUBS library would not be compatible with that of the calling code.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument *ptr*.

Deprecated since version 18Sep2020: The *ptr* argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

See also

[*lammps_open\(\)*](#), [*lammps_open_fortran\(\)*](#)

Parameters

- **argc** – number of command-line arguments
- **argv** – list of command-line argument strings
- **ptr** – pointer to a void pointer variable which serves as a handle; may be NULL

Returns

pointer to new [*LAMMPS*](#) instance cast to void *

void ***lammps_open_fortran**(int argc, char **argv, int f_comm)

Variant of [*lammps_open\(\)*](#) using a Fortran MPI communicator.

Added in version 18Sep2020.

This function is a version of [*lammps_open\(\)*](#), that uses an integer for the MPI communicator as the MPI Fortran interface does. It is used in the [*lammps\(\)*](#) constructor of the LAMMPS Fortran module. Internally it converts the *f_comm* argument into a C-style MPI communicator with [*MPI_Comm_f2c\(\)*](#) and then calls [*lammps_open\(\)*](#).

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

See also

[*lammps_open_fortran\(\)*](#), [*lammps_open_no_mpi\(\)*](#)

Parameters

- **argc** – number of command-line arguments
- **argv** – list of command-line argument strings
- **f_comm** – Fortran style MPI communicator for this [*LAMMPS*](#) instance

Returns

pointer to new [*LAMMPS*](#) instance cast to void *

void **lammps_close**(void *handle)

Delete a [*LAMMPS*](#) instance created by [*lammps_open\(\)*](#) or its variants.

This function deletes the LAMMPS class instance pointed to by **handle** that was created by one of the [*lammps_open\(\)*](#) variants. It does **not** call [*MPI_Finalize\(\)*](#) to allow creating and deleting multiple LAMMPS instances concurrently or sequentially. See [*lammps_mpi_finalize\(\)*](#) for a function performing this operation.

Parameters

handle – pointer to a previously created [*LAMMPS*](#) instance

void **lammops_mpi_init()**

Ensure the MPI environment is initialized.

Added in version 18Sep2020.

The MPI standard requires that any MPI application must call `MPI_Init()` exactly once before performing any other MPI function calls. This function checks, whether MPI is already initialized and calls `MPI_Init()` in case it is not.

void **lammops_mpi_finalize()**

Shut down the MPI infrastructure.

Added in version 18Sep2020.

The MPI standard requires that any MPI application calls `MPI_Finalize()` before exiting. Even if a calling program does not do any MPI calls, MPI is still initialized internally to avoid errors accessing any MPI functions. This function should then be called right before exiting the program to wait until all (parallel) tasks are completed and then MPI is cleanly shut down. After calling this function no more MPI calls may be made.

See also

[`lammops\_kokkos\_finalize\(\)`](#), [`lammops\_python\_finalize\(\)`](#), [`lammops\_plugin\_finalize\(\)`](#)

void **lammops_kokkos_finalize()**

Shut down the Kokkos library environment.

Added in version 2Jul2021.

The Kokkos library may only be initialized once during the execution of a process. This is done automatically the first time Kokkos functionality is used. This requires that the Kokkos environment must be explicitly shut down after any LAMMPS instance using it is closed (to release associated resources). After calling this function no Kokkos functionality may be used.

See also

[`lammops\_mpi\_finalize\(\)`](#), [`lammops\_python\_finalize\(\)`](#), [`lammops\_plugin\_finalize\(\)`](#)

void **lammops_python_finalize()**

Clear the embedded Python environment

Added in version 20Sep2021.

This function resets and clears an embedded Python environment by calling the `Py_Finalize()` function of the embedded Python library, if enabled. This call would free up all allocated resources and release loaded shared objects.

However, this is **not** done when a LAMMPS instance is deleted because a) LAMMPS may have been used through the Python module and thus the Python interpreter is external and not embedded into LAMMPS and therefore may not be reset by LAMMPS b) some Python modules and extensions, most notably NumPy, are not compatible with being initialized multiple times, which would happen if additional LAMMPS instances using Python would be created *after* after calling `Py_Finalize()`.

This function can be called to explicitly clear the Python environment in case it is safe to do so.

See also

lammps_mpi_finalize(), *lammps_kokkos_finalize()*, *lammps_plugin_finalize()*

void **lammps_plugin_finalize()**

Unload all plugins and release the corresponding DSO handles

Added in version 12Jun2025.

This function clears the list of all loaded plugins and closes the corresponding DSO handles and releases the imported executable code.

However, this is **not** done when a LAMMPS instance is deleted because plugins and their shared objects are global properties.

This function can be called to explicitly clear out all loaded plugins in case it is safe to do so.

See also

lammps_mpi_finalize(), *lammps_kokkos_finalize()*, *lammps_python_finalize()*

void **lammps_error**(void *handle, int error_type, const char *error_text)

Call a *LAMMPS* Error class function

Added in version 3Nov2022.

This function is a wrapper around functions in the *Error* to print an error message and then stop LAMMPS.

The *error_type* parameter selects which function to call. It is a sum of constants from *_LMP_ERROR_CONST*. If the value does not match any valid combination of constants a warning is printed and the function returns.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **error_type** – parameter to select function in the *Error* class
- **error_text** – error message

1.1.2 Executing commands

This section documents the following functions:

- *lammps_file()*
 - *lammps_command()*
 - *lammps_commands_list()*
 - *lammps_commands_string()*
 - *lammps_expand()*
-

Once a LAMMPS instance is created, there are multiple ways to “drive” a simulation. In most cases it is easiest to process single or multiple LAMMPS commands like in an input file. This can be done through reading a file or passing single commands or lists of commands or blocks of commands with the following functions.

Via these functions, the calling code can have LAMMPS act on a series of *input file commands* that are either read from a file or passed as strings. For example, this allows setup of a problem from an input script, and then running it in stages while performing other operations in between or concurrently. The caller can interleave the LAMMPS function calls with operations it performs, such as calls to extract information from or set information within LAMMPS, or calls to another code's library.

Just as with *input script parsing* comments can be included in the file or strings, and expansion of variables with `$(name)` or `$(expression)` syntax is performed. Below is a short example using some of these functions.

```
/* define to make the otherwise hidden prototype for "lammps_open()" visible */
#define LAMMPS_LIB_MPI
#include "library.h"

#include <mpi.h>
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int i;

    MPI_Init(&argc, &argv);
    handle = lammps_open(0, NULL, MPI_COMM_WORLD, NULL);
    lammps_file(handle, "in.sysinit");
    lammps_command(handle, "run 1000 post no");

    for (i=0; i < 100; ++i) {
        lammps_commands_string(handle, "run 100 pre no post no\n"
                                   "print 'PE = $(pe)'\n"
                                   "print 'KE = $(ke)'\n");
    }
    lammps_close(handle);
    MPI_Finalize();
    return 0;
}
```

void **lammps_file**(void *handle, const char *file)

Process *LAMMPS* input from a file.

This function processes commands in the file pointed to by *filename* line by line and thus functions very similar to the *include* command. The function returns when the end of the file is reached and the commands have completed.

The actual work is done by the functions *Input::file(const char *)* and *Input::file()*.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **filename** – name of a file with *LAMMPS* input

```
char *lammips_command(void *handle, const char *cmd)
```

Process a single *LAMMPS* input command from a string.

This function tells LAMMPS to execute the single command in the string *cmd*. The entire string is considered as command and need not have a (final) newline character. Newline characters in the body of the string, however, will be treated as part of the command and will **not** start a second command. The function *lammips_commands_string()* processes a string with multiple command-lines.

The function returns the name of the command on success or NULL when passing a string without a command.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **cmd** – string with a single *LAMMPS* command

Returns

string with parsed command name or NULL

```
void lammips_commands_list(void *handle, int ncmd, const char **cmds)
```

Process multiple *LAMMPS* input commands from list of strings.

This function processes multiple commands from a list of strings by first concatenating the individual strings in *cmds* into a single string, inserting newline characters as needed. The combined string is passed to *lammips_commands_string()* for processing.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
 - **ncmd** – number of lines in *cmds*
 - **cmds** – list of strings with *LAMMPS* commands
-

```
void lammips_commands_string(void *handle, const char *str)
```

Process a block of *LAMMPS* input commands from a single string.

This function processes a multi-line string similar to a block of commands from a file. The string may have multiple lines (separated by newline characters) and also single commands may be distributed over multiple lines with continuation characters ('&'). Those lines are combined by removing the '&' and the following newline character. After this processing the string is handed to LAMMPS for parsing and executing.

Added in version 21Nov2023: The command is now able to process long strings with triple quotes and loops using *jump SELF <label>*.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
 - **str** – string with block of *LAMMPS* input commands
-

char ***lammps_expand**(void *handle, const char *line)
expand a single *LAMMPS* input line from a string.

This function tells LAMMPS to expand the string in *cmd* like it would process an input line fed to *lammps_command()* **without** executing it. The *entire* string is considered as input and need not have a (final) newline character. Newline characters in the body of the string, however, will be treated as part of the command and will **not** start a second command.

The function returns the expanded string in a new string buffer that must be freed with *lammps_free()* after use to avoid a memory leak.

See also

lammps_eval()

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **line** – string with a single *LAMMPS* input line

Returns

string with expanded line

1.1.3 System properties

This section documents the following functions:

- *lammps_get_natoms()*
- *lammps_get_thermo()*
- *lammps_last_thermo()*
- *lammps_extract_box()*
- *lammps_reset_box()*
- *lammps_memory_usage()*
- *lammps_get_mpi_comm()*
- *lammps_extract_setting()*
- *lammps_extract_global_datatype()*
- *lammps_extract_global()*
- *lammps_extract_pair_dimension()*
- *lammps_extract_pair()*
- *lammps_map_atom()*

The library interface allows the extraction of different kinds of information about the active simulation instance and also - in some cases - to apply modifications to it. This enables combining of a LAMMPS simulation with other processing and simulation methods computed by the calling code, or by another code that is coupled to LAMMPS via the library interface. In some cases the data returned is direct reference to the original data inside LAMMPS, cast to a void pointer. In that case the data needs to be cast to a suitable pointer for the calling program to access it, and you may need to know the correct dimensions and lengths. This also means you can directly change those value(s) from the calling program (e.g., to modify atom positions). Of course, changing values should be done with care. When accessing per-atom data,

please note that these data are the per-processor **local** data and are indexed accordingly. Per-atom data can change sizes and ordering at every neighbor list rebuild or atom sort event as atoms migrate between subdomains and processors.

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int i;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.sysinit");
    printf("Running a simulation with %g atoms.\n",
        lammps_get_natoms(handle));

    printf(" %d local and %d ghost atoms. %d atom types\n",
        lammps_extract_setting(handle, "nlocal"),
        lammps_extract_setting(handle, "nghost"),
        lammps_extract_setting(handle, "ntypes"));

    double *dt = (double *)lammps_extract_global(handle, "dt");
    printf("Changing timestep from %g to 0.5\n", *dt);
    *dt = 0.5;

    lammps_command(handle, "run 1000 post no");

    for (i=0; i < 10; ++i) {
        lammps_command(handle, "run 100 pre no post no");
        printf("PE = %g\nKE = %g\n",
            lammps_get_thermo(handle, "pe"),
            lammps_get_thermo(handle, "ke"));
    }
    lammps_close(handle);
    return 0;
}
```

double **lammps_get_natoms**(void *handle)

Return the total number of atoms in the system.

This number may be very large when running large simulations across multiple processes. Depending on compile time choices, LAMMPS may be using either 32-bit or a 64-bit integer to store this number. For portability this function returns thus a double precision floating point number, which can represent up to a 53-bit signed integer exactly ($\approx 10^{16}$).

As an alternative, you can use `lammps_extract_global()` and cast the resulting pointer to an integer pointer of the correct size and dereference it. The size of that integer (in bytes) can be queried by calling `lammps_extract_setting()` to return the size of a bigint integer.

Changed in version 18Sep2020: The type of the return value was changed from `int` to `double` to accommodate reporting atom counts for larger systems that would overflow a 32-bit `int` without having to depend on a 64-bit integer type definition.

Parameters

handle – pointer to a previously created *LAMMPS* instance

Returns

total number of atoms or 0 if value is too large

double **lammops_get_thermo**(void *handle, const char *keyword)

Evaluate a thermo keyword.

This function returns the current value of a *thermo keyword*. Unlike *lammops_extract_global()* it does not give access to the storage of the desired data but returns its value as a double, so it can also return information that is computed on-the-fly. Use *lammops_last_thermo()* to get access to the cached data from the last thermo output.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **keyword** – string with the name of the thermo keyword

Returns

value of the requested thermo property or 0.0

void ***lammops_last_thermo**(void *handle, const char *what, int index)

Access cached data from last thermo output

Added in version 15Jun2023.

This function provides access to cached data from the last thermo output. This differs from *lammops_get_thermo()* in that it does **not** trigger an evaluation. Instead it provides direct access to a read-only location of the last thermo output data and the corresponding keyword strings. How to handle the return value depends on the value of the *what* argument string. When accessing the data from a concurrent thread while LAMMPS is running, the cache needs to be locked first and then unlocked after the data is obtained, so that the data is not corrupted while reading in case LAMMPS wants to update it at the same time. Outside of a run, the lock/unlock calls have no effect.

Value of <i>what</i>	Description of return value	Data type	Uses index
setup	1 if setup is not completed and thus thermo data invalid, 0 otherwise	pointer to int	no
line	line number (0-based) of current line in current file or buffer	pointer to int	no
imagename	file name of the last <i>dump image</i> file written	pointer to 0-terminated const char array	no
step	timestep when the last thermo output was generated or -1	pointer to bigint	no
num	number of fields in thermo output	pointer to int	no
keyword	column keyword for thermo output	pointer to 0-terminated const char array	yes
type	data type of thermo output column; see <code>_LMP_DATATYPE_CONST</code>	pointer to int	yes
data	actual field data for column	pointer to int, int64_t or double	yes
lock	acquires lock to thermo data cache	NULL pointer	no
unlock	releases lock to thermo data cache	NULL pointer	no

Note

The *type* property points to a static location that is reassigned with every call, so the returned pointer should be recast, dereferenced, and assigned immediately. Otherwise, its value may be changed with the next invocation of the function.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **what** – string with the kind of data requested
- **index** – integer with index into data arrays, ignored for scalar data

Returns

pointer to location of requested data cast to void or NULL

```
void lammers_extract_box(void *handle, double *boxlo, double *boxhi, double *xy, double *yz, double *xz, int *pflags, int *boxflag)
```

Extract simulation box parameters.

This function (re-)initializes the simulation box and boundary information and then assign the designated data to the locations in the pointers passed as arguments. Any argument (except the first) may be a NULL pointer and then will not be assigned.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **boxlo** – pointer to 3 doubles where the lower box boundary is stored
- **boxhi** – pointer to 3 doubles where the upper box boundary is stored
- **xy** – pointer to a double where the xy tilt factor is stored

- **yz** – pointer to a double where the yz tilt factor is stored
 - **xz** – pointer to a double where the xz tilt factor is stored
 - **pflags** – pointer to 3 ints, set to 1 for periodic boundaries and 0 for non-periodic
 - **boxflag** – pointer to an int, which is set to 1 if the box will be changed during a simulation by a fix and 0 if not.
-

void **lammops_reset_box**(void *handle, double *boxlo, double *boxhi, double xy, double yz, double xz)

Reset simulation box parameters.

This function sets the simulation box dimensions (upper and lower bounds and tilt factors) from the provided data and then re-initializes the box information and all derived settings. It may only be called before atoms are created.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
 - **boxlo** – pointer to 3 doubles containing the lower box boundary
 - **boxhi** – pointer to 3 doubles containing the upper box boundary
 - **xy** – xy tilt factor
 - **yz** – yz tilt factor
 - **xz** – xz tilt factor
-

void **lammops_memory_usage**(void *handle, double *meminfo)

Get memory usage information

Added in version 18Sep2020.

This function will retrieve memory usage information for the current LAMMPS instance or process. The *meminfo* buffer will be filled with 3 different numbers (if supported by the operating system). The first is the tally (in MBytes) of all large memory allocations made by LAMMPS. This is a lower boundary of how much memory is requested and does not account for memory allocated on the stack or allocations via *new*. The second number is the current memory allocation of the current process as returned by a memory allocation reporting in the system library. The third number is the maximum amount of RAM (not swap) used by the process so far. If any of the two latter parameters is not supported by the operating system it will be set to zero.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
 - **meminfo** – buffer with space for at least 3 double to store data in.
-

int **lammops_get_mpi_comm**(void *handle)

Return current *LAMMPS* world communicator as integer

Added in version 18Sep2020.

This will take the LAMMPS “world” communicator and convert it to an integer using `MPI_Comm_c2f()`, so it is equivalent to the corresponding MPI communicator in Fortran. This way it can be safely passed around between different programming languages. To convert it to the C language representation use `MPI_Comm_f2c()`.

If LAMMPS was compiled with `MPI_STUBS`, this function returns -1.

See also

[`lammps\_open\_fortran\(\)`](#)

Parameters

handle – pointer to a previously created [*LAMMPS*](#) instance

Returns

Fortran representation of the [*LAMMPS*](#) world communicator

```
int lammps_extract_setting(void *handle, const char *keyword)
```

Query [*LAMMPS*](#) about global settings.

This function will retrieve or compute global properties. In contrast to [`lammps\_get\_thermo\(\)`](#) this function returns an `int`. The following tables list the currently supported keyword. If a keyword is not recognized, the function returns -1. The integer sizes functions may be called without a valid LAMMPS object handle (it is ignored).

- [*Integer sizes*](#)
- [*Image masks*](#)
- [*System status*](#)
- [*System sizes*](#)
- [*Neighbor list settings*](#)
- [*Atom style flags*](#)
- [*Thermo settings*](#)

Integer sizes

Keyword	Description / Return value
bigint	size of the bigint integer type, 4 or 8 bytes. Set at <i>compile time</i> .
tagint	size of the tagint integer type, 4 or 8 bytes. Set at <i>compile time</i> .
imageint	size of the imageint integer type, 4 or 8 bytes. Set at <i>compile time</i> .
MAX_GROUP	size of the bitmask for groups in bits, should be 32. Currently hard coded.

Image masks

These settings are related to how LAMMPS stores and interprets periodic images. The values are used internally by the [*Fortran interface*](#) and are not likely to be useful to users.

Keyword	Description / Return value
IMGMASK	Bit-mask used to convert image flags to a single integer
IMGMAX	Maximum allowed image number for a particular atom
IMGBITS	Bits used in image counts
IMG2BITS	Second bitmask used in image counts

System status

Keyword	Description / Return value
dimension	Number of dimensions: 2 or 3. See <i>dimension command</i> .
box_exist	1 if the simulation box is defined, 0 if not. See <i>create_box command</i> .
kokkos_active	1 if the KOKKOS package is compiled in and activated, 0 if not. See <i>KOKKOS package</i> .
kokkos_nthreads	Number of Kokkos threads per MPI process, 0 if Kokkos is not active. See <i>KOKKOS package</i> .
kokkos_ngpus	Number of Kokkos gpus per physical node, 0 if Kokkos is not active or no GPU support. See <i>KOKKOS package</i> .
nthreads	Number of requested OpenMP threads per MPI process for LAMMPS' execution
newton_bond	1 if Newton's 3rd law is applied to bonded interactions, 0 if not.
newton_pair	1 if Newton's 3rd law is applied to non-bonded interactions, 0 if not.
triclinic	1 if the the simulation box is triclinic, 0 if orthogonal. See <i>change_box command</i> .

Communication status

Keyword	Description / Return value
uni-verse_rank	MPI rank on LAMMPS' universe communicator (0 <= universe_rank < universe_size)
universe_size	Number of ranks on LAMMPS' universe communicator (world_size <= universe_size)
world_rank	MPI rank on LAMMPS' world communicator (0 <= world_rank < world_size, = comm->me)
world_size	Number of ranks on LAMMPS' world communicator (aka comm->nprocs)
comm_style	communication style (0 = BRICK, 1 = TILED)
comm_layout	communication layout (0 = LAYOUT_UNIFORM, 1 = LAYOUT_NONUNIFORM, 2 = LAYOUT_TILED)
comm_mode	communication mode (0 = SINGLE, 1 = MULTI)
ghost_velocity	whether velocities are communicated for ghost atoms (0 = no, 1 = yes)

System sizes

Keyword	Description / Return value
nlocal	number of “owned” atoms of the current MPI rank.
nghost	number of “ghost” atoms of the current MPI rank.
nall	number of all “owned” and “ghost” atoms of the current MPI rank.
nmax	maximum of nlocal+nghost across all MPI ranks (for per-atom data array size).
ntypes	number of atom types
nbondtypes	number of bond types
nangletypes	number of angle types
ndihedraltypes	number of dihedral types
nimproptypes	number of improper types
bond_per_atom	size of per-atom bond data arrays
angle_per_atom	size of per-atom angle data arrays
dihedral_per_atom	size of per-atom dihedral data arrays
improper_per_atom	size of per-atom improper data arrays
maxspecial	size of per-atom special data array
nellipsoids	number of atoms that have ellipsoid data
nlines	number of atoms that have line data (see <i>pair style line/lj</i>)
ntris	number of atoms that have triangle data (see <i>pair style tri/lj</i>)
nbodies	number of atoms that have body data (see <i>the Body particle HowTo</i>)

Neighbor list settings

neigh_every	neighbor lists are rebuild every this many steps
neigh_delay	neighbor lists are rebuild delayed this many steps
neigh_dist_check	0 if always rebuild, 1 rebuild after 1/2 skin
neigh_ago	neighbor lists were rebuilt this many steps ago
nbondlist	number of entries in bondlist (get list with <i>lammmps_extract_global()</i>)
nanglelist	number of entries in anglelist (get list with <i>lammmps_extract_global()</i>)
ndihedrallist	number of entries in dihedrallist (get list with <i>lammmps_extract_global()</i>)
nimproperlist	number of entries in improperlist (get list with <i>lammmps_extract_global()</i>)

Atom style flags

Keyword	Description / Return value
molecule_flag	1 if the atom style includes molecular topology data. See atom_style command .
q_flag	1 if the atom style includes point charges. See atom_style command .
mu_flag	1 if the atom style includes point dipoles. See atom_style command .
rmass_flag	1 if the atom style includes per-atom masses, 0 if there are per-type masses. See atom_style command .
radius_flag	1 if the atom style includes a per-atom radius. See atom_style command .
body_flag	1 if the atom style describes body particles. See atom_style command .
ellipsoid_flag	1 if the atom style describes extended particles that may be ellipsoidal. See atom_style command .
line_flag	1 if the atom style describes line particles. See atom_style command .
tri_flag	1 if the atom style describes tri particles. See atom_style command .
omega_flag	1 if the atom style can store per-atom rotational velocities. See atom_style command .
torque_flag	1 if the atom style can store per-atom torques. See atom_style command .
angmom_flag	1 if the atom style can store per-atom angular momentum. See atom_style command .

Thermo settings

Keyword	Description / Return value
thermo_every	The current interval of thermo output. See thermo command .
thermo_norm	1 if the thermo output is normalized. See thermo_modify command .

See also

[lammops_extract_global\(\)](#)

Parameters

- **handle** – pointer to a previously created [LAMMPS](#) instance
- **keyword** – string with the name of the thermo keyword

Returns

value of the queried setting or -1 if unknown

int **lammops_extract_global_datatype**(void *handle, const char *name)

Get data type of internal global [LAMMPS](#) variables or arrays.

Added in version 18Sep2020.

This function returns an integer that encodes the data type of the global property with the specified name. See `_LMP_DATATYPE_CONST` for valid values. Callers of [lammops_extract_global\(\)](#) can use this information to then decide how to cast the void * pointer and access the data.

Parameters

- **handle** – pointer to a previously created [LAMMPS](#) instance (unused)
- **name** – string with the name of the extracted property

Returns

integer constant encoding the data type of the property or -1 if not found.

```
void *lammmps_extract_global(void *handle, const char *name)
```

Get pointer to internal global *LAMMPS* variables or arrays.

This function returns a pointer to the location of some global property stored in one of the constituent classes of a LAMMPS instance. The returned pointer is cast to `void *` and needs to be cast to a pointer of the type that the entity represents. The pointers returned by this function are generally persistent; therefore it is not necessary to call the function again, unless a *clear command* is issued which wipes out and recreates the contents of the *LAMMPS* class.

Please also see *lammmps_extract_setting()*, *lammmps_get_thermo()*, and *lammmps_extract_box()*.

The following tables list the supported names, their data types, length of the data area, and a short description. The data type can also be queried through calling *lammmps_extract_global_datatype()*. The `bigint` type may be defined to be either an `int` or an `int64_t`. This is set at *compile time* of the LAMMPS library and can be queried through calling *lammmps_extract_setting()*. The function *lammmps_extract_global_datatype()* will directly report the “native” data type. The following tables are provided:

- *Timestep settings*
- *Simulation box settings*
- *System property settings*
- *Neighbor topology data*
- *Energy and virial tally settings*
- *Git revision and version settings*
- *Unit settings*

Timestep settings

Name	Type	Length	Description
dt	double	1	length of the time step. See <i>timestep command</i> .
ntimestep	bigint	1	current time step number. See <i>reset_timestep command</i> .
atime	double	1	accumulated simulation time in time units.
atimestep	bigint	1	the number of the timestep when “atime” was last updated.
respa_levels	int	1	N_{respa} = number of r-RESPA levels. See <i>run_style command</i> .
respa_dt	double	N_{respa}	length of the time steps with r-RESPA. See <i>run_style command</i> .

Simulation box settings

Name	Type	Length	Description
boxlo	double	3	lower box boundaries in x-, y-, and z-direction; see create_box command .
boxhi	double	3	lower box boundaries in x-, y-, and z-direction; see create_box command .
boxxlo	double	1	lower box boundary in x-direction; see create_box command .
boxxhi	double	1	upper box boundary in x-direction; see create_box command .
boxylo	double	1	lower box boundary in y-direction; see create_box command .
boxyhi	double	1	upper box boundary in y-direction; see create_box command .
boxzlo	double	1	lower box boundary in z-direction; see create_box command .
boxzhi	double	1	upper box boundary in z-direction; see create_box command .
sublo	double	3	subbox lower boundaries in x-, y-, and z-direction
subhi	double	3	subbox upper boundaries in x-, y-, and z-direction
sublo_lambda	double	3	subbox lower boundaries in fractional coordinates (for triclinic cells only)
subhi_lambda	double	3	subbox upper boundaries in fractional coordinates (for triclinic cells only)
periodicity	int	3	0 if non-periodic, 1 if periodic for x, y, and z; see boundary command .
triclinic	int	1	1 if box is triclinic, 0 if orthogonal; see change_box command .
xy	double	1	triclinic tilt factor; see Triclinic (non-orthogonal) simulation boxes .
yz	double	1	triclinic tilt factor; see Triclinic (non-orthogonal) simulation boxes .
xz	double	1	triclinic tilt factor; see Triclinic (non-orthogonal) simulation boxes .
xlattice	double	1	lattice spacing in x-direction; see lattice command .
ylattice	double	1	lattice spacing in y-direction; see lattice command .
zlattice	double	1	lattice spacing in z-direction; see lattice command .
procgrid	int	3	processor count in x-, y-, and z- direction; see processors command .

System property settings

Name	Type	Length	Description
natoms	bigint	1	total number of atoms in the simulation.
nbonds	bigint	1	total number of bonds in the simulation.
nangles	bigint	1	total number of angles in the simulation.
ndihedrals	bigint	1	total number of dihedrals in the simulation.
nimprovers	bigint	1	total number of improvers in the simulation.
nlocal	int	1	number of “owned” atoms of the current MPI rank.
nghost	int	1	number of “ghost” atoms of the current MPI rank.
nmax	int	1	maximum of nlocal+nghost across all MPI ranks (for per-atom data array size).
ntypes	int	1	number of atom types
special_lj	double	4	special <i>pair weighting factors</i> for LJ interactions (first element is always 1.0)
special_coul	double	4	special <i>pair weighting factors</i> for Coulomb interactions (first element is always 1.0)
map_style	int	1	<i>atom map setting</i> : 0 = none, 1 = array, 2 = hash, 3 = yes
map_tag_max	int/bigint	1	largest atom ID that can be mapped to a local index (bigint with -DLAMMPS_BIGBIG)
sametag	int	variable	index of next local atom with the same ID in ascending order. -1 signals end.
sortfreq	int	1	frequency of atom sorting. 0 means sorting is off.
nextsort	bigint	1	timestep when atoms are sorted next
q_flag	int	1	deprecated. Use <i>lammps_extract_setting()</i> instead.
atom_style	char *	1	string with the current atom style.
pair_style	char *	1	string with the current pair style.
bond_style	char *	1	string with the current bond style.
angle_style	char *	1	string with the current angle style.
dihedral_style	char *	1	string with the current dihedral style.
improper_style	char *	1	string with the current improper style.
kpspace_style	char *	1	string with the current KSpace style.

Neighbor topology data

Get length of lists with *lammps_extract_setting()*.

Name	Type	Length	Description
neigh_skin	double	1	neighbor list skin
neigh_cutmin	double	1	minimum neighbor cutoff across all type pairs
neigh_cutmax	double	1	maximum neighbor cutoff across all type pairs
neigh_bondlist	2d int	nbondlist	list of bonds (atom1, atom2, type)
neigh_anglelist	2d int	nanglelist	list of angles (atom1, atom2, atom3, type)
neigh_dihedrallist	2d int	ndihedrallist	list of dihedrals (atom1, atom2, atom3, atom4, type)
neigh_improperlist	2d int	nimproperlist	list of improvers (atom1, atom2, atom3, atom4, type)

Energy and virial tally settings

Name	Type	Length	Description
eflag_global	bigint	1	timestep global energy is tallied on
eflag_atom	bigint	1	timestep per-atom energy is tallied on
vflag_global	bigint	1	timestep global virial is tallied on
vflag_atom	bigint	1	timestep per-atom virial is tallied on

Git revision and version settings

Name	Type	Length	Description
git_commit	const char *	1	Git commit hash for the LAMMPS version.
git_branch	const char *	1	Git branch for the LAMMPS version.
git_descriptor	const char *	1	Combined descriptor for the git revision
lammps_version	const char *	1	LAMMPS version string.

Unit settings

Name	Type	Length	Description
units	char *	1	string with the current unit style. See units command .
boltz	double	1	value of the “boltz” constant. See units command .
hplanck	double	1	value of the “hplanck” constant. See units command .
mvv2e	double	1	factor to convert $\frac{1}{2}mv^2$ for a particle to the current energy unit; See units command .
ftm2v	double	1	(description missing) See units command .
mv2d	double	1	(description missing) See units command .
nktv2p	double	1	(description missing) See units command .
qqr2e	double	1	factor to convert $\frac{q_i q_j}{r}$ to energy units; See units command .
qe2f	double	1	(description missing) See units command .
vxmu2f	double	1	(description missing) See units command .
txt2kmu	double	1	(description missing) See units command .
dielectric	double	1	value of the dielectric constant. See dielectric command .
qqr2e	double	1	(description missing) See units command .
e_mass	double	1	(description missing) See units command .
hhmrr2e	double	1	(description missing) See units command .
mvh2r	double	1	(description missing) See units command .
angstrom	double	1	constant to convert current length unit to angstroms; 1.0 for reduced (aka “lj”) units. See units command .
femtosecond	double	1	constant to convert current time unit to femtoseconds; 1.0 for reduced (aka “lj”) units
qelectron	double	1	(description missing) See units command .

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures or crashes or bogus simulations. In general it is thus usually better to use a LAMMPS input command that sets or changes these parameters. Those will take care of all side effects and necessary updates of settings derived from such settings. Where possible, a reference to such a command or a relevant section of the manual is given below.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – string with the name of the extracted property

Returns

pointer (cast to `void *`) to the location of the requested property. NULL if name is not known.

int **lammops_extract_pair_dimension**(void *handle, const char *name)

Get data dimension of pair style data accessible via `Pair::extract()`.

Added in version 29Aug2024.

This function returns an integer that specified the dimensionality of the data that can be extracted from the current pair style with `Pair::extract()`. Callers of *lammops_extract_pair()* can use this information to then decide how to cast the `void *` pointer and access the data.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – string with the name of the extracted property

Returns

integer constant encoding the dimensionality of the extractable pair style property or -1 if not found.

void ***lammops_extract_pair**(void *handle, const char *name)

Get extract pair style data accessible via `Pair::extract()`.

Added in version 29Aug2024.

This function returns a pointer to data available from the current pair style with `Pair::extract()`. The dimensionality of the returned pointer can be determined with *lammops_extract_pair_dimension()*.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – string with the name of the extracted property

Returns

pointer (cast to `void *`) to the location of the requested property. NULL if name is not known.

int **lammops_map_atom**(void *handle, const void *id)

Map global atom ID to local atom index

Added in version 27June2024.

This function returns an integer that corresponds to the local atom index for an atom with the global atom ID *id*. The atom ID is passed as a void pointer so that it can use the same interface for either a 32-bit or 64-bit tagint. The size of the tagint can be determined using [lammmps_extract_setting\(\)](#).

Parameters

- **handle** – pointer to a previously created [LAMMPS](#) instance
- **id** – void pointer to the atom ID (of data type tagint, i.e. 32-bit or 64-bit integer)

Returns

local atom index or -1 if the atom is not found or no map exists

1.1.4 Per-atom properties

This section documents the following functions:

- [lammmps_extract_atom_datatype\(\)](#)
 - [lammmps_extract_atom_size\(\)](#)

int **lammmps_extract_atom_datatype**(void *handle, const char *name)

Get data type of a [LAMMPS](#) per-atom property

Added in version 18Sep2020.

This function returns an integer that encodes the data type of the per-atom property with the specified name. See `_LMP_DATATYPE_CONST` for valid values. Callers of [lammmps_extract_atom\(\)](#) can use this information to decide how to cast the void * pointer and access the data. In addition, [lammmps_extract_atom_size\(\)](#) can be used to get information about the vector or array dimensions.

Parameters

- **handle** – pointer to a previously created [LAMMPS](#) instance
- **name** – string with the name of the extracted property

Returns

integer constant encoding the data type of the property or -1 if not found.

int **lammmps_extract_atom_size**(void *handle, const char *name, int type)

Get dimension info of a [LAMMPS](#) per-atom property

Added in version 19Nov2024.

This function returns an integer with the size of the per-atom property with the specified name. This allows to accurately determine the size of the per-atom data vectors or arrays. For per-atom arrays, the *type* argument is required to return either the number of rows or the number of columns. It is ignored for per-atom vectors.

Callers of [lammmps_extract_atom\(\)](#) can use this information in combination with the result from [lammmps_extract_atom_datatype\(\)](#) to decide how to cast the void * pointer and access the data.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – string with the name of the extracted property
- **type** – either LMP_SIZE_ROWS or LMP_SIZE_COLS if *name* refers to a per-atom array otherwise ignored

Returns

integer with the size of the vector or array dimension or -1

```
void *lammers_extract_atom(void *handle, const char *name)
```

Get pointer to a *LAMMPS* per-atom property.

This function returns a pointer to the location of per-atom properties (and per-atom-type properties in the case of the ‘mass’ keyword). Per-atom data is distributed across sub-domains and thus MPI ranks. The returned pointer is cast to `void *` and needs to be cast to a pointer of data type that the entity represents. You can use the functions *lammers_extract_atom_datatype()* and *lammers_extract_atom_size()* to determine data type, dimensions and sizes of the storage pointed to by the returned pointer.

A table with supported keywords is included in the documentation of the *Atom::extract()* function.

Changed in version 4Jul2026.

When using the KOKKOS package with a device backend, per-atom data is now synchronized from the device to the host before the pointer is returned. Previously the host copy could be out-of-date for calls not aligned with an output or end-of-run step.

Note

When running with the KOKKOS package and per-atom data residing on an accelerator device (e.g. a GPU), the requested data is synchronized from the device to the host before the pointer is returned, so that the host data accessed through it is current even when this function is called between output steps (for example from the LAMMPS GUI or a Python script while a run is in progress).

Warning

The pointers returned by this function are generally not persistent since per-atom data may be re-distributed, re-allocated, and re-ordered at every re-neighboring operation.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – string with the name of the extracted property

Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

1.1.5 Computes, fixes, variables

This section documents accessing or modifying data stored by computes, fixes, or variables in LAMMPS using the following functions:

- `lammps_extract_compute()`
 - `lammps_extract_fix()`
 - `lammps_extract_variable_datatype()`
 - `lammps_extract_variable()`
 - `lammps_set_variable()`
 - `lammps_set_string_variable()`
 - `lammps_set_internal_variable()`
 - `lammps_variable_info()`
 - `lammps_eval()`
 - `lammps_clearstep_compute()`
 - `lammps_addstep_compute_all()`
 - `lammps_addstep_compute()`
-

void ***lammps_extract_compute**(void *handle, const char *id, int style, int type)

Get pointer to data from a *LAMMPS* compute.

This function returns a pointer to the location of data provided by a *compute command* instance identified by the compute-ID. Computes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array or they may provide the information about the dimensions of the respective data. Since computes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function returns NULL if the compute ID is not found or the requested data is not available or current. The following table lists the available options.

Style (see <code>_LMP_STYLE_CONST</code>)	Type (see <code>_LMP_TYPE_CONST</code>)	Returned type	Returned data
LMP_STYLE_GLOBAL	LMP_TYPE_SCALAR	double *	Global scalar
LMP_STYLE_GLOBAL	LMP_TYPE_VECTOR	double *	Global vector
LMP_STYLE_GLOBAL	LMP_TYPE_ARRAY	double **	Global array
LMP_STYLE_GLOBAL	LMP_SIZE_VECTOR	int *	Length of global vector
LMP_STYLE_GLOBAL	LMP_SIZE_ROWS	int *	Rows of global array
LMP_STYLE_GLOBAL	LMP_SIZE_COLS	int *	Columns of global array
LMP_STYLE_ATOM	LMP_TYPE_VECTOR	double *	Per-atom value
LMP_STYLE_ATOM	LMP_TYPE_ARRAY	double **	Per-atom vector
LMP_STYLE_ATOM	LMP_SIZE_COLS	int *	Columns in per-atom array, 0 if vector
LMP_STYLE_LOCAL	LMP_TYPE_VECTOR	double *	Local data vector
LMP_STYLE_LOCAL	LMP_TYPE_ARRAY	double **	Local data array
LMP_STYLE_LOCAL	LMP_SIZE_VECTOR	int *	Alias for LMP_SIZE_ROWS
LMP_STYLE_LOCAL	LMP_SIZE_ROWS	int *	Number of local array rows or length of vector
LMP_STYLE_LOCAL	LMP_SIZE_COLS	int *	Number of local array columns, 0 if vector

Note

If the compute's data is not computed for the current step, the compute will be invoked. LAMMPS cannot easily check at that time, if it is valid to invoke a compute, so it may fail with an error. The caller has to check to avoid such an error.

Warning

The pointers returned by this function are generally not persistent since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation. It is advisable to re-invoke this function before the data is accessed, or make a copy if the data shall be used after other LAMMPS commands have been issued.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **id** – string with ID of the compute
- **style** – constant indicating the style of data requested (global, per-atom, or local)
- **type** – constant indicating type of data (scalar, vector, or array) or size of rows or columns

Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

```
void *lammmps_extract_fix(void *handle, const char *id, int style, int type, int nrow, int ncol)
```

Get pointer to data from a *LAMMPS* fix.

This function returns a pointer to data provided by a *fix command* instance identified by its fix-ID. Fixes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array, or they may provide the information about the dimensions of the respective data. Since individual fixes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function set the error status and returns NULL if the fix ID is not found or the requested data is not available.

Accessing global data

When requesting **global** data, the fix data can internally only be accessed one item at a time without access to the underlying pointer itself (it may also be computed on-the-fly). Thus this function allocates temporary storage for the requested data, copy the data to it, and return a pointer to the location of the copy. Therefore the allocated storage needs to be freed with *lammmps_free()* after its use to avoid a memory leak. Example:

```
double *dptr = (double *) lammmps_extract_fix(handle, name, LMP_STYLE_GLOBAL, LMP_
→TYPE_VECTOR, 0, 0);
double value = *dptr;
lammmps_free((void *)dptr);
```

i Requesting rows, columns, or the entire global array

In order to avoid the inefficient allocation and deallocation of temporary storage for single values, this functions accepts special values of -1 for the nrow and ncol arguments. For the negative values, the entire row, or column, or full array is copied to a (flat) block of storage and its pointer returned. This still is a copy and needs to be deallocated with `lammps_free()` as indicated in the note above. In case of requesting the whole array, the data is returned column by column, i.e. as `d(c_0,r_0)`, `d(c_0,r_1)`, ... `d(c_0, c_nrow-1)`, `d(c_1,r_0)`, `d(c_1,r_1)`, ... `d(c_ncol-1, r_nrow-1)` for a total of `nrow * ncol` elements. Example use:

```
int nrows = *(int *) lammps_extract_fix(handle, name, LMP_STYLE_GLOBAL, LMP_SIZE_
→ROWS, 0,0);
int ncols = *(int *) lammps_extract_fix(handle, name, LMP_STYLE_GLOBAL, LMP_SIZE_
→COLS, 0,0);
double *dptr = (double *) lammps_extract_fix(handle, name, LMP_STYLE_GLOBAL, LMP_
→TYPE_ARRAY, -1, -1);
printf("values[%d][%d] = {\n", ncols, nrows);
for (int j = 0; j < ncols; ++j) {
    printf(" { ");
    for (int i = 0; i < nrows; ++i) printf("%g, ", dvalue[j * nrows + i]);
    printf("},\n");
}
printf("};\n");
lammps_free((void *)dptr);
```

The following table lists the available options.

Style (see <code>_LMP_STYLE_CONST</code>)	Type (see <code>_LMP_TYPE_CONST</code>)	Returned type	Returned data
LMP_STYLE_GLOBAL	LMP_TYPE_SCALAR	double *	Copy of global scalar
LMP_STYLE_GLOBAL	LMP_TYPE_VECTOR	double *	Copy of global vector element at index nrow
LMP_STYLE_GLOBAL	LMP_TYPE_ARRAY	double *	Copy of global array element at nrow, ncol
LMP_STYLE_GLOBAL	LMP_SIZE_VECTOR	int *	Length of global vector
LMP_STYLE_GLOBAL	LMP_SIZE_ROWS	int *	Rows in global array
LMP_STYLE_GLOBAL	LMP_SIZE_COLS	int *	Columns in global array
LMP_STYLE_ATOM	LMP_TYPE_VECTOR	double *	Per-atom value
LMP_STYLE_ATOM	LMP_TYPE_ARRAY	double **	Per-atom vector
LMP_STYLE_ATOM	LMP_SIZE_COLS	int *	Columns of per-atom array, 0 if vector
LMP_STYLE_LOCAL	LMP_TYPE_VECTOR	double *	Local data vector
LMP_STYLE_LOCAL	LMP_TYPE_ARRAY	double **	Local data array
LMP_STYLE_LOCAL	LMP_SIZE_ROWS	int *	Number of local data rows
LMP_STYLE_LOCAL	LMP_SIZE_COLS	int *	Number of local data columns

i Note

LAMMPS cannot easily check if it is valid to access the data, so it may fail with an error and return a NULL pointer. The caller has to avoid such an error.

Warning

The pointers returned by this function for per-atom or local data are generally not persistent, since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation of the fix. It is thus advisable to re-invoke this function before the data is accessed, or make a copy, if the data shall be used after other LAMMPS commands have been issued.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **id** – string with ID of the fix
- **style** – constant indicating the style of data requested (global, per-atom, or local)
- **type** – constant indicating type of data (scalar, vector, or array) or size of rows or columns
- **nrow** – row index (only used for global vectors and arrays), zero-based
- **ncol** – column index (only used for global arrays), zero-based

Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

```
int lammers_extract_variable_datatype(void *handle, const char *name)
```

Get data type of a *LAMMPS* variable.

Added in version 3Nov2022.

This function returns an integer that encodes the data type of the variable with the specified name. See *_LMP_VAR_CONST* for valid values. Callers of *lammers_extract_variable()* can use this information to decide how to cast the `void *` pointer and access the data.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – string with the name of the extracted variable

Returns

integer constant encoding the data type of the property or -1 if not found.

```
void *lammers_extract_variable(void *handle, const char *name, const char *group)
```

Get pointer to data from a *LAMMPS* variable.

This function returns a pointer to data from a LAMMPS *variable command* identified by its name. When the variable is either an *equal*-style compatible variable, a *vector*-style variable, or an *atom*-style variable, the variable is evaluated and the corresponding value(s) returned. Variables of style *internal* are compatible with *equal*-style variables and so are *python*-style variables, if they return a numeric value. For other variable styles, their string value is returned. The function returns NULL when a variable of the provided *name* is not found or of an incompatible style. The *group* argument is only used for *atom*-style variables and ignored otherwise, with one exception: for style *vector*, if *group* is “GET_VECTOR_SIZE”, the returned pointer will yield the length of

the vector to be returned when dereferenced. This pointer must be deallocated after the value is read to avoid a memory leak. If *group* is set to NULL when extracting data from an *atom*-style variable, the group is assumed to be “all”.

When requesting data from an *equal*-style or compatible variable this function allocates storage for a single double value, copies the returned value to it, and returns a pointer to the location of the copy. Therefore the allocated storage needs to be freed after its use to avoid a memory leak. Example:

```
double *dptr = (double *) lammps_extract_variable(handle, name, NULL);
double value = *dptr;
lammps_free((void *)dptr);
```

For *atom*-style variables, the return value is a pointer to an allocated block of storage of double of the length `atom->nlocal`. Since the data returned are a copy, the location will persist, but its content will not be updated in case the variable is re-evaluated. To avoid a memory leak, this pointer needs to be freed after use in the calling program.

For *vector*-style variables, the returned pointer points to actual LAMMPS data and thus it should **not** be deallocated. Its length depends on the variable, compute, or fix data used to construct the *vector*-style variable. This length can be fetched by calling this function with *group* set to a non-NULL pointer (NULL returns the vector). In that case it will return the vector length as an allocated int pointer cast to a void * pointer. That pointer can be recast and dereferenced to an integer yielding the length of the vector. This pointer must be deallocated when finished with it to avoid memory leaks. Example:

```
double *vectvals = (double *) lammps_extract_variable(handle, name, NULL);
int *intptr = (int *) lammps_extract_variable(handle, name, 1);
int vectlen = *intptr;
lammps_free((void *)intptr);
```

For other variable styles the returned pointer needs to be cast to a char pointer and it should **not** be deallocated. Example:

```
const char *cptr = (const char *) lammps_extract_variable(handle, name, NULL);
printf("The value of variable %s is %s\n", name, cptr);
```

Note

LAMMPS cannot easily check if it is valid to access the data referenced by the variables (e.g., computes, fixes, or thermodynamic info), so it may fail with an error. The caller has to make certain that the data is extracted only when it safe to evaluate the variable and thus an error or crash are avoided.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – name of the variable
- **group** – group-ID for atom style variable or NULL or non-NULL to get vector length

Returns

pointer (cast to void *) to the location of the requested data or NULL if not found.

int **lammmps_set_variable**(void *handle, const char *name, const char *str)

Set the value of a string-style variable.

Deprecated since version 7Feb2024.

This function assigns a new value from the string *str* to the string-style variable *name*. This is a way to directly change the string value of a LAMMPS variable that was previous defined with a *variable name string* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or if it is not a string-style variable, otherwise 0.

 Warning

This function is deprecated and *lammmps_set_string_variable()* should be used instead.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – name of the variable
- **str** – new value of the variable

Returns

0 on success or -1 on failure

int **lammmps_set_string_variable**(void *handle, const char *name, const char *str)

Set the value of a string-style variable.

Added in version 7Feb2024.

This function assigns a new value from the string *str* to the string-style variable *name*. This is a way to directly change the string value of a LAMMPS variable that was previous defined with a *variable name string* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or if it is not a string-style variable, otherwise 0.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – name of the variable
- **str** – new value of the variable

Returns

0 on success or -1 on failure

int **lammmps_set_internal_variable**(void *handle, const char *name, double value)

Set the value of an internal-style variable.

Added in version 7Feb2024.

This function assigns a new value from the floating point number *value* to the internal-style variable *name*. This is a way to directly change the numerical value of such a LAMMPS variable that was previous defined with a *variable name internal* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or is not an internal-style variable, otherwise 0.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – name of the variable
- **value** – new value of the variable

Returns

0 on success or -1 on failure

int **lammers_variable_info**(void *handle, int idx, char *buf, int bufsize)

Retrieve informational string for a variable.

Added in version 21Nov2023.

This function copies a string with human readable information about a defined variable: name, style, current value(s) into the provided C-style string buffer. That is the same info as produced by the *info variables* command. The length of the buffer must be provided as *buf_size* argument. If the info exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **idx** – index of the variable (0 <= idx < nvar)
- **buffer** – string buffer to copy the info to
- **buf_size** – size of the provided string buffer

Returns

1 if successful, otherwise 0

double **lammers_eval**(void *handle, const char *expr)

Evaluate an immediate variable expression

Added in version 4Feb2025.

This function takes a string with an expression that can be used for *equal style variables*, evaluates it and returns the resulting (scalar) value as a floating point number.

See also

lammers_expand()

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **expr** – string with expression

Returns

result from expression

void **lammops_clearstep_compute**(void *handle)

Clear whether a compute has been invoked.

Added in version 4Feb2025: This function clears the invoked flag of all computes. Called everywhere that computes are used, before computes are invoked. The invoked flag is used to avoid re-invoking same compute multiple times and to flag computes that store invocation times as having been invoked

See also

[*lammops_addstep_compute_all\(\)*](#) [*lammops_addstep_compute\(\)*](#)

Parameters

handle – pointer to a previously created [*LAMMPS*](#) instance cast to void *.

void **lammops_addstep_compute_all**(void *handle, void *nextstep)

Add next timestep to all computes

Added in version 4Feb2025: loop over all computes schedule next invocation for those that store invocation times called when not sure what computes will be needed on newstep do not loop only over n_timeflag, since may not be set yet

See also

[*lammops_clearstep_compute\(\)*](#) [*lammops_addstep_compute\(\)*](#)

Parameters

- **handle** – pointer to a previously created [*LAMMPS*](#) instance cast to void *.
 - **newstep** – pointer to bigint of next timestep the compute will be invoked
-

void **lammops_addstep_compute**(void *handle, void *nextstep)

Add next timestep to compute if it has been invoked in the current timestep

Added in version 4Feb2025: loop over computes that store invocation times if its invoked flag set on this timestep, schedule next invocation called everywhere that computes are used, after computes are invoked

See also

[*lammops_addstep_compute_all\(\)*](#) [*lammops_clearstep_compute\(\)*](#)

Parameters

- **handle** – pointer to a previously created [*LAMMPS*](#) instance cast to void *.
 - **newstep** – next timestep the compute will be invoked
-

enum LAMMPS_NS::multitype::_LMP_DATATYPE_CONST

Data type constants for extracting data from atoms, computes and fixes

This enum must be kept in sync with the corresponding enum or constants in `python/lammps/constants.py`, `fortran/lammps.f90`, `tools/swig/lammps.i`, `src/library.h`, and `examples/COUPLE/plugin/liblammpsplugin.h`

Values:

enumerator **LAMMPS_NONE**

no data type assigned (yet)

enumerator **LAMMPS_INT**

32-bit integer (array)

enumerator **LAMMPS_INT_2D**

two-dimensional 32-bit integer array

enumerator **LAMMPS_DOUBLE**

64-bit double (array)

enumerator **LAMMPS_DOUBLE_2D**

two-dimensional 64-bit double array

enumerator **LAMMPS_INT64**

64-bit integer (array)

enumerator **LAMMPS_INT64_2D**

two-dimensional 64-bit integer array

enumerator **LAMMPS_STRING**

C-String

enum **_LMP_STYLE_CONST**

Style constants for extracting data from computes and fixes.

Must be kept in sync with the equivalent constants in `python/lammps/constants.py`, `fortran/lammps.f90`, `tools/swig/lammps.i`, and `examples/COUPLE/plugin/liblammpsplugin.h`

Values:

enumerator **LMP_STYLE_GLOBAL**

return global data

enumerator **LMP_STYLE_ATOM**

return per-atom data

enumerator **LMP_STYLE_LOCAL**

return local data

enum `_LMP_TYPE_CONST`

Type and size constants for extracting data from computes and fixes.

Must be kept in sync with the equivalent constants in `python/lammps/constants.py`, `fortran/lammps.f90`, `tools/swig/lammps.i`, and `examples/COUPLE/plugin/liblammpsplugin.h`

Values:

enumerator **`LMP_TYPE_SCALAR`**

return scalar

enumerator **`LMP_TYPE_VECTOR`**

return vector

enumerator **`LMP_TYPE_ARRAY`**

return array

enumerator **`LMP_SIZE_VECTOR`**

return length of vector

enumerator **`LMP_SIZE_ROWS`**

return number of rows

enumerator **`LMP_SIZE_COLS`**

return number of columns

enum `_LMP_VAR_CONST`

Variable style constants for extracting data from variables.

Must be kept in sync with the equivalent constants in `python/lammps/constants.py`, `fortran/lammps.f90`, `tools/swig/lammps.i`, and `examples/COUPLE/plugin/liblammpsplugin.h`

Values:

enumerator **`LMP_VAR_EQUAL`**

compatible with equal-style variables

enumerator **`LMP_VAR_ATOM`**

compatible with atom-style variables

enumerator **`LMP_VAR_VECTOR`**

compatible with vector-style variables

enumerator **`LMP_VAR_STRING`**

return value will be a string (catch-all)

1.1.6 Scatter/gather operations

This section has functions which gather per-atom data from one or more processors into a contiguous global list ordered by atom ID. The same list is returned to all calling processors. It also contains functions which scatter per-atom data from a contiguous global list across the processors that own those atom IDs. It also has a `create_atoms()` function which can create new atoms by scattering them appropriately to owning processors in the LAMMPS spatial decomposition.

It documents the following functions:

- `lammps_gather_atoms()`
- `lammps_gather_atoms_concat()`
- `lammps_gather_atoms_subset()`
- `lammps_scatter_atoms()`
- `lammps_scatter_atoms_subset()`
- `lammps_gather_bonds()`
- `lammps_gather_angles()`
- `lammps_gather_dihedrals()`
- `lammps_gather_impropers()`
- `lammps_gather()`
- `lammps_gather_concat()`
- `lammps_gather_subset()`
- `lammps_scatter()`
- `lammps_scatter_subset()`
- `lammps_create_atoms()`
- `lammps_create_molecule()`

void **lammps_gather_atoms**(void *handle, const char *name, int type, int count, void *data)

Gather the named atom-based entity for all atoms across all processes, in order.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, which requires consecutive atom IDs (1 to *natoms*). If you need a similar array but have non-consecutive atom IDs, see `lammps_gather_atoms_concat()`; for a similar array but for a subset of atoms, see `lammps_gather_atoms_subset()`.

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = *x*[0][0], *x*[0][1], *x*[0][2], *x*[1][0], *x*[1][1], *x*[1][2], *x*[2][0], ...); *data* must be pre-allocated by the caller to length (*count* × *natoms*), as queried by `lammps_get_natoms()`, `lammps_extract_global()`, or `lammps_extract_setting()`.

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined and consecutive.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., *x* or *q*)
- **dtype** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you want a single image flag unpacked into (*x,y,z*) components.
- **data** – per-atom values packed in a 1-dimensional array of length *natoms* * *count*.

```
void lammgs_gather_atoms_concat(void *handle, const char *name, int type, int count, void *data)
```

Gather the named atom-based entity for all atoms across all processes, unordered.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be a concatenation of chunks from each processor's owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each atom, you can do another *lammgs_gather_atoms_concat()* call with *name* set to *id*. If you have consecutive IDs and want the data to be in order, use *lammgs_gather_atoms()*; for a similar array but for a subset of atoms, use *lammgs_gather_atoms_subset()*.

The *data* array will be in groups of *count* values, with *natoms* groups total, but not in order by atom ID (e.g., if *name* is *x* and *count* is 3, then *data* might be something like *x*[10][0], *x*[10][1], *x*[10][2], *x*[2][0], *x*[2][1], *x*[2][2], *x*[4][0], ...); *data* must be pre-allocated by the caller to length (*count* × *natoms*), as queried by *lammgs_get_natoms()*, *lammgs_extract_global()*, or *lammgs_extract_setting()*.

Restrictions

This function is not compatible with *-DLAMMPS_BIGBIG*.

Atom IDs must be defined.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., *x* or *q*)
- **dtype** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with “image” if you want single image flags unpacked into (*x,y,z*)
- **data** – per-atom values packed in a 1-dimensional array of length *natoms* * *count*.

```
void lammgs_gather_atoms_subset(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)
```

Gather the named atom-based entity for a subset of atoms.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use `lammgs_gather_atoms()` or `lammgs_gather_atoms_concat()`.

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is {100, 57, 210}, then *data* might look like {x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2], x[210][0], ...}); *ids* must be provided by the user with length *ndata*, and *data* must be pre-allocated by the caller to length (*count* × *ndata*).

i Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., *x* or *q*)
- **dtype** – 0 for *int* values, 1 for *double* values
- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with “image” if you want single image flags unpacked into (*x,y,z*)
- **ndata** – number of atoms for which to return data (can be all of them)
- **ids** – list of *ndata* atom IDs for which to return data
- **data** – per-atom values packed in a 1-dimensional array of length *ndata* * *count*.

void **lammgs_scatter_atoms**(void *handle, const char *name, int type, int count, void *data)

Scatter the named atom-based entities in *data* to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use `lammgs_scatter_atoms_subset()` to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = {x[0][0], x[0][1], x[0][2], x[1][0], x[1][1], x[1][2], x[2][0], ...}); *data* must be of length (*count* × *natoms*).

i Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined, must be consecutive, and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., *x* or *q*)
- **dtype** – 0 for `int` values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you have a single image flag packed into (*x,y,z*) components.
- **data** – per-atom values packed in a one-dimensional array of length *natoms* * *count*.

```
void lammops_scatter_atoms_subset(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)
```

Scatter the named atom-based entities in *data* from a subset of atoms to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array. Use *lammops_scatter_atoms()* to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of *count* values, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array {*x*[1][0], *x*[1][1], *x*[1][2], *x*[100][0], *x*[100][1], *x*[100][2], *x*[57][0], *x*[57][1], *x*[57][2]}, then *count* = 3, *ndata* = 3, and *ids* would be {1, 100, 57}.

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., *x* or *q*)
- **dtype** – 0 for `int` values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *dtype* or *q*, 3 for *x* or *f*); use *count* = 3 with “image” if you have all the image flags packed into (*xyz*)
- **ndata** – number of atoms listed in *ids* and *data* arrays
- **ids** – list of *ndata* atom IDs to scatter data to
- **data** – per-atom values packed in a 1-dimensional array of length *ndata* * *count*.

```
void lammops_gather_bonds(void *handle, void *data)
```

Gather type and constituent atom info for all bonds

Added in version 28Jul2021.

This function copies the list of all bonds into a buffer provided by the calling code. The buffer will be filled with bond type, bond atom 1, bond atom 2 for each bond. Thus the buffer has to be allocated to the dimension of 3 times the **total** number of bonds times the size of the LAMMPS “tagint” type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling `lammps_extract_setting()` with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** bonds in the system.

Below is a brief C code demonstrating accessing this collected bond information.

```
#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, nbonds;
    void *handle, *bonds;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.some_input");

    tagintsize = lammps_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        nbonds = *(int32_t *)lammps_extract_global(handle, "nbonds");
    else
        nbonds = *(int64_t *)lammps_extract_global(handle, "nbonds");
    bonds = malloc(nbonds * 3 * tagintsize);

    lammps_gather_bonds(handle, bonds);

    if (lammps_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *bonds_real = (int32_t *)bonds;
            for (i = 0; i < nbonds; ++i) {
                printf("bond % 4ld: type = %d, atoms: % 4d % 4d\n", i,
                    bonds_real[3*i], bonds_real[3*i+1], bonds_real[3*i+2]);
            }
        } else {
            int64_t *bonds_real = (int64_t *)bonds;
            for (i = 0; i < nbonds; ++i) {
                printf("bond % 4ld: type = %ld, atoms: % 4ld % 4ld\n", i,
                    bonds_real[3*i], bonds_real[3*i+1], bonds_real[3*i+2]);
            }
        }
    }

    lammps_close(handle);
    lammps_mpi_finalize();
}
```

(continues on next page)

(continued from previous page)

```

    free(bonds);
    return 0;
}

```

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **data** – pointer to data to copy the result to

void **lammgs_gather_angles**(void *handle, void *data)

Gather type and constituent atom info for all angles

Added in version 8Feb2023.

This function copies the list of all angles into a buffer provided by the calling code. The buffer will be filled with angle type, angle atom 1, angle atom 2, angle atom 3 for each angle. Thus the buffer has to be allocated to the dimension of 4 times the **total** number of angles times the size of the LAMMPS “tagint” type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling *lammgs_extract_setting()* with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** angles in the system.

Below is a brief C code demonstrating accessing this collected angle information.

```

#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, nangles;
    void *handle, *angles;

    handle = lammgs_open_no_mpi(0, NULL, NULL);
    lammgs_file(handle, "in.some_input");

    tagintsize = lammgs_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        nangles = *(int32_t *)lammgs_extract_global(handle, "nangles");
    else
        nangles = *(int64_t *)lammgs_extract_global(handle, "nangles");
    angles = malloc(nangles * 4 * tagintsize);

    lammgs_gather_angles(handle, angles);
}

```

(continues on next page)

(continued from previous page)

```

    if (lammmps_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *angles_real = (int32_t *)angles;
            for (i = 0; i < nangles; ++i) {
                printf("angle % 4ld: type = %d, atoms: % 4d % 4d % 4d\n", i,
                    angles_real[4*i], angles_real[4*i+1], angles_real[4*i+2],
↪ angles_real[4*i+3]);
            }
        } else {
            int64_t *angles_real = (int64_t *)angles;
            for (i = 0; i < nangles; ++i) {
                printf("angle % 4ld: type = %ld, atoms: % 4ld % 4ld % 4ld\n", i,
                    angles_real[4*i], angles_real[4*i+1], angles_real[4*i+2],
↪ angles_real[4*i+3]);
            }
        }
    }

    lammmps_close(handle);
    lammmps_mpi_finalize();
    free(angles);
    return 0;
}

```

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **data** – pointer to data to copy the result to

void **lammmps_gather_dihedrals**(void *handle, void *data)

Gather type and constituent atom info for all dihedrals

Added in version 8Feb2023.

This function copies the list of all dihedrals into a buffer provided by the calling code. The buffer will be filled with dihedral type, dihedral atom 1, dihedral atom 2, dihedral atom 3, dihedral atom 4 for each dihedral. Thus the buffer has to be allocated to the dimension of 5 times the **total** number of dihedrals times the size of the LAMMPS “tagint” type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling *lammmps_extract_setting()* with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** dihedrals in the system.

Below is a brief C code demonstrating accessing this collected dihedral information.

```

#include "library.h"

#include <stdint.h>
#include <stdio.h>

```

(continues on next page)

(continued from previous page)

```

#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, ndihedrals;
    void *handle, *dihedrals;

    }

    lammps_close(handle);
    lammps_mpi_finalize();
    free(dihedrals);
    return 0;
}

```

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **data** – pointer to data to copy the result to

```
void lammgs_gather_impropers(void *handle, void *data)
```

Gather type and constituent atom info for all impropers

Added in version 8Feb2023.

This function copies the list of all impropers into a buffer provided by the calling code. The buffer will be filled with improper type, improper atom 1, improper atom 2, improper atom 3, improper atom 4 for each improper. Thus the buffer has to be allocated to the dimension of 5 times the **total** number of impropers times the size of the LAMMPS “tagint” type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling `lammgs_extract_setting()` with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** impropers in the system.

Below is a brief C code demonstrating accessing this collected improper information.

```
#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, nimpropers;
    void *handle, *impropers;

    handle = lammgs_open_no_mpi(0, NULL, NULL);
    lammgs_file(handle, "in.some_input");

    tagintsize = lammgs_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        nimpropers = *(int32_t *)lammgs_extract_global(handle, "nimpropers");
    else
        nimpropers = *(int64_t *)lammgs_extract_global(handle, "nimpropers");
    impropers = malloc(nimpropers * 5 * tagintsize);

    lammgs_gather_impropers(handle, impropers);

    if (lammgs_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *impropers_real = (int32_t *)impropers;
            for (i = 0; i < nimpropers; ++i) {
                printf("improper % 4ld: type = %d, atoms: % 4d % 4d % 4d % 4d\n",
→i,
                    impropers_real[5*i], impropers_real[5*i+1], impropers_
→real[5*i+2], impropers_real[5*i+3], impropers_real[5*i+4]);
            }
        } else {
            int64_t *impropers_real = (int64_t *)impropers;
            for (i = 0; i < nimpropers; ++i) {
                printf("improper % 4ld: type = %ld, atoms: % 4ld % 4ld % 4ld %_
(continues on next page)
```

(continued from previous page)

```

→41d\n",i,
                impropers_real[5*i], impropers_real[5*i+1], impropers_
→real[5*i+2], impropers_real[5*i+3], impropers_real[5*i+4]);
        }
    }
}

lammps_close(handle);
lammps_mpi_finalize();
free(impropers);
return 0;
}

```

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **data** – pointer to data to copy the result to

void **lammps_gather**(void *handle, const char *name, int type, int count, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, in order by atom ID.

This subroutine gathers data from all processes and stores them in a one-dimensional array allocated by the user. The array *data* will be ordered by atom ID, which requires consecutive IDs (1 to *natoms*). If you need a similar array but for non-consecutive atom IDs, see [lammps_gather_concat\(\)](#); for a similar array but for a subset of atoms, see [lammps_gather_subset\(\)](#).

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x*, then *data* is {x[0][0], x[0][1], x[0][2], x[1][0], x[1][1], x[1][2], x[2][0], ...}); *data* must be pre-allocated by the caller to the correct length (*count* × *natoms*), as queried by [lammps_get_natoms\(\)](#), [lammps_extract_global\(\)](#), or [lammps_extract_setting\(\)](#).

This function will return an error if fix or compute data are requested and the fix or compute ID given does not have per-atom data.

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined and must be consecutive.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **dtype** – 0 for int values, 1 for double values

- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (x,y,z) components.
- **data** – per-atom values packed into a one-dimensional array of length *natoms* * *count*.

void **lammops_gather_concat**(void *handle, const char *name, int type, int count, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, unordered.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be a concatenation of chunks from each processor's owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each atom, you can do another call to either *lammops_gather_atoms_concat()* or *lammops_gather_concat()* with *name* set to *id*. If you have consecutive IDs and want the data to be in order, use *lammops_gather()*; for a similar array but for a subset of atoms, use *lammops_gather_subset()*.

The *data* array will be in groups of *count* values, with *natoms* groups total, but not in order by atom ID (e.g., if *name* is *x* and *count* is 3, then *data* might be something like {x[10][0], x[10][1], x[10][2], x[2][0], x[2][1], x[2][2], x[4][0], ...}); *data* must be pre-allocated by the caller to length (*count* × *natoms*), as queried by *lammops_get_natoms()*, *lammops_extract_global()*, or *lammops_extract_setting()*.

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined.

The total number of atoms must be less than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **dtype** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (x,y,z) components.
- **data** – per-atom values packed into a one-dimensional array of length *natoms* * *count*.

void **lammops_gather_subset**(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes for a subset of atoms.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use *lammops_gather()* or *lammops_gather_concat()*.

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is {100, 57, 210}, then *data* might look like {x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2], x[210][0], ...}); *ids* must be provided by the user with length *ndata*, and *data* must be pre-allocated by the caller to length (*count* × *ndata*).

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **dtype** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (x,y,z) components.
- **ndata** – number of atoms for which to return data (can be all of them)
- **ids** – list of *ndata* atom IDs for which to return data
- **data** – per-atom values packed into a one-dimensional array of length *ndata* * *count*.

void **lammops_scatter**(void *handle, const char *name, int type, int count, void *data)

Scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entity in *data* to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use *lammops_scatter_subset()* to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = {x[0][0], x[0][1], x[0][2], x[1][0], x[1][1], x[1][2], x[2][0], ...}); *data* must be of length (*count* × *natoms*).

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined, must be consecutive, and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance

- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **dtype** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you have a single image flag packed into (*x,y,z*) components.
- **data** – per-atom values packed in a one-dimensional array of length *natoms* * *count*.

void **lammops_scatter_subset**(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities in *data* from a subset of atoms to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array. Use *lammops_scatter()* to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of *count* values, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array {x[1][0], x[1][1], x[1][2], x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2]}, then *count* = 3, *ndata* = 3, and *ids* would be {1, 100, 57}.

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **dtype** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with “image” if you want single image flags unpacked into (*x,y,z*)
- **ndata** – number of atoms listed in *ids* and *data* arrays
- **ids** – list of *ndata* atom IDs to scatter data to
- **data** – per-atom values packed in a 1-dimensional array of length *ndata* * *count*.

```
int lammops_create_atoms(void *handle, int n, const int *id, const int *type, const double *x, const double *v,
                        const int *image, int bexpand)
```

Create N atoms from list of coordinates

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```
int lammops_create_atoms(void *handle, int n, int64_t *id, int *type, double *x, double *v, int64_t *image, int bexpand);
```

This function creates additional atoms from a given list of coordinates and a list of atom types. Additionally the atom-IDs, velocities, and image flags may be provided. If atom-IDs are not provided, they will be automatically created as a sequence following the largest existing atom-ID.

This function is useful to add atoms to a simulation or - in tandem with `lammops_reset_box()` - to restore a previously extracted and saved state of a simulation. Additional properties for the new atoms can then be assigned via the `lammops_scatter_atoms()` `lammops_extract_atom()` functions.

For non-periodic boundaries, atoms will **not** be created that have coordinates outside the box unless it is a shrink-wrap boundary and the shrinkexceed flag has been set to a non-zero value. For periodic boundaries atoms will be wrapped back into the simulation cell and its image flags adjusted accordingly, unless explicit image flags are provided.

The function returns the number of atoms created or -1 on failure (e.g., when called before as box has been created).

Coordinates and velocities have to be given in a 1d-array in the order X(1), Y(1), Z(1), X(2), Y(2), Z(2), ..., X(N), Y(N), Z(N).

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **n** – number of atoms, N, to be added to the system
- **id** – pointer to N atom IDs; NULL will generate IDs
- **type** – pointer to N atom types (required)
- **x** – pointer to 3N doubles with x-,y-,z- positions of the new atoms (required)
- **v** – pointer to 3N doubles with x-,y-,z- velocities of the new atoms (set to 0.0 if NULL)
- **image** – pointer to N imageint sets of image flags, or NULL
- **bexpand** – if 1, atoms outside of shrink-wrap boundaries will still be created and not dropped and the box extended

Returns

number of atoms created on success; -1 on failure (no box, no atom IDs, etc.)

```
void lammops_create_molecule(void *handle, const char *id, const char *json)
```

Create new molecule template from JSON data provided as C-style string

Added in version 22Jul2025.

This function creates a new molecule template similar to the *molecule command*, but uses JSON data passed as a C-style string instead of reading it from a file.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance
- **id** – molecule-ID
- **jsonstr** – molecule data in JSON format as C-style string

1.1.7 Neighbor list access

The following functions enable access to neighbor lists generated by LAMMPS or querying of their properties:

- *lammops_find_compute_neighlist()*
- *lammops_find_fix_neighlist()*
- *lammops_find_pair_neighlist()*
- *lammops_neighlist_num_elements()*
- *lammops_neighlist_element_neighbors()*

int **lammops_find_compute_neighlist**(void *handle, const char *id, int request)

Find index of a neighbor list requested by a compute

The neighbor list request from a compute is identified by the compute ID and the request ID. The request ID is typically 0, but will be

0 in case a compute has multiple neighbor list requests.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **id** – Identifier of compute instance
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same compute

Returns

return neighbor list index if found, otherwise -1

int **lammops_find_fix_neighlist**(void *handle, const char *id, int request)

Find index of a neighbor list requested by a fix

The neighbor list request from a fix is identified by the fix ID and the request ID. The request ID is typically 0, but will be > 0 in case a fix has multiple neighbor list requests.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **id** – Identifier of fix instance
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same fix

Returns

return neighbor list index if found, otherwise -1

```
int lammops_find_pair_neighlist(void *handle, const char *style, int exact, int nsub, int request)
```

Find index of a neighbor list requested by a pair style

This function determines which of the available neighbor lists for pair styles matches the given conditions. It first matches the style name. If exact is 1 the name must match exactly, if exact is 0, a regular expression or sub-string match is done. If the pair style is hybrid or hybrid/overlay the style is matched against the sub styles instead. If a the same pair style is used multiple times as a sub-style, the nsub argument must be > 0 and represents the nth instance of the sub-style (same as for the pair_coeff command, for example). In that case nsub=0 will not produce a match and this function will return -1.

The final condition to be checked is the request ID (reqid). This will normally be 0, but some pair styles request multiple neighbor lists and set the request ID to a value > 0.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **style** – String used to search for pair style instance
- **exact** – Flag to control whether style should match exactly or only a regular expression / sub-string match is applied.
- **nsub** – match nsub-th hybrid sub-style instance of the same style
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same pair style instance

Returns

return neighbor list index if found, otherwise -1

```
int lammops_neighlist_num_elements(void *handle, int idx)
```

Return the number of entries in the neighbor list with given index

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **idx** – neighbor list index

Returns

return number of entries in neighbor list, -1 if idx is not a valid index

```
void lammops_neighlist_element_neighbors(void *handle, int idx, int element, int *iatom, int *numneigh, int **neighbors)
```

Return atom local index, number of neighbors, and array of neighbor local atom indices of neighbor list entry

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **idx** – index of this neighbor list in the list of all neighbor lists
- **element** – index of this neighbor list entry
- **iatom** – [out] local atom index (i.e. in the range [0, nlocal + nghost), -1 if invalid idx or element value
- **numneigh** – [out] number of neighbors of atom iatom or 0
- **neighbors** – [out] pointer to array of neighbor atom local indices or NULL

1.1.8 Configuration information

This section documents the following functions:

- `lammmps_version()`
- `lammmps_get_os_info()`
- `lammmps_config_has_mpi_support()`
- `lammmps_config_has_omp_support()`
- `lammmps_config_has_gzip_support()`
- `lammmps_config_has_png_support()`
- `lammmps_config_has_jpeg_support()`
- `lammmps_config_has_ffmpeg_support()`
- `lammmps_config_has_exceptions()`
- `lammmps_config_has_package()`
- `lammmps_config_package_count()`
- `lammmps_config_package_name()`
- `lammmps_config_accelerator()`
- `lammmps_has_gpu_device()`
- `lammmps_gpu_device_info()`
- `lammmps_has_style()`
- `lammmps_style_count()`
- `lammmps_style_name()`
- `lammmps_has_id()`
- `lammmps_id_count()`
- `lammmps_id_name()`

These library functions can be used to query the LAMMPS library for compile time settings and included packages and styles. This enables programs that use the library interface to determine whether the linked LAMMPS library is compatible with the requirements of the application without crashing during the LAMMPS functions (e.g. due to missing pair styles from packages) or to choose between different options (e.g. whether to use `lj/cut`, `lj/cut/opt`, `lj/cut/omp` or `lj/cut/intel`). Most of the functions can be called directly without first creating a LAMMPS instance. While crashes within LAMMPS may be recovered from by enabling *exceptions*, avoiding them proactively is a safer approach.

Listing 1: Example for using configuration settings functions

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
```

(continues on next page)

(continued from previous page)

```

handle = lammps_open_no_mpi(0, NULL, NULL);
lammps_file(handle, "in.missing");
if (lammps_has_error(handle)) {
    char errmsg[256];
    int errtype;
    errtype = lammps_get_last_error_message(handle, errmsg, 256);
    fprintf(stderr, "LAMMPS failed with error: %s\n", errmsg);
    return 1;
}
/* write compressed dump file depending on available of options */
if (lammps_has_style(handle, "dump", "atom/zstd")) {
    lammps_command(handle, "dump d1 all atom/zstd 100 dump.zst");
} else if (lammps_has_style(handle, "dump", "atom/gz")) {
    lammps_command(handle, "dump d1 all atom/gz 100 dump.gz");
} else if (lammps_config_has_gzip_support()) {
    lammps_command(handle, "dump d1 all atom 100 dump.gz");
} else {
    lammps_command(handle, "dump d1 all atom 100 dump");
}
lammps_close(handle);
return 0;
}

```

int **lammps_version**(void *handle)

Get numerical representation of the *LAMMPS* version date.

The *lammps_version()* function returns an integer representing the version of the LAMMPS code in the format YYYYMMDD. This can be used to implement backward compatibility in software using the LAMMPS library interface. The specific format guarantees, that this version number is growing with every new LAMMPS release.

Parameters

handle – pointer to a previously created *LAMMPS* instance

Returns

an integer representing the version data in the format YYYYMMDD

void **lammps_get_os_info**(char *buffer, int buf_size)

Get operating system and architecture information

Added in version 9Oct2020.

The *lammps_get_os_info()* function can be used to retrieve detailed information about the hosting operating system and compiler/runtime.

A suitable buffer for a C-style string has to be provided and its length. The assembled text will be truncated to not overflow this buffer. The string is typically a few hundred bytes long.

Parameters

- **buffer** – string buffer to copy the information to
- **buf_size** – size of the provided string buffer

```
int lammops_config_has_mpi_support()
```

This function is used to query whether *LAMMPS* was compiled with a real MPI library or in serial. For the real MPI library it reports the size of the MPI communicator in bytes (4 or 8), which allows to check for compatibility with a hosting code.

Returns

0 when compiled with MPI STUBS, otherwise the MPI_Comm size in bytes

```
int lammops_config_has_omp_support()
```

This function is used to query whether *LAMMPS* was compiled with OpenMP enabled.

Added in version 10Sep2025.

See also

lammops_config_has_mpi_support()

Returns

1 when compiled with OpenMP enabled, otherwise 0

```
int lammops_config_has_gzip_support()
```

Check if the *LAMMPS* library supports reading or writing compressed files via a pipe to gzip or similar compression programs

Several LAMMPS commands (e.g., *read_data command*, *write_data command*, *dump styles atom, custom, and xyz*) support reading and writing compressed files via creating a pipe to the gzip program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether ``gzip`` or any other supported compression programs themselves are installed and usable.

Returns

1 if yes, otherwise 0

```
int lammops_config_has_png_support()
```

Check if the *LAMMPS* library supports writing PNG format images

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the *PNG image file format* is available in the current LAMMPS library.

Returns

1 if yes, otherwise 0

```
int lammops_config_has_jpeg_support()
```

Check if the *LAMMPS* library supports writing JPEG format images

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the *JPEG image file format* is available in the current LAMMPS library.

Returns

1 if yes, otherwise 0

int **lammops_config_has_ffmpeg_support()**

Check if the *LAMMPS* library supports creating movie files via a pipe to ffmpeg

The LAMMPS *dump style movie* supports generating movies from images on-the-fly via creating a pipe to the *ffmpeg* program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether the *ffmpeg* itself is installed and usable.

Returns

1 if yes, otherwise 0

int **lammops_config_has_exceptions()**

Check whether *LAMMPS* errors will throw C++ exceptions.

Deprecated since version 21Nov2023: LAMMPS has now exceptions always enabled, so this function will now always return 1 and can be removed from applications using the library interface.

In case of an error, LAMMPS will either abort or throw a C++ exception. The latter has to be *enabled at compile time*. This function checks if exceptions were enabled.

When using the library interface with C++ exceptions enabled, the library interface functions will “catch” them and the error status can then be checked by calling *lammops_has_error()* and the most recent error message can be retrieved via *lammops_get_last_error_message()*. This can allow to restart a calculation or delete and recreate the LAMMPS instance when C++ exceptions are enabled. One application of using exceptions this way is the *LAMMPS-GUI*. If C++ exceptions are disabled and an error happens during a call to LAMMPS, the application will terminate.

Returns

1 if yes, otherwise 0

int **lammops_config_has_package**(const char*)

Check whether a specific package has been included in *LAMMPS*

This function checks whether the LAMMPS library in use includes the specific *LAMMPS package* provided as argument.

Parameters

name – string with the name of the package

Returns

1 if included, 0 if not.

int **lammops_config_package_count**()

Count the number of installed packages in the *LAMMPS* library.

This function counts how many *LAMMPS packages* are included in the LAMMPS library in use.

Returns

number of packages included

int **lammops_config_package_name**(int, char*, int)

Get the name of a package in the list of installed packages in the *LAMMPS* library.

This function copies the name of the package with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1;

Parameters

- **idx** – index of the package in the list of included packages ($0 \leq \text{idx} < \text{package count}$)
- **buffer** – string buffer to copy the name of the package to
- **buf_size** – size of the provided string buffer

Returns

1 if successful, otherwise 0

int **lammops_config_accelerator**(const char*, const char*, const char*)

Check for compile time settings in accelerator packages included in *LAMMPS*.

This function checks availability of compile time settings of included *accelerator packages* in LAMMPS. Supported packages names are “GPU”, “KOKKOS”, “INTEL”, and “OPENMP”. Supported categories are “api” with possible settings “cuda”, “hip”, “phi”, “pthreads”, “opencl”, “openmp”, and “serial”, and “precision” with possible settings “double”, “mixed”, and “single”. If the combination of package, category, and setting is available, the function returns 1, otherwise 0.

Parameters

- **package** – string with the name of the accelerator package
- **category** – string with the category name of the setting
- **setting** – string with the name of the specific setting

Returns

1 if available, 0 if not.

int **lammops_has_gpu_device**()

Check for presence of a viable GPU package device

Added in version 14May2021.

The *lammops_has_gpu_device()* function checks at runtime if an accelerator device is present that can be used with the *GPU package*. If at least one suitable device is present the function will return 1, otherwise 0.

More detailed information about the available device or devices can be obtained by calling the *lammops_get_gpu_device_info()* function.

Returns

1 if viable device is available, 0 if not.

void **lammops_get_gpu_device_info**(char *buffer, int buf_size)

Get GPU package device information

Added in version 14May2021.

The `lammops_get_gpu_device_info()` function can be used to retrieve detailed information about any accelerator devices that are viable for use with the *GPU package*. It will produce a string that is equivalent to the output of the `nvc_get_device` or `ocl_get_device` or `hip_get_device` tools that are compiled alongside LAMMPS if the GPU package is enabled.

A suitable buffer for a C-style string has to be provided and its length. The assembled text will be truncated to not overflow this buffer. This string can be several kilobytes long, if multiple devices are present.

Parameters

- **buffer** – string buffer to copy the information to
 - **buf_size** – size of the provided string buffer
-

int **lammops_has_style**(void*, const char*, const char*)

Check if a specific style has been included in *LAMMPS*

This function checks if the LAMMPS library in use includes the specific *style* of a specific *category* provided as an argument. Valid categories are: *atom*, *integrate*, *minimize*, *pair*, *bond*, *angle*, *dihedral*, *improper*, *kpspace*, *compute*, *fix*, *region*, *dump*, and *command*.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *
- **category** – category of the style
- **name** – name of the style

Returns

1 if included, 0 if not.

int **lammops_style_count**(void*, const char*)

Count the number of styles of category in the *LAMMPS* library.

This function counts how many styles in the provided *category* are included in the LAMMPS library in use. Please see `lammops_has_style()` for a list of valid categories.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *
- **category** – category of styles

Returns

number of styles in category

```
int lammops_style_name(void*, const char*, int, char*, int)
```

Look up the name of a style by index in the list of style of a given category in the *LAMMPS* library.

This function copies the name of the *category* style with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **category** – category of styles
- **idx** – index of the style in the list of *category* styles (0 ≤ idx < style count)
- **buffer** – string buffer to copy the name of the style to
- **buf_size** – size of the provided string buffer

Returns

1 if successful, otherwise 0

```
int lammops_has_id(void*, const char*, const char*)
```

Check if a specific ID exists in the current *LAMMPS* instance

Added in version 9Oct2020.

This function checks if the current LAMMPS instance a *category* ID of the given *name* exists. Valid categories are: *compute*, *dump*, *fix*, *group*, *molecule*, *region*, and *variable*.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **category** – category of the id
- **name** – name of the id

Returns

1 if included, 0 if not.

```
int lammops_id_count(void*, const char*)
```

Count the number of IDs of a category.

Added in version 9Oct2020.

This function counts how many IDs in the provided *category* are defined in the current LAMMPS instance. Please see *lammops_has_id()* for a list of valid categories.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **category** – category of IDs

Returns

number of IDs in category

int **lammops_id_name**(void*, const char*, int, char*, int)

Look up the name of an ID by index in the list of IDs of a given category.

Added in version 9Oct2020.

This function copies the name of the *category* ID with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **category** – category of IDs
- **idx** – index of the ID in the list of *category* styles (0 <= idx < count)
- **buffer** – string buffer to copy the name of the style to
- **buf_size** – size of the provided string buffer

Returns

1 if successful, otherwise 0

1.1.9 Utility functions

To simplify some tasks, the library interface contains these utility functions. They do not directly call the LAMMPS library.

- *lammops_encode_image_flags()*
- *lammops_decode_image_flags()*
- *lammops_set_fix_external_callback()*
- *lammops_fix_external_get_force()*
- *lammops_fix_external_set_energy_global()*
- *lammops_fix_external_set_energy_peratom()*
- *lammops_fix_external_set_virial_global()*
- *lammops_fix_external_set_virial_peratom()*
- *lammops_fix_external_set_vector_length()*
- *lammops_fix_external_set_vector()*
- *lammops_flush_buffers()*
- *lammops_free()*
- *lammops_is_running()*
- *lammops_force_timeout()*
- *lammops_has_error()*

- `lammps_get_last_error_message()`
- `lammps_set_show_error()`
- `lammps_python_api_version()`

The `lammps_free()` function is a clean-up function to free memory that the library had allocated previously via other function calls. Look for notes in the descriptions of the individual commands where such memory buffers were allocated that require the use of `lammps_free()`.

int **lammps_encode_image_flags**(int ix, int iy, int iz)
Encode three integer image flags into a single imageint.

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```
int64_t lammps_encode_image_flags(int ix, int iy, int iz);
```

This function performs the bit-shift, addition, and bit-wise OR operations necessary to combine the values of three integers representing the image flags in x-, y-, and z-direction. Unless LAMMPS is compiled with `-DLAMMPS_BIGBIG`, those integers are limited 10-bit signed integers [-512, 511]. Otherwise the return type changes from `int` to `int64_t` and the valid range for the individual image flags becomes [-1048576, 1048575], i.e. that of a 21-bit signed integer. There is no check on whether the arguments conform to these requirements.

Parameters

- **ix** – image flag value in x
- **iy** – image flag value in y
- **iz** – image flag value in z

Returns

encoded image flag integer

void **lammps_decode_image_flags**(int image, int *flags)
Decode a single image flag integer into three regular integers

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```
void lammps_decode_image_flags(int64_t image, int *flags);
```

This function does the reverse operation of `lammps_encode_image_flags()` and takes an image flag integer does the bit-shift and bit-masking operations to decode it and stores the resulting three regular integers into the buffer pointed to by `flags`.

Parameters

- **image** – encoded image flag integer
 - **flags** – pointer to storage where the decoded image flags are stored.
-

void **lammops_set_fix_external_callback**(void *handle, const char *id, FixExternalFnPtr funcptr, void *ptr)

Set up the callback function for a fix external instance with the given ID.

Fix *external* allows programs that are running LAMMPS through its library interface to modify certain LAMMPS properties on specific timesteps, similar to the way other fixes do.

This function sets the callback function for use with the “pf/callback” mode. The function has to have C language bindings with the prototype:

```
void func(void *ptr, bigint timestep, int nlocal, tagint *ids, double **x, double_
→ **fexternal);
```

The argument *ptr* to this function will be stored in fix external and the passed as the first argument calling the callback function *func()*. This would usually be a pointer to the active LAMMPS instance, i.e. the same pointer as the *handle* argument. This would be needed to call functions that set the global or per-atom energy or virial contributions from within the callback function.

The callback mechanism is one of the two modes of how forces and can be applied to a simulation with the help of fix external. The alternative is the array mode where you call *lammops_fix_external_get_force()*.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Changed in version 28Jul2021.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **id** – fix ID of fix external instance
- **funcptr** – pointer to callback function
- **ptr** – pointer to object in calling code, passed to callback function as first argument

double ****lammops_fix_external_get_force**(void *handle, const char *id)

Get pointer to the force array storage in a fix external instance with the given ID.

Added in version 28Jul2021.

Fix *external* allows programs that are running LAMMPS through its library interface to add or modify certain LAMMPS properties on specific timesteps, similar to the way other fixes do.

This function provides access to the per-atom force storage in a fix external instance with the given fix-ID to be added to the individual atoms when using the “pf/array” mode. The *fexternal* array can be accessed like other “native” per-atom arrays accessible via the *lammops_extract_atom()* function. Please note that the array stores holds the forces for *local* atoms for each MPI ranks, in the order determined by the neighbor list build. Because the underlying data structures can change as well as the order of atom as they migrate between MPI processes because of the domain decomposition parallelization, this function should be always called immediately before the forces are going to be set to get an up-to-date pointer. You can use, for example, *lammops_extract_setting()* to obtain the number of local atoms *nlocal* and then assume the dimensions of the returned force array as double force[nlocal][3].

This is an alternative to the callback mechanism in fix external set up by *lammops_set_fix_external_callback()*. The main difference is that this mechanism can be used

when forces are pre-computed and the control alternates between LAMMPS and the external code, while the callback mechanism can call the external code to compute the force when the fix is triggered and needs them.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **id** – fix ID of fix external instance

Returns

a pointer to the per-atom force array allocated by the fix

void **lammops_fix_external_set_energy_global**(void *handle, const char *id, double eng)

Set the global energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to *lammops_set_fix_external_callback()* and *lammops_fix_external_get_force()* to also set the contribution to the global energy from the external code. The value of the *eng* argument will be stored in the fix and applied on the current and all following timesteps until changed by another call to this function. The energy is in energy units as determined by the current *units* settings and is the **total** energy of the contribution. Thus when running in parallel all MPI processes have to call this function with the **same** value and this will be returned as scalar property of the fix external instance when accessed in LAMMPS input commands or from variables.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
 - **id** – fix ID of fix external instance
 - **eng** – total energy to be added to the global energy
-

void **lammops_fix_external_set_energy_peratom**(void *handle, const char *id, double *eng)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to *lammops_set_fix_external_callback()* to set the per-atom energy contribution due to the fix from the external code as part of the callback function. For this to work, the handle to the LAMMPS object must be passed as the *ptr* argument when registering the callback function.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Note

This function is fully independent from `lammps_fix_external_set_energy_global()` and will **NOT** add any contributions to the global energy tally and **NOT** check whether the sum of the contributions added here are consistent with the global added energy.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to `void *`.
- **id** – fix ID of fix external instance
- **eng** – pointer to array of length `nlocal` with the energy to be added to the per-atom energy

```
void lammps_fix_external_set_virial_global(void *handle, const char *id, double *virial)
```

Set the global virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to `lammps_set_fix_external_callback()` and `lammps_fix_external_get_force()` to set the contribution to the global virial from the external code.

The 6 values of the *virial* array will be stored in the fix and applied on the current and all following timesteps until changed by another call to this function. The components of the virial need to be stored in the order: *xx*, *yy*, *zz*, *xy*, *xz*, *yz*. In LAMMPS the virial is stored internally as *stress*volume* in units of *pressure*volume* as determined by the current *units* settings and is the **total** contribution. Thus when running in parallel all MPI processes have to call this function with the **same** value and this will then be added by fix external.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to `void *`.
- **id** – fix ID of fix external instance
- **virial** – the 6 global stress tensor components to be added to the global virial

```
void lammps_fix_external_set_virial_peratom(void *handle, const char *id, double **virial)
```

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to `lammps_set_fix_external_callback()` to set the per-atom virial contribution due to the fix from the external code as part of the callback function. For this to work, the handle to the LAMMPS object must be passed as the *ptr* argument when registering the callback function.

The order and units of the per-atom stress tensor elements are the same as for the global virial. The code in fix external assumes the dimensions of the per-atom virial array is `double virial[nlocal][6]`.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Note

This function is fully independent from `lammps_fix_external_set_virial_global()` and will **NOT** add any contributions to the global virial tally and **NOT** check whether the sum of the contributions added here are consistent with the global added virial.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to `void *`.
- **id** – fix ID of fix external instance
- **virial** – a list of nlocal entries with the 6 per-atom stress tensor components to be added to the per-atom virial

void **lammps_fix_external_set_vector_length**(void *handle, const char *id, int len)

Set the vector length for a global vector stored with fix external for analysis

Added in version 28Jul2021.

This is a companion function to `lammps_set_fix_external_callback()` and `lammps_fix_external_get_force()` to set the length of a global vector of properties that will be stored with the fix via `lammps_fix_external_set_vector()`.

This function needs to be called **before** a call to `lammps_fix_external_set_vector()` and **before** a run or minimize command. When running in parallel it must be called from **all** MPI processes and with the same length parameter.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to `void *`.
- **id** – fix ID of fix external instance
- **len** – length of the global vector to be stored with the fix

void **lammps_fix_external_set_vector**(void *handle, const char *id, int idx, double val)

Store a global vector value for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to `lammps_set_fix_external_callback()` and `lammps_fix_external_get_force()` to set the values of a global vector of properties that will be stored with the fix. And can be accessed from within LAMMPS input commands (e.g., fix ave/time or variables) when used in a vector context.

This function needs to be called **after** a call to `lammps_fix_external_set_vector_length()` and the **before** a run or minimize command. When running in parallel it must be called from **all** MPI processes and with the **same** index and value parameters. The value is assumed to be extensive.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Note

The index in the *idx* parameter is 1-based, i.e. the first element is set with *idx* = 1 and the last element of the vector with *idx* = N, where N is the value of the *len* parameter of the call to *lammops_fix_external_set_vector_length()*.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to void *.
- **id** – fix ID of fix external instance
- **idx** – 1-based index of in global vector
- **val** – value to be stored in global vector

void **lammops_flush_buffers**(void *ptr)

Flush output buffers

This function can be used to flush buffered output to be written to screen and logfile pointers to simplify capturing output from LAMMPS library calls.

Parameters

handle – pointer to a previously created *LAMMPS* instance cast to void *.

void **lammops_free**(void *ptr)

Free memory buffer allocated by *LAMMPS*.

Some of the LAMMPS C library interface functions return data as pointer to a buffer that has been allocated by LAMMPS or the library interface. This function can be used to delete those in order to avoid memory leaks.

Parameters

ptr – pointer to data allocated by *LAMMPS*

int **lammops_is_running**(void *handle)

Check if *LAMMPS* is currently inside a run or minimization

This function can be used from signal handlers or multi-threaded applications to determine if the *LAMMPS* instance is currently active.

Parameters

handle – pointer to a previously created *LAMMPS* instance cast to void *.

Returns

0 if idle or >0 if active

void **lammops_force_timeout**(void *handle)

Force a timeout to stop an ongoing run cleanly.

This function can be used from signal handlers or multi-threaded applications to cleanly terminate an ongoing run.

Parameters

handle – pointer to a previously created *LAMMPS* instance cast to void *

int **lammops_has_error**(void *handle)

Check if there is a (new) error message available

This function can be used to query if an error inside of LAMMPS has thrown a *C++ exception*.

Note

Changed in version 2Aug2023.

The *handle* pointer may be NULL for this function, as would be the case when a call to create a LAMMPS instance has failed. Then this function will not check the error status inside the LAMMPS instance, but instead would check the global error buffer of the library interface.

Parameters

handle – pointer to a previously created *LAMMPS* instance cast to void * or NULL

Returns

0 on no error, 1 on error.

int **lammops_get_last_error_message**(void *handle, char *buffer, int buf_size)

Copy the last error message into the provided buffer

This function can be used to retrieve the error message that was set in the event of an error inside of LAMMPS which resulted in a *C++ exception*. A suitable buffer for a C-style string has to be provided and its length. If the internally stored error message is longer, it will be truncated accordingly. If the buffer is a NULL pointer, then nothing will be copied. The return value of the function corresponds to the kind of error: a “1” indicates an error that occurred on all MPI ranks and is often recoverable, while a “2” indicates an abort that would happen only in a single MPI rank and thus may not be recoverable, as other MPI ranks may be waiting on the failing MPI ranks to send messages.

Note

Changed in version 2Aug2023.

The *handle* pointer may be NULL for this function, as would be the case when a call to create a LAMMPS instance has failed. Then this function will not check the error buffer inside the LAMMPS instance, but instead would check the global error buffer of the library interface.

Changed in version 21Nov2023.

The *buffer* pointer may be NULL. This will clear any error status without copying the error message.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to `void *` or `NULL`.
- **buffer** – string buffer to copy the error message to, may be `NULL`
- **buf_size** – size of the provided string buffer

Returns

1 when all ranks had the error, 2 on a single rank error.

int **lammps_set_show_error**(void *handle, const int flag)

Enable or disable direct printing of error messages

Added in version 2Apr2025.

This function can be used to stop LAMMPS from printing error messages *before* LAMMPS throws a *C++ exception*. This is so it may be left to the code calling the library interface whether to check for them, and retrieve and print error messages using the library interface functions *lammps_has_error()* and *lammps_get_last_error_message()*. The function returns the previous setting so that one can easily override the setting temporarily and restore it afterwards.

Parameters

- **handle** – pointer to a previously created *LAMMPS* instance cast to `void *` or `NULL`
- **flag** – enable (not 0) or disable (0) printing error messages before throwing exception

Returns

previous setting of the flag

int **lammps_python_api_version**()

Return API version of embedded Python interpreter

Added in version 3Nov2022.

This function is used by the ML-IAP python code (mliappy) to verify the API version of the embedded python interpreter of the PYTHON package. It returns -1 if the PYTHON package is not enabled.

Returns

PYTHON_API_VERSION constant of the python interpreter or -1

1.1.10 Extending the C API

The functionality of the LAMMPS library interface has historically been motivated by the needs of its users. Functions have been added or expanded as they were needed and used. Contributions to the interface are always welcome. However with a refactoring of the library interface and its documentation that started in Spring 2020, there are now a few requirements for including new changes or extensions.

- New functions should be orthogonal to existing ones and not implement functionality that can already be achieved with the existing APIs.
- All changes and additions should be documented with *Doxygen* style comments and references to those functions added to the corresponding files in the `doc/src` folder.
- If possible, new unit tests to test those new features should be added.

- New features should also be implemented and documented not just for the C interface, but also the Python and Fortran interfaces.
- All additions should work and be compatible with `-DLAMMPS_BIGBIG`, `-DLAMMPS_SMALLBIG` as well as when compiling with and without MPI support.
- The `library.h` file should be kept compatible to C code at a level similar to C89. Its interfaces may not reference any custom data types (e.g. `bigint`, `tagint`, and so on) that are only known inside of LAMMPS; instead `int` and `int64_t` should be used.
- only use C style comments, not C++ style

Please note that these are not **strict** requirements, but the LAMMPS developers very much appreciate, if they are followed and can assist with implementing what is missing. It helps maintaining the code base and keeping it consistent.

1.2 LAMMPS Python API

The LAMMPS Python module enables calling the LAMMPS C library API from Python by dynamically loading functions in the LAMMPS shared library through the [Python ctypes module](#). Because of the dynamic loading, it is **required** that LAMMPS is compiled in “*shared*” mode. The Python interface is object-oriented, but otherwise tries to be very similar to the C library API. More information on this is in the [Use Python with LAMMPS](#) section of the manual. Use of the LAMMPS Python module is described in [The lammps Python module](#).

1.3 LAMMPS Fortran API

The LAMMPS Fortran module is a wrapper around calling functions from the LAMMPS C library API. This is done using the `ISO_C_BINDING` feature in Fortran 2003. The interface is object-oriented but otherwise tries to be very similar to the C library API and the basic Python module.

1.3.1 The *LIBLAMMPS* Fortran Module

The *LIBLAMMPS* module provides an interface to call LAMMPS from Fortran. It is based on the LAMMPS C library interface and requires a fully Fortran 2003-compatible compiler to be compiled. It is designed to be self-contained and not require any support functions written in C, C++, or Fortran other than those in the C library interface and the LAMMPS Fortran module itself.

While C libraries have a defined binary interface (ABI) and can thus be used from multiple compiler versions from different vendors as long as they are compatible with the hosting operating system, the same is not true for Fortran programs. Thus, the LAMMPS Fortran module needs to be compiled alongside the code using it from the source code in `fortran/lammps.f90` and with the same compiler used to build the rest of the Fortran code that interfaces to LAMMPS. When linking, you also need to [link to the LAMMPS library](#). A typical command for a simple program using the Fortran interface would be:

```
mpifort -o testlib.x lammps.f90 testlib.f90 -L. -llammps
```

Please note that the MPI compiler wrapper is only required when the calling the library *from* an MPI-parallelized program. Otherwise, using the plain Fortran compiler (gfortran, ifort, flang, etc.) will suffice, since there are no direct references to MPI library features, definitions and subroutine calls; MPI communicators are referred to by their integer index representation as required by the Fortran MPI interface. It may be necessary to link to additional libraries, depending on how LAMMPS was configured and whether the LAMMPS library *was compiled as a static or dynamic library*.

If the LAMMPS library itself has been compiled with MPI support, the resulting executable will be able to run LAMMPS in parallel with `mpirun`, `mpiexec`, or equivalent. This may be either on the “world” communicator or a sub-communicator created by the calling Fortran code. If, on the other hand, the LAMMPS library has been compiled **without** MPI support, each LAMMPS instance will run independently using just one processor.

Please also note that the order of the source files matters: the `lammps.f90` file needs to be compiled first, since it provides the `LIBLAMMPS` module that would need to be imported by the calling Fortran code in order to use the Fortran interface. A working example can be found together with equivalent examples in C and C++ in the `examples/COUPLE/simple` folder of the LAMMPS distribution.

i Fortran compiler compatibility

A fully Fortran 2003 compatible Fortran compiler is required. This means that currently only GNU Fortran 9 and later are compatible and thus the default compilers of Red Hat or CentOS 7 and Ubuntu 18.04 LTS and not compatible. Either newer compilers need to be installed or the Linux updated.

1.3.2 Creating or deleting a LAMMPS object

With the Fortran interface, the creation of a `LAMMPS` instance is included in the constructor for creating the `lammps()` derived type. To import the definition of that type and its type-bound procedures, you need to add a `USE LIBLAMMPS` statement. Internally, it will call either `lammps_open_fortran()` or `lammps_open_no_mpi()` from the C library API to create the class instance. All arguments are optional and `lammps_mpi_init()` will be called automatically if it is needed. Similarly, optional calls to `lammps_mpi_finalize()`, `lammps_kokkos_finalize()`, `lammps_python_finalize()`, and `lammps_plugin_finalize()` are integrated into the `close()` function and triggered with the optional logical argument set to `.TRUE.`. Here is a simple example:

```
PROGRAM testlib
  USE LIBLAMMPS                      ! include the LAMMPS library interface
  IMPLICIT NONE
  TYPE(lammps) :: lmp                ! derived type to hold LAMMPS instance
  CHARACTER(LEN=12), PARAMETER :: args(3) = &
    [ CHARACTER(LEN=12) :: 'liblammps', '-log', 'none' ]

  ! create a LAMMPS instance (and initialize MPI)
  lmp = lammps(args)
  ! get and print numerical version code
  PRINT*, 'LAMMPS Version: ', lmp%version()
  ! delete LAMMPS instance (and shutdown MPI)
  CALL lmp%close(.TRUE.)
END PROGRAM testlib
```

It is also possible to pass command-line flags from Fortran to C/C++ and thus make the resulting executable behave similarly to the standalone executable (it will ignore the `-in/-i` flag, though). This allows using the command-line to configure accelerator and suffix settings, configure screen and logfile output, or to set index style variables from the command-line and more. Here is a correspondingly adapted version of the previous example:

```
PROGRAM testlib2
  USE LIBLAMMPS                      ! include the LAMMPS library interface
  IMPLICIT NONE
  TYPE(lammps) :: lmp                ! derived type to hold LAMMPS instance
  CHARACTER(LEN=128), ALLOCATABLE :: command_args(:)
```

(continues on next page)

(continued from previous page)

```

INTEGER :: i, argc

! copy command-line flags to `command_args()`
argc = COMMAND_ARGUMENT_COUNT()
ALLOCATE(command_args(0:argc))
DO i=0, argc
  CALL GET_COMMAND_ARGUMENT(i, command_args(i))
END DO

! create a LAMMPS instance (and initialize MPI)
lmp = lammps(command_args)
! get and print numerical version code
PRINT*, 'Program name: ', command_args(0)
PRINT*, 'LAMMPS Version: ', lmp%version()
! delete LAMMPS instance (and shuts down MPI)
CALL lmp%close(.TRUE.)
DEALLOCATE(command_args)
END PROGRAM testlib2

```

1.3.3 Executing LAMMPS commands

Once a LAMMPS instance is created, it is possible to “drive” the LAMMPS simulation by telling LAMMPS to read commands from a file or to pass individual or multiple commands from strings or lists of strings. This is done similarly to how it is implemented in the *C library interface*. Before handing off the calls to the C library interface, the corresponding Fortran versions of the calls (*file()*, *command()*, *commands_list()*, and *commands_string()*) have to make copies of the strings passed as arguments so that they can be modified to be compatible with the requirements of strings in C without affecting the original strings. Those copies are automatically deleted after the functions return. Below is a small demonstration of the uses of the different functions.

```

PROGRAM testcmd
USE LIBLAMMPS
TYPE(lammps) :: lmp
CHARACTER(LEN=512) :: cmds
CHARACTER(LEN=40), ALLOCATABLE :: cmdlist(:)
CHARACTER(LEN=10) :: trimmed
INTEGER :: i

lmp = lammps()
CALL lmp%file('in.melt')
CALL lmp%command('variable zpos index 1.0')
! define 10 groups of 10 atoms each
ALLOCATE(cmdlist(10))
DO i=1, 10
  WRITE(trimmed, '(I10)') 10*i
  WRITE(cmdlist(i), '(A,I1,A,I10,A,A)')      &
    'group g', i-1, ' id ', 10*(i-1)+1, ':', ADJUSTL(trimmed)
END DO
CALL lmp%commands_list(cmdlist)
! run multiple commands from multi-line string
cmds = 'clear' // NEW_LINE('A') //
&

```

(continues on next page)

(continued from previous page)

```

'region box block 0 2 0 2 0 2' // NEW_LINE('A') // &
'create_box 1 box' // NEW_LINE('A') // &
'create_atoms 1 single 1.0 1.0 ${zpos}'
CALL lmp%commands_string(cmds)
CALL lmp%close(.TRUE.)
END PROGRAM testcmd

```

1.3.4 Accessing system properties

The C library interface allows the *extraction of different kinds of information* about the active simulation instance and also—in some cases—to apply modifications to it, and the Fortran interface provides access to the same data using Fortran-style, C-interoperable data types. In some cases, the Fortran library interface makes pointers to internal LAMMPS data structures accessible; when accessing them through the library interfaces, special care is needed to avoid data corruption and crashes. Please see the documentation of the individual type-bound procedures for details.

Below is an example demonstrating some of the possible uses.

```

PROGRAM testprop
  USE LIBLAMMPS
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_double, c_int64_t, c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  TYPE(lammps) :: lmp
  INTEGER(KIND=c_int64_t), POINTER :: natoms, ntimestep, bval
  REAL(KIND=c_double), POINTER :: dt, dval
  INTEGER(KIND=c_int), POINTER :: nfield, typ, ival
  INTEGER(KIND=c_int) :: i
  CHARACTER(LEN=11) :: key
  REAL(KIND=c_double) :: pe, ke

  lmp = lammps()
  CALL lmp%file('in.sysinit')
  natoms = lmp%extract_global('natoms')
  WRITE(OUTPUT_UNIT,'(A,I0,A)') 'Running a simulation with ', natoms, ' atoms'
  WRITE(OUTPUT_UNIT,'(I0,A,I0,A,I0,A)') lmp%extract_setting('nlocal'), &
    ' local and ', lmp%extract_setting('nghost'), ' ghost atoms. ', &
    lmp%extract_setting('ntypes'), ' atom types'

  CALL lmp%command('run 2 post no')

  ntimestep = lmp%last_thermo('step', 0)
  nfield = lmp%last_thermo('num', 0)
  WRITE(OUTPUT_UNIT,'(A,I0,A,I0)') 'Last thermo output on step: ', ntimestep, &
    ', number of fields: ', nfield
  DO i=1, nfield
    key = lmp%last_thermo('keyword',i)
    typ = lmp%last_thermo('type',i)
    IF (typ == lmp%dtype%i32) THEN
      ival = lmp%last_thermo('data',i)
      WRITE(OUTPUT_UNIT,*) key, ': ', ival
    ELSE IF (typ == lmp%dtype%i64) THEN
      bval = lmp%last_thermo('data',i)

```

(continues on next page)

(continued from previous page)

```

        WRITE(OUTPUT_UNIT,*) key, ': ', bval
    ELSE IF (typ == lmp%dtype%r64) THEN
        dval = lmp%last_thermo('data',i)
        WRITE(OUTPUT_UNIT,*) key, ': ', dval
    END IF
END DO

dt = lmp%extract_global('dt')
ntimestep = lmp%extract_global('ntimestep')
WRITE(OUTPUT_UNIT,'(A,I0,A,F4.1,A)') 'At step: ', ntimestep, &
'    Changing timestep from', dt, ' to 0.5'
dt = 0.5_c_double
CALL lmp%command('run 2 post no')

WRITE(OUTPUT_UNIT,'(A,I0)') 'At step: ', ntimestep
pe = lmp%get_thermo('pe')
ke = lmp%get_thermo('ke')
WRITE(OUTPUT_UNIT,*) 'PE = ', pe
WRITE(OUTPUT_UNIT,*) 'KE = ', ke

CALL lmp%close(.TRUE.)
END PROGRAM testprop

```

1.3.5 The *LIBLAMMPS* module API

Below are the detailed descriptions of definitions and interfaces of the contents of the *LIBLAMMPS* Fortran interface to LAMMPS.

type lammps

Derived type that is the general class of the Fortran interface. It holds a reference to the *LAMMPS* class instance to which any of the included calls are forwarded.

Type fields

- % **handle** [*c_ptr*] :: reference to the LAMMPS class
- % **style** [*type(lammps_style)*] :: derived type to access lammps style constants
- % **type** [*type(lammps_type)*] :: derived type to access lammps type constants
- % **dtype** [*type(lammps_dtype)*] :: derived type to access lammps data type constants
- % **close** [*subroutine*] :: *close()*
- % **error** [*subroutine*] :: *error()*
- % **file** [*subroutine*] :: *file()*
- % **command** [*subroutine*] :: *command()*
- % **commands_list** [*subroutine*] :: *commands_list()*
- % **commands_string** [*subroutine*] :: *commands_string()*
- % **get_natoms** [*function*] :: *get_natoms()*
- % **get_thermo** [*function*] :: *get_thermo()*

- % **last_thermo** [*function*] :: **last_thermo**()
- % **extract_box** [*subroutine*] :: **extract_box**()
- % **reset_box** [*subroutine*] :: **reset_box**()
- % **memory_usage** [*subroutine*] :: **memory_usage**()
- % **get_mpi_comm** [*function*] :: **get_mpi_comm**()
- % **extract_setting** [*function*] :: **extract_setting**()
- % **extract_global** [*function*] :: **extract_global**()

function `lammps`(*[args]*,*[comm]*)

This is the constructor for the Fortran class and will forward the arguments to a call to either `lammps_open_fortran()` or `lammps_open_no_mpi()`. If the LAMMPS library has been compiled with MPI support, it will also initialize MPI, if it has not already been initialized before.

The *args* argument with the list of command-line parameters is optional and so is the *comm* argument with the MPI communicator. If *comm* is not provided, `MPI_COMM_WORLD` is assumed. For more details please see the documentation of `lammps_open()`.

Options

- `args` *[character(len=*),dimension(:),optional]* :: arguments as list of strings
- `comm` *[integer,optional]* :: MPI communicator

Call to

`lammps_open_fortran()` `lammps_open_no_mpi()`

Return

`lammps` :: an instance of the `lammps` derived type

Note

The `MPI_F08` module, which defines Fortran 2008 bindings for MPI, is not directly supported by this interface due to the complexities of supporting both the `MPI_F08` and `MPI` modules at the same time. However, you should be able to use the `MPI_VAL` member of the `MPI_comm` derived type to access the integer value of the communicator, such as in

```
PROGRAM testmpi
  USE LIBLAMMPS
  USE MPI_F08
  TYPE(lammps) :: lmp
  lmp = lammps(comm=MPI_COMM_SELF%MPI_VAL)
END PROGRAM testmpi
```

type `lammps_style`

This derived type is there to provide a convenient interface for the style constants used with `extract_compute()`, `extract_fix()`, and `extract_variable()`. Assuming your LAMMPS instance is called `lmp`, these constants will be `lmp%style%global`, `lmp%style%atom`, and `lmp%style%local`. These values are identical to the values described in `_LMP_STYLE_CONST` for the C library interface.

Type fields

- **% global** [*integer(c_int)*] :: used to request global data
- **% atom** [*integer(c_int)*] :: used to request per-atom data
- **% local** [*integer(c_int)*] :: used to request local data

type lammps_type

This derived type is there to provide a convenient interface for the type constants used with [extract_compute\(\)](#), [extract_fix\(\)](#), and [extract_variable\(\)](#). Assuming your LAMMPS instance is called `lmp`, these constants will be `lmp%type%scalar`, `lmp%type%vector`, and `lmp%type%array`. These values are identical to the values described in [_LMP_TYPE_CONST](#) for the C library interface.

Type fields

- **% scalar** [*integer(c_int)*] :: used to request scalars
- **% vector** [*integer(c_int)*] :: used to request vectors
- **% array** [*integer(c_int)*] :: used to request arrays (matrices)

Procedures Bound to the lammps Derived Type**subroutine close**(*[finalize]*)

This method will close down the LAMMPS instance through calling [lammps_close\(\)](#). If the *finalize* argument is present and has a value of `.TRUE.`, then this subroutine also calls [lammps_kokkos_finalize\(\)](#), [lammps_mpi_finalize\(\)](#), [lammps_python_finalize\(\)](#), and [lammps_plugin_finalize\(\)](#).

Options

finalize [*logical,optional*] :: shut down the MPI environment of the LAMMPS library if `.TRUE.`.

Call to

```
lammps_close()      lammps_mpi_finalize()      lammps_kokkos_finalize()
lammps_python_finalize() lammps_plugin_finalize()
```

subroutine error(*error_type, error_text*)

This method is a wrapper around the [lammps_error\(\)](#) function and will dispatch an error through the LAMMPS Error class.

Added in version 3Nov2022.

Parameters

- **error_type** [*integer(c_int)*] :: constant to select which Error class function to call
- **error_text** [*character(len=*)*] :: error message

Call to

```
lammps_error()
```

subroutine file(*filename*)

This method will call [lammps_file\(\)](#) to have LAMMPS read and process commands from a file.

Parameters

filename [*character(len=*)*] :: name of file with LAMMPS commands

Call to

```
lammps_file()
```

subroutine command(cmd)

This method will call [lammmps_command\(\)](#) to have LAMMPS execute a single command.

Parameters

cmd [*character(len=*)*] :: single LAMMPS command

Call to

[lammmps_command\(\)](#)

subroutine commands_list(cmds)

This method will call [lammmps_commands_list\(\)](#) to have LAMMPS execute a list of input lines.

Parameters

cmd [*character(len=*),dimension(:)*] :: list of LAMMPS input lines

Call to

[lammmps_commands_list\(\)](#)

subroutine commands_string(str)

This method will call [lammmps_commands_string\(\)](#) to have LAMMPS execute a block of commands from a string.

Parameters

str [*character(len=*)*] :: LAMMPS input in string

Call to

[lammmps_commands_string\(\)](#)

function get_natoms()

This function will call [lammmps_get_natoms\(\)](#) and return the number of atoms in the system.

Call to

[lammmps_get_natoms\(\)](#)

Return

natoms [*real(c_double)*] :: number of atoms

Note

If you would prefer to get the number of atoms in its native format (i.e., as a 32- or 64-bit integer, depending on how LAMMPS was compiled), this can be extracted with [extract_global\(\)](#).

function get_thermo(name)

This function will call [lammmps_get_thermo\(\)](#) and return the value of the corresponding thermodynamic keyword.

Added in version 3Nov2022.

Parameters

name [*character(len=*)*] :: string with the name of the thermo keyword

Call to

`lammops_get_thermo()`

Return

value [*real(c_double)*] :: value of the requested thermo property or *0.0_c_double*

function `last_thermo(what, index)`

This function will call `lammops_last_thermo()` and returns either a string or a pointer to a cached copy of LAMMPS last thermodynamic output, depending on the data requested through *what*. Note that *index* uses 1-based indexing to access thermo output columns.

Added in version 15Jun2023.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data (with the exception of string data, which are copied and returned as ordinary Fortran strings). Pointers must be of the correct data type to point to said data (typically `INTEGER(c_int)`, `INTEGER(c_int64_t)`, or `REAL(c_double)`). The pointer being associated with LAMMPS data is type-checked at run-time via an overloaded assignment operator. The pointers returned by this function point to temporary, read-only data that may be overwritten at any time, so their target values need to be copied to local storage if they are supposed to persist.

For example,

```
PROGRAM thermo
  USE LIBLAMMPS
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_double, c_int64_t, c_int
  TYPE(lammops) :: lmp
  INTEGER(KIND=c_int64_t), POINTER :: n timestep, bval
  REAL(KIND=c_double), POINTER :: dval
  INTEGER(KIND=c_int), POINTER :: nfield, typ, ival
  INTEGER(KIND=c_int) :: i
  CHARACTER(LEN=11) :: key

  lmp = lammops()
  CALL lmp%file('in.sysinit')

  n timestep = lmp%last_thermo('step', 0)
  nfield = lmp%last_thermo('num', 0)
  PRINT*, 'Last thermo output on step: ', n timestep, ' Number of fields: ', nfield
  DO i=1, nfield
    key = lmp%last_thermo('keyword',i)
    typ = lmp%last_thermo('type',i)
    IF (typ == lmp%dtype%i32) THEN
      ival = lmp%last_thermo('data',i)
      PRINT*, key, ': ', ival
    ELSE IF (typ == lmp%dtype%i64) THEN
      bval = lmp%last_thermo('data',i)
      PRINT*, key, ': ', bval
    ELSE IF (typ == lmp%dtype%r64) THEN
      dval = lmp%last_thermo('data',i)
      PRINT*, key, ': ', dval
    END IF
  END DO
  CALL lmp%close(.TRUE.)
END PROGRAM thermo
```

would extract the last timestep where thermo output was done and the number of columns it printed. Then it loops over the columns to print out column header keywords and the corresponding data.

Note

If `last_thermo()` returns a string, the string must have a length greater than or equal to the length of the string (not including the terminal NULL character) that LAMMPS returns. If the variable's length is too short, the string will be truncated. As usual in Fortran, strings are padded with spaces at the end. If you use an allocatable string, the string **must be allocated** prior to calling this function.

Parameters

- **what** [*character(len=*)*] :: string with the name of the thermo keyword
- **index** [*integer(c_int)*] :: 1-based column index

Call to

`lammps_last_thermo()`

Return

pointer [*polymorphic*] :: pointer to LAMMPS data. The left-hand side of the assignment should be either a string (if expecting string data) or a C-compatible pointer (e.g., `INTEGER(c_int)`, `POINTER :: nlocal`) to the extracted property.

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures, crashes, or bogus simulations. In general, it is much better to use a LAMMPS input command that sets or changes these parameters. Using an input command will take care of all side effects and necessary updates of settings derived from such settings.

subroutine `extract_box`(*boxlo*[], *boxhi*[], *xy*[], *yz*[], *xz*[], *pflags*[], *boxflag*)

This subroutine will call `lammps_extract_box()`. All parameters are optional, though obviously at least one should be present. The parameters *pflags* and *boxflag* are stored in LAMMPS as integers, but should be declared as LOGICAL variables when calling from Fortran.

Added in version 3Nov2022.

Options

- **boxlo** [*real(c_double),dimension(3),optional*] :: vector in which to store lower-bounds of simulation box
- **boxhi** [*real(c_double),dimension(3),optional*] :: vector in which to store upper-bounds of simulation box
- **xy** [*real(c_double),optional*] :: variable in which to store xy tilt factor
- **yz** [*real(c_double),optional*] :: variable in which to store yz tilt factor
- **xz** [*real(c_double),optional*] :: variable in which to store xz tilt factor
- **pflags** [*logical,dimension(3),optional*] :: vector in which to store periodicity flags (. TRUE . means periodic in that dimension)

- **boxflag** [*logical,optional*] :: variable in which to store boolean denoting whether the box will change during a simulation (.TRUE. means box will change)

Call to

lammps_extract_box()

i Note

Note that a frequent use case of this function is to extract only one or more of the options rather than all seven. For example, assuming “*lmp*” represents a properly-initialized LAMMPS instance, the following code will extract the periodic box settings into the variable “*periodic*”:

```
! code to start up
LOGICAL :: periodic(3)
! code to initialize LAMMPS / run things / etc.
CALL lmp%extract_box(pflags = periodic)
```

subroutine reset_box(*boxlo, boxhi, xy, yz, xz*)

This subroutine will call *lammps_reset_box()*. All parameters are required.

Added in version 3Nov2022.

Parameters

- **boxlo** [*real(c_double),dimension(3)*] :: vector of three doubles containing the lower box boundary
- **boxhi** [*real(c_double),dimension(3)*] :: vector of three doubles containing the upper box boundary
- **xy** [*real(c_double)*] :: *x*-*y* tilt factor
- **yz** [*real(c_double)*] :: *y*-*z* tilt factor
- **xz** [*real(c_double)*] :: *x*-*z* tilt factor

Call to

lammps_reset_box()

subroutine memory_usage(*meminfo*)

This subroutine will call *lammps_memory_usage()* and store the result in the three-element array *meminfo*.

Added in version 3Nov2022.

Parameters

meminfo [*real(c_double),dimension(3)*] :: vector of three doubles in which to store memory usage data

Call to

lammps_memory_usage()

function `get_mpi_comm()`

This function returns a Fortran representation of the LAMMPS “world” communicator.

Added in version 3Nov2022.

Call to

`lammps_get_mpi_comm()`

Return

`comm [integer]` :: Fortran integer equivalent to the MPI communicator LAMMPS is using

Note

The C library interface currently returns type `int` instead of type `MPI_Fint`, which is the C type corresponding to Fortran `INTEGER` types of the default kind. On most compilers, these are the same anyway, but this interface exchanges values this way to avoid warning messages.

Note

The `MPI_F08` module, which defines Fortran 2008 bindings for MPI, is not directly supported by this function. However, you should be able to convert between the two using the `MPI_VAL` member of the communicator. For example,

```
USE MPI_F08
USE LIBLAMMPS
TYPE(lammps) :: lmp
TYPE(MPI_Comm) :: comm
! ... [commands to set up LAMMPS/etc.]
comm%MPI_VAL = lmp%get_mpi_comm()
```

should assign an `MPI_F08` communicator properly.

function `extract_setting(keyword)`

Query LAMMPS about global settings. See the documentation for the `lammps_extract_setting()` function from the C library.

Added in version 3Nov2022.

Parameters

`keyword [character(len=*)]` :: string containing the name of the thermo keyword

Call to

`lammps_extract_setting()`

Return

`setting [integer(c_int)]` :: value of the queried setting or `-1` if unknown

function `extract_global(name)`

This function calls `lammps_extract_global()` and returns either a string or a pointer to internal global LAMMPS data, depending on the data requested through `name`.

Added in version 3Nov2022.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data (with the exception of string data, which are copied and returned as ordinary Fortran strings). Pointers must be of the correct data type to point to said data (typically `INTEGER(c_int)`, `INTEGER(c_int64_t)`, or `REAL(c_double)`) and have compatible kind and rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator. The pointers returned by this function are generally persistent; therefore it is not necessary to call the function again unless a *clear command* command has been issued, which wipes out and recreates the contents of the `LAMMPS` class.

For example,

```
PROGRAM demo
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int64_t, c_int, c_double
  USE LIBLAMMPS
  TYPE(lammps) :: lmp
  INTEGER(c_int), POINTER :: nlocal => NULL()
  INTEGER(c_int64_t), POINTER :: ntimestep => NULL()
  REAL(c_double), POINTER :: dt => NULL()
  CHARACTER(LEN=10) :: units
  lmp = lammps()
  ! other commands
  nlocal = lmp%extract_global('nlocal')
  ntimestep = lmp%extract_global('ntimestep')
  dt = lmp%extract_global('dt')
  units = lmp%extract_global('units')
  ! more commands
  lmp.close(.TRUE.)
END PROGRAM demo
```

would extract the number of atoms on this processor, the current time step, the size of the current time step, and the units being used into the variables `nlocal`, `ntimestep`, `dt`, and `units`, respectively.

Note

If `extract_global()` returns a string, the string must have a length greater than or equal to the length of the string (not including the terminal NULL character) that LAMMPS returns. If the variable's length is too short, the string will be truncated. As usual in Fortran, strings are padded with spaces at the end. If you use an allocatable string, the string **must be allocated** prior to calling this function, but you can automatically reallocate it to the correct length after the function returns, viz.,

```
PROGRAM test
  USE LIBLAMMPS
  TYPE(lammps) :: lmp
  CHARACTER(LEN=:), ALLOCATABLE :: str
  lmp = lammps()
  CALL lmp%command('units metal')
  ALLOCATE(CHARACTER(LEN=80) :: str)
  str = lmp%extract_global('units')
  str = TRIM(str) ! re-allocates to length len_trim(str) here
  PRINT*, LEN(str), LEN_TRIM(str)
END PROGRAM test
```

will print the number 5 (the length of the word “metal”) twice.

Parameters

name [*character(len=*)*] :: string with the name of the property to extract

Call to

`lammps_extract_global()`

Return

pointer [*polymorphic*] :: pointer to LAMMPS data. The left-hand side of the assignment should be either a string (if expecting string data) or a C-compatible pointer (e.g., `INTEGER(c_int)`, `POINTER :: nlocal`) to the extracted property. If expecting vector data, the pointer should have dimension “:”.

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures, crashes, or bogus simulations. In general, it is much better to use a LAMMPS input command that sets or changes these parameters. Using an input command will take care of all side effects and necessary updates of settings derived from such settings.

function extract_atom(name)

This function calls `lammps_extract_atom()` and returns a pointer to LAMMPS data tied to the `Atom` class, depending on the data requested through *name*.

Added in version 3Nov2022.

Note that this function actually does not return a pointer, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct type, kind, and rank (e.g., `INTEGER(c_int)`, `DIMENSION(:)` for “type”, “mask”, or “id”; `INTEGER(c_int64_t)`, `DIMENSION(:)` for “id” if LAMMPS was compiled with the `-DLAMMPS_BIGBIG` flag; `REAL(c_double)`, `DIMENSION(:, :)` for “x”, “v”, or “f”; and so forth). The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time.

Parameters

name [*character(len=*)*] :: string with the name of the property to extract

Call to

`lammps_extract_atom()`

Return

pointer [*polymorphic*] :: pointer to LAMMPS data. The left-hand side of the assignment should be a C-interoperable pointer of appropriate kind and rank (e.g., `INTEGER(c_int)`, `POINTER :: mask(:)`) to the extracted property. If expecting vector data, the pointer should have dimension “:”; if expecting matrix data, the pointer should have dimension “,:”.

Warning

Pointers returned by this function are generally not persistent, as per-atom data may be redistributed, reallocated, and reordered at every re-neighboring operation. It is advisable to re-bind pointers using `extract_atom()` between runs.

i Array index order

Two-dimensional arrays returned from `extract_atom()` will be **transposed** from equivalent arrays in C, and they will be indexed from 1 instead of 0. For example, in C,

```
void *lmp;
double **x;
/* more code to setup, etc. */
x = lammps_extract_atom(lmp, "x");
printf("%f\n", x[5][1]);
```

will print the y-coordinate of the sixth atom on this processor. Conversely,

```
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:, :), POINTER :: x => NULL()
! more code to setup, etc.
x = lmp%extract_atom("x")
PRINT '(f0.6)', x(2,6)
```

will print the y-coordinate of the sixth atom on this processor (note the transposition of the two indices). This is not a choice, but rather a consequence of the different conventions adopted by the Fortran and C standards decades ago: in C, the block of data

```
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16
```

interpreted as a 4×4 matrix would be

$$\begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \\ 13 & 14 & 15 & 16 \end{bmatrix},$$

that is, in row-major order. In Fortran, the same block of data is interpreted in column-major order, namely,

$$\begin{bmatrix} 1 & 5 & 9 & 13 \\ 2 & 6 & 10 & 14 \\ 3 & 7 & 11 & 15 \\ 4 & 8 & 12 & 16 \end{bmatrix}.$$

This difference in interpretation of the same block of data by the two languages means, in effect, that matrices from C or C++ will be transposed when interpreted in Fortran.

i Note

If you would like the indices to start at 0 instead of 1 (which follows typical notation in C and C++, but not Fortran), you can create another pointer and associate it thus:

```
REAL(c_double), DIMENSION(:, :), POINTER :: x, x0
x = lmp%extract_atom("x")
x0(0:,0:) => x
```

The above would cause the dimensions of `x` to be (1:3, 1:nmax) and those of `x0` to be (0:2, 0:nmax-1).

function `extract_compute`(*id*, *style*, *type*)

This function calls `lammmps_extract_compute()` and returns a pointer to LAMMPS data tied to the Compute class, specifically data provided by the compute identified by *id*. Computes may provide global, per-atom, or local data, and those data may be a scalar, a vector, or an array. Since computes may provide multiple kinds of data, the user is required to specify which set of data is to be returned through the *style* and *type* variables.

Added in version 3Nov2022.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct data type to point to said data (i.e., `REAL(c_double)`) and have compatible rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator.

For example,

```
TYPE(lammmps) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: COM
! code to setup, create atoms, etc.
CALL lmp%command('compute COM all com')
COM = lmp%extract_compute('COM', lmp%style%global, lmp%style%type)
```

will bind the variable `COM` to the center of mass of the atoms created in your simulation. The vector in this case has length 3; the length (or, in the case of array data, the number of rows and columns) is determined for you based on data from the Compute class.

Array index order

Two-dimensional arrays returned from `extract_compute()` will be **transposed** from equivalent arrays in C, and they will be indexed from 1 instead of 0. See the note at `extract_atom()` for further details.

The following combinations are possible (assuming `lmp` is the name of your LAMMPS instance):

Style	Type	Type to assign to	Returned data
<code>lmp%style%global</code>	<code>lmp%type%scalar</code>	<code>REAL(c_double)</code> , <code>POINTER</code>	Global scalar
<code>lmp%style%global</code>	<code>lmp%type%vector</code>	<code>REAL(c_double)</code> , <code>DIMENSION(:)</code> , <code>POINTER</code>	Global vector
<code>lmp%style%global</code>	<code>lmp%type%array</code>	<code>REAL(c_double)</code> , <code>DIMENSION(:, :)</code> , <code>POINTER</code>	Global array
<code>lmp%style%atom</code>	<code>lmp%type%vector</code>	<code>REAL(c_double)</code> , <code>DIMENSION(:)</code> , <code>POINTER</code>	Per-atom vector
<code>lmp%style%atom</code>	<code>lmp%type%array</code>	<code>REAL(c_double)</code> , <code>DIMENSION(:, :)</code> , <code>POINTER</code>	Per-atom array
<code>lmp%style%local</code>	<code>lmp%type%vector</code>	<code>REAL(c_double)</code> , <code>DIMENSION(:)</code> , <code>POINTER</code>	Local vector
<code>lmp%style%local</code>	<code>lmp%type%array</code>	<code>REAL(c_double)</code> , <code>DIMENSION(:, :)</code> , <code>POINTER</code>	Local array

Parameters

- **id** [*character(len=*)*] :: compute ID from which to extract data
- **style** [*integer(c_int)*] :: value indicating the style of data to extract (global, per-atom, or local)
- **type** [*integer(c_int)*] :: value indicating the type of data to extract (scalar, vector, or array)

Call to`lammmps_extract_compute()`**Return**

pointer [*polymorphic*] :: pointer to LAMMPS data. The left-hand side of the assignment should be a C-compatible pointer (e.g., `REAL(c_double)`, `POINTER :: x`) to the extracted property. If expecting vector data, the pointer should have dimension “:”; if expecting array (matrix) data, the pointer should have dimension “:,:”.

Note

If the compute’s data are not already computed for the current step, the compute will be invoked. LAMMPS cannot easily check at that time if it is valid to invoke a compute, so it may fail with an error. The caller has to check to avoid such an error.

Warning

The pointers returned by this function are generally not persistent, since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation. It is advisable to re-invoke this function before the data are accessed or make a copy if the data are to be used after other LAMMPS commands have been issued. Do **not** modify the data returned by this function.

function `extract_fix(id, style, type[, nrow][, ncol])`

This function calls `lammmps_extract_fix()` and returns a pointer to LAMMPS data tied to the `Fix` class, specifically data provided by the fix identified by `id`. Fixes may provide global, per-atom, or local data, and those data may be a scalar, a vector, or an array. Since many fixes provide multiple kinds of data, the user is required to specify which set of data is to be returned through the `style` and `type` variables.

Added in version 3Nov2022.

Global data are calculated at the time they are requested and are only available element-by-element. As such, the user is expected to provide the `nrow` variable to specify which element of a global vector or the `nrow` and `ncol` variables to specify which element of a global array the user wishes LAMMPS to return. The `ncol` variable is optional for global scalar or vector data, and both `nrow` and `ncol` are optional when a global scalar is requested, as well as when per-atom or local data are requested. The following combinations are possible (assuming `lmp` is the name of your LAMMPS instance):

Style	Type	nrow	ncol	Type to assign to	Returned data
lmp%style%global	lmp%type%scalar	Ignored	Ignored	REAL(c_double)	Global scalar
lmp%style%global	lmp%type%vector	Required	Ignored	REAL(c_double)	Element of global vector
lmp%style%global	lmp%type%array	Required	Required	REAL(c_double)	Element of global array
lmp%style%atom	lmp%type%scalar				(not allowed)
lmp%style%atom	lmp%type%vector	Ignored	Ignored	REAL(c_double), DIMENSION(:), POINTER	Per-atom vector
lmp%style%atom	lmp%type%array	Ignored	Ignored	REAL(c_double), DIMENSION(:,:), POINTER	Per-atom array
lmp%style%local	lmp%type%scalar				(not allowed)
lmp%style%local	lmp%type%vector	Ignored	Ignored	REAL(c_double), DIMENSION(:), POINTER	Per-atom vector
lmp%style%local	lmp%type%array	Ignored	Ignored	REAL(c_double), DIMENSION(:,:), POINTER	Per-atom array

In the case of global data, this function returns a value of type `REAL(c_double)`. For per-atom or local data, this function does not return a value but instead associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct type and kind to point to said data (i.e., `REAL(c_double)`) and have compatible rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator.

For example,

```

TYPE(lammops) :: lmp
REAL(c_double) :: dr, dx, dy, dz
! more code to set up, etc.
lmp%command('fix george all recenter 2 2 2')
! more code
dr = lmp%extract_fix("george", lmp%style%global, lmp%style%scalar)
dx = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 1)
dy = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 2)
dz = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 3)

```

will extract the global scalar calculated by `fix recenter` into the variable `dr` and the three elements of the global vector calculated by `fix recenter` into the variables `dx`, `dy`, and `dz`, respectively.

If asked for per-atom or local data, `extract_fix()` returns a pointer to actual LAMMPS data. The pointer returned will have the appropriate size to match the internal data, and will be type/kind/rank-checked at the time of the assignment. For example,

```

TYPE(lammops) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: r
! more code to set up, etc.
lmp%command('fix state all store/state 0 x y z')
! more code
r = lmp%extract_fix('state', lmp%style%atom, lmp%type%array)

```

will bind the pointer *r* to internal LAMMPS data representing the per-atom array computed by *fix store/state* when three inputs are specified. Similarly,

```
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: x
! more code to set up, etc.
lmp%command('fix state all store/state 0 x')
! more code
x = lmp%extract_fix('state', lmp%style%atom, lmp%type%vector)
```

will associate the pointer *x* with internal LAMMPS data corresponding to the per-atom vector computed by *fix store/state* when only one input is specified. Similar examples with *lmp%style%atom* replaced by *lmp%style%local* will extract local data from fixes that define local vectors and/or arrays.

Warning

The pointers returned by this function for per-atom or local data are generally not persistent, since the computed data may be redistributed, reallocated, and reordered at every invocation of the fix. It is thus advisable to re-invoke this function before the data are accessed or to make a copy if the data are to be used after other LAMMPS commands have been issued.

Note

LAMMPS cannot easily check if it is valid to access the data, so it may fail with an error. The caller has to avoid such an error.

Parameters

- **id** [*character(len=*)*] :: string with the name of the fix from which to extract data
- **style** [*integer(c_int)*] :: value indicating the style of data to extract (global, per-atom, or local)
- **type** [*integer(c_int)*] :: value indicating the type of data to extract (scalar, vector, or array)
- **nrow** [*integer(c_int)*] :: row index (used only for global vectors and arrays)
- **ncol** [*integer(c_int)*] :: column index (only used for global arrays)

Call to

lammps_extract_fix()

Return

data [*polymorphic*] :: LAMMPS data (for global data) or a pointer to LAMMPS data (for per-atom or local data). The left-hand side of the assignment should be of type `REAL(c_double)` and have appropriate rank (i.e., `DIMENSION(:)` if expecting per-atom or local vector data and `DIMENSION(:, :)` if expecting per-atom or local array data). If expecting local or per-atom data, it should have the `POINTER` attribute, but if expecting global data, it should be an ordinary (non-`POINTER`) variable.

Array index order

Two-dimensional global, per-atom, or local array data from *extract_fix()* will be **transposed** from equivalent arrays in C (or in the ordinary LAMMPS interface accessed through thermodynamic output), and they

will be indexed from 1, not 0. This is true even for global data, which are returned as scalars—this is done primarily so the interface is consistent, as there is no choice but to transpose the indices for per-atom or local array data. See the similar note under [extract_atom\(\)](#) for further details.

function `extract_variable(name[, group])`

This function calls [lammmps_extract_variable\(\)](#) and returns a scalar, vector, or string containing the value of the variable identified by *name*. When the variable is an *equal*-style variable (or one compatible with that style such as *internal*), the variable is evaluated and the corresponding value returned. When the variable is an *atom*-style variable, the variable is evaluated and a vector of values is returned. With all other variables, a string is returned. The *group* argument is only used for *atom* style variables and is ignored otherwise. If *group* is absent for *atom*-style variables, the group is assumed to be “all”.

Added in version 3Nov2022.

This function returns the values of the variables, not pointers to them. Vectors pointing to *atom*-style variables should be of type `REAL(c_double)`, be of rank 1 (i.e., `DIMENSION(:)`), and have the `ALLOCATABLE` attribute.

Note

Unlike the C library interface, the Fortran interface does not require you to deallocate memory when you are through; this is done for you, behind the scenes.

For example,

```
TYPE(lammmps) :: lmp
REAL(c_double) :: area
! more code to set up, etc.
lmp%command('variable A equal lx*ly')
! more code
area = lmp%extract_variable("A")
```

will extract the *x*–*y* cross-sectional area of the simulation into the variable *area*.

Parameters

name [*character(len=*)*] :: variable name to evaluate

Options

group [*character(len=*), optional*] :: group for which to extract per-atom data (if absent, use “all”)

Call to

[lammmps_extract_variable\(\)](#)

Return

data [*polymorphic*] :: scalar of type `REAL(c_double)` (for *equal*-style variables and others that are *equal*-compatible), vector of type `REAL(c_double)`, `DIMENSION(:)`, `ALLOCATABLE` for *atom*- or *vector*-style variables, or `CHARACTER(LEN=*)` for *string*-style and compatible variables. Strings whose length is too short to hold the result will be truncated. Allocatable strings must be allocated before this function is called; see note at [extract_global\(\)](#) regarding allocatable strings. Allocatable arrays (for *atom*- and *vector*-style data) will be reallocated on assignment.

Note

LAMMPS cannot easily check if it is valid to access the data referenced by the variables (e.g., computes, fixes, or thermodynamic info), so it may fail with an error. The caller has to make certain that the data are extracted only when it is safe to evaluate the variable and thus an error and crash are avoided.

subroutine set_variable(*name*, *str*)

Set the value of a string-style variable.

Deprecated since version 7Feb2024.

This function assigns a new value from the string *str* to the string-style variable *name*. If *name* does not exist or is not a string-style variable, an error is generated.

Warning

This subroutine is deprecated and `set_string_variable()` should be used instead.

Parameters

- **name** [*character(len=*)*] :: name of the variable
- **str** [*character(len=*)*] :: new value to assign to the variable

Call to

`lammmps_set_variable()`

subroutine set_string_variable(*name*, *str*)

Set the value of a string-style variable.

Added in version 7Feb2024.

This function assigns a new value from the string *str* to the string-style variable *name*. If *name* does not exist or is not a string-style variable, an error is generated.

Parameters

- **name** [*character(len=*)*] :: name of the variable
- **str** [*character(len=*)*] :: new value to assign to the variable

Call to

`lammmps_set_string_variable()`

subroutine set_internal_variable(*name*, *val*)

Set the value of an internal-style variable.

Added in version 7Feb2024.

This function assigns a new value from the floating-point number *val* to the internal-style variable *name*. If *name* does not exist or is not an internal-style variable, an error is generated.

Parameters

- **name** [*character(len=*)*] :: name of the variable
- **val** [*real(c_double)*] :: new value to assign to the variable

Call to

lammps_set_internal_variable()

function eval(*expr*)

This function is a wrapper around *lammps_eval()* that takes a LAMMPS equal style variable string, evaluates it and returns the resulting scalar value as a floating-point number.

Added in version 4Feb2025.

Parameters

expr [*character(len=*)*] :: string to be evaluated

Call to

lammps_eval()

Return

value [*real(c_double)*] :: result of the evaluated string

subroutine clearstep_compute()

Clear whether a compute has been invoked

Added in version 4Feb2025.

Call to

lammps_clearstep_compute()

subroutine addstep_compute(*nextstep*)

Add timestep to list of future compute invocations if the compute has been invoked on the current timestep

Added in version 4Feb2025.

overloaded for 32-bit and 64-bit integer arguments

Parameters

nextstep [*integer(kind=8 or kind=4)*] :: next timestep

Call to

lammps_addstep_compute()

subroutine addstep_compute_all(*nextstep*)

Add timestep to list of future compute invocations

Added in version 4Feb2025.

overloaded for 32-bit and 64-bit integer arguments

Parameters

nextstep [*integer(kind=8 or kind=4)*] :: next timestep

Call to

lammps_addstep_compute_all()

subroutine gather_atoms(*name, count, data*)

This function calls `lammops_gather_atoms()` to gather the named atom-based entity for all atoms on all processors and return it in the vector *data*. The vector *data* will be ordered by atom ID, which requires consecutive atom IDs (1 to *natoms*).

Added in version 3Nov2022.

If you need a similar array but have non-consecutive atom IDs, see `gather_atoms_concat()`; for a similar array but for a subset of atoms, see `gather_atoms_subset()`.

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,2), *x*(2,2), *x*(3,2), *x*(1,3), ...]); *data* must be `ALLOCATABLE` and will be allocated to length (*count* × *natoms*), as queried by `get_natoms()`.

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., *x* or *mask*)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x*/*y*/*z* components.
- **data** [*polymorphic,dimension(:),allocatable*] :: array into which to store the data. Array *must* have the `ALLOCATABLE` attribute and be of rank 1 (i.e., `DIMENSION(:)`). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type `INTEGER(c_int)` if expecting integer data and `REAL(c_double)` if expecting floating-point data.

Call to

`lammops_gather_atoms()`

Note

If you want data from this function to be accessible as a two-dimensional array, you can declare a rank-2 pointer and reassign it, like so:

```
USE, INTRINSIC :: ISO_C_BINDING
USE LIBLAMMPS
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:), ALLOCATABLE, TARGET :: xdata
REAL(c_double), DIMENSION(:, :), POINTER :: x
! other code to set up, etc.
CALL lmp%gather_atoms('x', 3, xdata)
x(1:3, 1:size(xdata)/3) => xdata
```

You can then access the *y*-component of atom 3 with `x(2,3)`. See the note about array index order at `extract_atom()`.

subroutine gather_atoms_concat(*name, count, data*)

This function calls `lammops_gather_atoms_concat()` to gather the named atom-based entity for all atoms on all processors and return it in the vector *data*.

Added in version 3Nov2022.

The vector *data* will not be ordered by atom ID, and there is no restriction on the IDs being consecutive. If you need the IDs, you can do another `gather_atoms_concat()` with *name* set to *id*.

If you need a similar array but have consecutive atom IDs, see [gather_atoms\(\)](#); for a similar array but for a subset of atoms, see [gather_atoms_subset\(\)](#).

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., *x* or *mask*)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.
- **data** [*polymorphic,dimension(:),allocatable*] :: array into which to store the data. Array *must* have the `ALLOCATABLE` attribute and be of rank 1 (i.e., `DIMENSION(:)`). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type `INTEGER(c_int)` if expecting integer data and `REAL(c_double)` if expecting floating-point data.

Call to

[lammps_gather_atoms_concat\(\)](#)

subroutine `gather_atoms_subset(name, count, ids, data)`

This function calls [lammps_gather_atoms_subset\(\)](#) to gather the named atom-based entity for the atoms in the array *ids* from all processors and return it in the vector *data*.

Added in version 3Nov2022.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional allocatable array. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use [gather_atoms\(\)](#) or [gather_atoms_concat\(\)](#).

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is [100, 57, 210], then *data* might look like [*x*(1,100), *x*(2,100), *x*(3,100), *x*(1,57), *x*(2,57), *x*(3,57), *x*(1,210), ...]; *ids* must be provided by the user, and *data* must be of rank 1 (i.e., `DIMENSION(:)`) and have the `ALLOCATABLE` attribute.

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., *x* or *mask*)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.
- **ids** [*integer(c_int),dimension(:)*] :: atom IDs corresponding to the atoms to be gathered
- **data** [*polymorphic,dimension(:),allocatable*] :: array into which to store the data. Array *must* have the `ALLOCATABLE` attribute and be of rank 1 (i.e., `DIMENSION(:)`). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type `INTEGER(c_int)` if expecting integer data and `REAL(c_double)` if expecting floating-point data.

Call to

[lammps_gather_atoms_subset\(\)](#)

subroutine scatter_atoms(*name, data*)

This function calls `lammops_scatter_atoms()` to scatter the named atom-based entities in *data* to all processors.

Added in version 3Nov2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processors. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use `scatter_atoms_subset()` to scatter data for some (or all) atoms, in any order.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,2), *x*(2,2), *x*(3,2), *x*(1,3), . . .]); *data* must be of length *natoms* or 3**natoms*.

Parameters

- **name** [*character(len=*)*] :: quantity to be scattered (e.g., *x* or *charge*)
- **data** [*polymorphic,dimension(:)*] :: per-atom values packed in a one-dimensional array containing the data to be scattered. This array must have length *natoms* (e.g., for *type* or *charge*) or length *natoms* × 3 (e.g., for *x* or *f*). The array *data* must be rank 1 (i.e., `DIMENSION(:)`) and be of type `INTEGER(c_int)` (e.g., for *mask* or *type*) or of type `REAL(c_double)` (e.g., for *x* or *charge* or *f*).

Call to

`lammops_scatter_atoms()`

subroutine scatter_atoms_subset(*name, ids, data*)

This function calls `lammops_scatter_atoms_subset()` to scatter the named atom-based entities in *data* to all processors.

Added in version 3Nov2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processors. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array, *ids*. Use `scatter_atoms()` to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of 1 or 3 values, depending on which quantity is being scattered, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,100), *x*(2,100), *x*(3,100), *x*(1,57), *x*(2,57), *x*(3,57)], then *ids* would be [1, 100, 57] and *name* would be *x*.

Parameters

- **name** [*character(len=*)*] :: quantity to be scattered (e.g., *x* or *charge*)
- **ids** [*integer(c_int),dimension(:)*] :: atom IDs corresponding to the atoms being scattered
- **data** [*polymorphic,dimension(:)*] :: per-atom values packed into a one-dimensional array containing the data to be scattered. This array must have either the same length as *ids* (for *mask*, *type*, etc.) or three times its length (for *x*, *f*, etc.); the array must be rank 1 and be of type `INTEGER(c_int)` (e.g., for *mask* or *type*) or of type `REAL(c_double)` (e.g., for *charge*, *x*, or *f*).

Call to

`lammops_scatter_atoms_subset()`

subroutine gather_bonds(*data*)

Gather type and constituent atom information for all bonds.

Added in version 3Nov2022.

This function copies the list of all bonds into an allocatable array. The array will be filled with (bond type, bond atom 1, bond atom 2) for each bond. The array is allocated to the right length (i.e., three times the number of bonds). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t), depending on whether -DLAMMPS_BIGBIG was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM bonds
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  USE LIBLAMMPS
  IMPLICIT NONE
  INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: bonds
  INTEGER(c_int), DIMENSION(:,:), POINTER :: bonds_array
  TYPE(lammps) :: lmp
  INTEGER :: i
  ! other commands to initialize LAMMPS, create bonds, etc.
  CALL lmp%gather_bonds(bonds)
  bonds_array(1:3, 1:SIZE(bonds)/3) => bonds
  DO i = 1, SIZE(bonds)/3
    WRITE(OUTPUT_UNIT, '(A,1X,I4,A,I4,1X,I4)') 'bond', bonds_array(1,i), &
      'type = ', bonds_array(2,i), bonds_array(3,i)
  END DO
END PROGRAM bonds
```

Parameters

data [*integer(kind=*)*,*allocatable*] :: array into which to copy the result. *The KIND parameter is either c_int or, if LAMMPS was compiled with -DLAMMPS_BIGBIG, kind c_int64_t.

Call to

lammps_gather_bonds()

subroutine gather_angles(*data*)

Gather type and constituent atom information for all angles.

Added in version 8Feb2023.

This function copies the list of all angles into an allocatable array. The array will be filled with (angle type, angle atom 1, angle atom 2, angle atom 3) for each angle. The array is allocated to the right length (i.e., four times the number of angles). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t), depending on whether -DLAMMPS_BIGBIG was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM angles
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
```

(continues on next page)

(continued from previous page)

```

USE LIBLAMMPS
IMPLICIT NONE
INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: angles
INTEGER(c_int), DIMENSION(:,:), POINTER :: angles_array
TYPE(lammps) :: lmp
INTEGER :: i
! other commands to initialize LAMMPS, create angles, etc.
CALL lmp%gather_angles(angles)
angles_array(1:4, 1:SIZE(angles)/4) => angles
DO i = 1, SIZE(angles)/4
  WRITE(OUTPUT_UNIT, '(A,1X,I4,A,I4,1X,I4,1X,I4)') 'angle', angles_array(1,i), &
    '; type = ', angles_array(2,i), angles_array(3,i), angles_array(4,i)
END DO
END PROGRAM angles

```

Parameters

data [*integer(kind=*)*,*allocatable*] :: array into which to copy the result. *The KIND parameter is either *c_int* or, if LAMMPS was compiled with `-DLAMMPS_BIGBIG`, kind *c_int64_t*.

Call to

lammps_gather_angles()

subroutine gather(*self, name, count, data*)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, in order by atom ID.

Added in version 22Dec2022.

This subroutine gathers data from all processes and stores them in a one-dimensional allocatable array. The array *data* will be ordered by atom ID, which requires consecutive IDs (1 to *natoms*). If you need a similar array but for non-consecutive atom IDs, see *lammps_gather_concat()*; for a similar array but for a subset of atoms, see *lammps_gather_subset()*.

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x*, then *data* is [x(1,1), x(2,1), x(3,1), x(1,2), x(2,2), x(3,2), x(1,3), ...]); *data* must be ALLOCATABLE and will be allocated to length (*count* × *natoms*), as queried by *get_natoms()*.

This function will return an error if fix or compute data are requested and the fix or compute ID given does not have per-atom data. See the note about re-interpreting the vector as a matrix at *gather_atoms()*.

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., “x” or “mask” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **count** [*integer(c_int)*] :: number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (x,y,z) components.
- **data** [*real(c_double)*,*dimension(:)*,*allocatable*] :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data.

Call to*lammgs_gather()***subroutine gather_dihedrals**(*data*)

Gather type and constituent atom information for all dihedrals.

Added in version 8Feb2023.

This function copies the list of all dihedrals into an allocatable array. The array will be filled with (dihedral type, dihedral atom 1, dihedral atom 2, dihedral atom 3, dihedral atom 4) for each dihedral. The array is allocated to the right length (i.e., five times the number of dihedrals). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t), depending on whether -DLAMMPS_BIGBIG was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM dihedrals
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  USE LIBLAMMPS
  IMPLICIT NONE
  INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: dihedrals
  INTEGER(c_int), DIMENSION(:, :), POINTER :: dihedrals_array
  TYPE(lammps) :: lmp
  INTEGER :: i
  ! other commands to initialize LAMMPS, create dihedrals, etc.
  CALL lmp%gather_dihedrals(dihedrals)
  dihedrals_array(1:5, 1:SIZE(dihedrals)/5) => dihedrals
  DO i = 1, SIZE(dihedrals)/5
    WRITE(OUTPUT_UNIT, '(A,1X,I4,A,I4,1X,I4,1X,I4,1X,I4)') 'dihedral', dihedrals_
    →array(1,i), &
    →'; type = ', dihedrals_array(2,i), dihedrals_array(3,i), dihedrals_array(4,i),
    → dihedrals_array(5,i)
  END DO
END PROGRAM dihedrals
```

Parameters

data [*integer(kind=*)*,*allocatable*] :: array into which to copy the result. *The KIND parameter is either c_int or, if LAMMPS was compiled with -DLAMMPS_BIGBIG, kind c_int64_t.

Call to*lammgs_gather_dihedrals()***subroutine gather_impropers**(*data*)

Gather type and constituent atom information for all impropers.

Added in version 8Feb2023.

This function copies the list of all impropers into an allocatable array. The array will be filled with (improper type, improper atom 1, improper atom 2, improper atom 3, improper atom 4) for each improper. The array is allocated to the right length (i.e., five times the number of impropers). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t),

depending on whether `-DLAMMPS_BIGBIG` was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM impropers
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  USE LIBLAMMPS
  IMPLICIT NONE
  INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: impropers
  INTEGER(c_int), DIMENSION(:,:), POINTER :: impropers_array
  TYPE(lammps) :: lmp
  INTEGER :: i
  ! other commands to initialize LAMMPS, create impropers, etc.
  CALL lmp%gather_impropers(impropers)
  impropers_array(1:5, 1:SIZE(impropers)/5) => impropers
  DO i = 1, SIZE(impropers)/5
    WRITE(OUTPUT_UNIT, '(A,1X,I4,A,1X,I4,1X,I4,1X,I4,1X,I4)') 'improper', impropers_
    → array(1,i), &
    ' ; type = ', impropers_array(2,i), impropers_array(3,i), impropers_array(4,i),
    → impropers_array(5,i)
  END DO
END PROGRAM impropers
```

Parameters

data [*integer(kind=*)*,*allocatable*] :: array into which to copy the result. *The KIND parameter is either `c_int` or, if LAMMPS was compiled with `-DLAMMPS_BIGBIG`, kind `c_int64_t`.

Call to

`lammps_gather_impropers()`

subroutine `gather_concat(self, name, count, data)`

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, unordered.

Added in version 22Dec2022.

This subroutine gathers data for all atoms and stores them in a one-dimensional allocatable array. The data will be a concatenation of chunks from each processor's owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each atom, you can do another call to either `gather_atoms_concat()` or `gather_concat()` with *name* set to `id`. If you have consecutive IDs and want the data to be in order, use `gather()`; for a similar array but for a subset of atoms, use `gather_subset()`.

The *data* array will be in groups of *count* values, with *natoms* groups total, but not in order by atom ID (e.g., if *name* is *x* and *count* is 3, then *data* might be something like [x(1,11), x(2,11), x(3,11), x(1,3), x(2,3), x(3,3), x(1,5), ...]); *data* must be `ALLOCATABLE` and will be allocated to length (*count* × *natoms*), as queried by `get_natoms()`.

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., “x” or “mask” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.
- **data** [*polymorphic,dimension(:),allocatable*] :: array into which to store the data. Array *must* have the `ALLOCATABLE` attribute and be of rank 1 (i.e., `DIMENSION(:)`). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type `INTEGER(c_int)` if expecting integer data and `REAL(c_double)` if expecting floating-point data.

Call to

`lammgs_gather_concat()`

subroutine `gather_subset(name, count, ids, data)`

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes for a subset of atoms.

Added in version 22Dec2022.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional allocatable array. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use `gather()` or `gather_concat()`.

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is [100, 57, 210], then *data* might look like $[x(1,100), x(2,100), x(3,100), x(1,57), x(2,57), x(3,57), x(1,210), \dots]$; *ids* must be provided by the user, and *data* must have the `ALLOCATABLE` attribute and be of rank 1 (i.e., `DIMENSION(:)`). If *data* is already allocated, it will be reallocated to fit the length of the incoming data.

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: quantity to be scattered
- **ids** [*integer(c_int),dimension(:)*] :: atom IDs corresponding to the atoms being scattered (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.
- **data** [*polymorphic,dimension(:),allocatable*] :: per-atom values packed into a one-dimensional array containing the data to be scattered. This array must have the `ALLOCATABLE` attribute and will be allocated either to the same length as *ids* (for *mask*, *type*, etc.) or to three times its length (for *x*, *f*, etc.); the array must be rank 1 and be of type `INTEGER(c_int)` (e.g., for *mask* or *type*) or of type `REAL(c_double)` (e.g., for *charge*, *x*, or *f*).

Call to

`lammgs_gather_subset()`

subroutine scatter(*name, data*)

This function calls `lammops_scatter()` to scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entity in *data* to all processes.

Added in version 22Dec2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use `scatter_subset()` to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,2), *x*(2,2), *x*(3,2), *x*(1,3), ...]); *data* must be of length (*count* × *natoms*).

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **data** [*polymorphic,dimension(:)*] :: per-atom values packed in a one-dimensional array; *data* should be of type INTEGER(*c_int*) or REAL(*c_double*), depending on the type of data being scattered, and be of rank 1 (i.e., DIMENSION(:)).

Call to

`lammops_scatter()`

subroutine scatter_subset(*name, ids, data*)

This function calls `lammops_scatter_subset()` to scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities in *data* from a subset of atoms to all processes.

Added in version 22Dec2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array. Use `scatter()` to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of *count* values, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,100), *x*(2,100), *x*(3,100), *x*(1,57), *x*(2,57), *x*(3,57)], then *count* = 3 and *ids* = [1, 100, 57].

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., “x” or “mask” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **ids** [*integer(c_int)*] :: list of atom IDs to scatter data for
- **data** [*polymorphic,dimension(:)*] :: per-atom values packed in a one-dimensional array of length *size(ids)* * *count*.

Call to

`lammops_scatter_subset()`

function `create_atoms([id,] type, x, [v,] [image,] [bexpand])`

This method calls `lammops_create_atoms()` to create additional atoms from a given list of coordinates and a list of atom types. Additionally, the atom IDs, velocities, and image flags may be provided.

Added in version 3Nov2022.

Parameters

- **type** [*integer(c_int),dimension(N)*] :: vector of N atom types (required/see note below)
- **x** [*real(c_double),dimension(3N)*] :: vector of $3N$ $x/y/z$ positions of the new atoms, arranged as $[x_1, y_1, z_1, x_2, y_2, \dots]$ (required/see note below)

Options

- **id** [*integer(kind=*),dimension(N),optional*] :: vector of N atom IDs; if absent, LAMMPS will generate them for you. *The KIND parameter should be `c_int` unless LAMMPS was compiled with `-DLAMMPS_BIGBIG`, in which case it should be `c_int64_t`.
- **v** [*real(c_double),dimension(3N),optional*] :: vector of $3N$ $x/y/z$ velocities of the new atoms, arranged as $[v_{1,x}, v_{1,y}, v_{1,z}, v_{2,x}, \dots]$; if absent, they will be set to zero
- **image** [*integer(kind=*),dimension(N),optional*] :: vector of N image flags; if absent, they are set to zero. *The KIND parameter should be `c_int` unless LAMMPS was compiled with `-DLAMMPS_BIGBIG`, in which case it should be `c_int64_t`. See note below.
- **bexpand** [*logical,optional*] :: if `.TRUE.`, atoms outside of shrink-wrap boundaries will be created, not dropped, and the box dimensions will be extended. Default is `.FALSE.`

Return

atoms [*integer(c_int)*] :: number of created atoms

Call to

`lammops_create_atoms()`

Note

The *type* and *x* arguments are required, but they are declared OPTIONAL in the module because making them mandatory would require *id* to be present as well. To have LAMMPS generate the ids for you, use a call something like

```
lmp%create_atoms(type=new_types, x=new_xs)
```

Note

When LAMMPS has been compiled with `-DLAMMPS_BIGBIG`, it is not possible to include the *image* parameter but omit the *id* parameter. Either *id* must be present, or both *id* and *image* must be absent. This is required because having all arguments be optional in both generic functions creates an ambiguous interface. This limitation does not exist if LAMMPS was not compiled with `-DLAMMPS_BIGBIG`.

subroutine `create_molecule(id, jsonstr)`

Add molecule template from string with JSON data

Added in version 22Jul2025.

Parameters

- **id** [*character(len=*)*] :: desired molecule-ID
- **jsonstr** [*character(len=*)*] :: string with JSON data defining the molecule template

Call to

`lammmps_create_molecule()`

function find_pair_neighlist(*style*[, *exact*][, *nsub*][, *reqid*])

Find index of a neighbor list requested by a pair style.

Added in version 3Nov2022.

This function determines which of the available neighbor lists for pair styles matches the given conditions. It first matches the style name. If *exact* is `.TRUE.`, the name must match exactly; if `.FALSE.`, a regular expression or sub-string match is done. If the pair style is *hybrid* or *hybrid/overlay*, the style is matched against the sub-styles instead. If the same pair style is used multiple times as a sub-style, the *nsub* argument must be > 0 ; this argument represents the *n*th instance of the sub-style (same as for the *pair_coeff* command, for example). In that case, *nsub* = 0 will not produce a match, and the function will return -1 .

The final condition to be checked is the request ID (*reqid*). This will usually be zero, but some pair styles request multiple neighbor lists and set the request ID to a value greater than zero.

Parameters

style [*character(len=*)*] :: String used to search for pair style instance.

Options

- **exact** [*logical,optional*] :: Flag to control whether style should match exactly or only a regular expression/sub-string match is applied. Default: `.TRUE.`
- **nsub** [*integer(c_int),optional*] :: Match *nsub*th hybrid sub-style instance of the same style. Default: 0.
- **reqid** [*integer(c_int),optional*] :: Request ID to identify the neighbor list in case there are multiple requests from the same pair style instance. Default: 0.

Call to

`lammmps_find_pair_neighlist()`

Return

index [*integer(c_int)*] :: Neighbor list index if found, otherwise -1 .

function find_fix_neighlist(*id*[, *reqid*])

Find index of a neighbor list requested by a fix.

Added in version 3Nov2022.

The neighbor list request from a fix is identified by the fix ID and the request ID. The request ID is typically zero, but will be > 0 for fixes with multiple neighbor list requests.

Parameters

id [*character(len=*)*] :: Identifier of fix instance

Options

reqid [*integer(c_int),optional*] :: request ID to identify the neighbor list in cases in which there are multiple requests from the same fix. Default: 0.

Call to`lammops_find_fix_neighlist()`**Return**`index [integer(c_int)] :: neighbor list index if found, otherwise -1`

function find_compute_neighlist(*id* [, *reqid*])

Find index of a neighbor list requested by a compute.

Added in version 3Nov2022.

The neighbor list request from a compute is identified by the compute ID and the request ID. The request ID is typically zero, but will be > 0 in case a compute has multiple neighbor list requests.

Parameters

`id [character(len=*)]` :: Identifier of compute instance.

Options

`reqid [integer(c_int),optional]` :: request ID to identify the neighbor list in cases in which there are multiple requests from the same compute. Default: 0.

Call to`lammops_find_compute_neighlist()`**Return**`index [integer(c_int)] :: neighbor list index if found, otherwise -1.`

function neighlist_num_elements(*idx*)

Return the number of entries in the neighbor list with the given index.

Added in version 3Nov2022.

Parameters

`idx [integer(c_int)]` :: neighbor list index

Call to`lammops_neighlist_num_elements() lammops_neighlist_num_elements()`**Return**`inum [integer(c_int)] :: number of entries in neighbor list, or -1 if idx is not a valid index.`

subroutine neighlist_element_neighbors(*idx*, *element*, *iatom*, *neighbors*)

Return atom local index, number of neighbors, and array of neighbor local atom indices of a neighbor list entry.

Added in version 3Nov2022.

Parameters

- `idx [integer(c_int)]` :: index of this neighbor list in the list of all neighbor lists
- `element [integer(c_int)]` :: index of this neighbor list entry
- `iatom [integer(c_int)]` :: local atom index (i.e., in the range [1,nlocal+nghost]; -1 if invalid or element value
- `neighbors [integer(c_int),dimension(:),pointer]` :: pointer to an array of neighboring atom local indices

Call to

`lammops_neighlist_element_neighbors()`

function version()

This method returns the numeric LAMMPS version like `lammops_version()` does.

Call to

`lammops_version()`

Return

version [*integer*] :: LAMMPS version

subroutine get_os_info(buffer)

This function can be used to retrieve detailed information about the hosting operating system and compiler/runtime environment.

Added in version 3Nov2022.

A suitable buffer has to be provided. The assembled text will be truncated so as not to overflow this buffer. The string is typically a few hundred bytes long.

Parameters

buffer [*character(len=*)*] :: string that will house the information.

Call to

`lammops_get_os_info()`

function config_has_mpi_support()

This function is used to query whether LAMMPS was compiled with a real MPI library or in serial.

Added in version 3Nov2022.

Call to

`lammops_config_has_mpi_support()`

Return

has_mpi [*logical*] :: `.FALSE.` when compiled with STUBS, `.TRUE.` if compiled with MPI.

function config_has_omp_support()

This function is used to query whether LAMMPS was compiled with OpenMP enabled.

Added in version 10Sep2025.

Call to

`lammops_config_has_omp_support()`

Return

has_omp [*logical*] :: `.TRUE.` when compiled with OpenMP enabled, `.FALSE.` if not.

function config_has_gzip_support()

Check if the LAMMPS library supports reading or writing compressed files via a pipe to gzip or similar compression programs.

Added in version 3Nov2022.

Several LAMMPS commands (e.g., *read_data command*, *write_data command*, *dump styles atom, custom, and xyz*) support reading and writing compressed files via creating a pipe to the gzip program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether gzip or any other supported compression programs themselves are installed and usable.

Call to

lammeps_config_has_gzip_support()

Return

has_gzip [logical]

function config_has_png_support()

Check if the LAMMPS library supports writing PNG format images.

Added in version 3Nov2022.

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the *PNG image file format* is available in the current LAMMPS library.

Call to

lammeps_config_has_png_support()

Return

has_png [logical]

function config_has_jpeg_support()

Check if the LAMMPS library supports writing JPEG format images.

Added in version 3Nov2022.

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the *JPEG image file format* is available in the current LAMMPS library.

Call to

lammeps_config_has_jpeg_support()

Return

has_jpeg [logical]

function config_has_ffmpeg_support()

Check if the LAMMPS library supports creating movie files via a pipe to ffmpeg.

Added in version 3Nov2022.

The LAMMPS *dump style movie* supports generating movies from images on-the-fly via creating a pipe to the *ffmpeg* program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether the *ffmpeg* itself is installed and usable.

Call to

`lammops_config_has_ffmpeg_support()`

Return

`has_ffmpeg` [logical]

function config_has_exceptions()

Check whether LAMMPS errors will throw C++ exceptions.

Added in version 3Nov2022.

When using the library interface, the library interface functions will “catch” exceptions, and then the error status can be checked by calling `has_error()`. The most recent error message can be retrieved via `get_last_error_message()`. This allows to restart a calculation or delete and recreate the LAMMPS instance when a C++ exception occurs. One application of using exceptions this way is [LAMMPS-GUI](#)

Call to

`lammops_config_has_exceptions()`

Return

`has_exceptions` [logical]

function config_has_package(name)

Check whether a specific package has been included in LAMMPS

Added in version 3Nov2022.

This function checks whether the LAMMPS library in use includes the specific *LAMMPS package* provided as argument.

Call to

`lammops_config_has_package()`

Return

`has_package` [logical]

function config_package_count()

Count the number of installed packages in the LAMMPS library.

Added in version 3Nov2022.

This function counts how many *LAMMPS packages* are included in the LAMMPS library in use. It directly calls the C library function `lammops_config_package_count()`.

Call to

`lammops_config_package_count()`

Return

`npackages` [integer(c_int)] :: number of packages installed

subroutine config_package_name(*idx*, *buffer*)

Get the name of a package in the list of installed packages in the LAMMPS library.

Added in version 3Nov2022.

This subroutine copies the name of the package with the index *idx* into the provided string *buffer*. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, *buffer* is set to an empty string.

Parameters

- **idx** [*integer(c_int)*] :: index of the package in the list of included packages ($0 \leq idx < \text{package count}$)
- **buffer** [*character(len=*)*] :: string to hold the name of the package

Call to

[lammps_config_package_name\(\)](#)

subroutine installed_packages(*package*[, *length*])

Obtain a list of the names of enabled packages in the LAMMPS shared library and store it in *package*.

Added in version 3Nov2022.

This function is analogous to the [installed_packages](#) function in the Python API. The optional argument *length* sets the length of each string in the vector *package* (default: 31).

Parameters

package [*character(len=:)*,*dimension(:)*,*allocatable*] :: list of packages; *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)) with allocatable length.

Options

length [*integer,optional*] :: length of each string in the list. Default: 31.

Call to

[lammps_config_package_count\(\)](#) [lammps_config_package_name\(\)](#)

function config_accelerator(*package*, *category*, *setting*)

This function calls [lammps_config_accelerator\(\)](#) to check the availability of compile time settings of included *accelerator packages* in LAMMPS.

Added in version 3Nov2022.

Supported packages names are “GPU”, “KOKKOS”, “INTEL”, and “OPENMP”. Supported categories are “api” with possible settings “cuda”, “hip”, “phi”, “pthreads”, “opencl”, “openmp”, and “serial”; and “precision” with possible settings “double”, “mixed”, and “single”.

Parameters

- **package** [*character(len=*)*] :: string with the name of the accelerator package
- **category** [*character(len=*)*] :: string with the name of the setting
- **setting** [*character(len=*)*] :: string with the name of the specific setting

Call to

[lammps_config_accelerator\(\)](#)

Return

available [*logical*] :: .TRUE. if the combination of package, category, and setting is available, otherwise .FALSE..

function has_gpu_device()

Checks for the presence of a viable GPU package device.

Added in version 3Nov2022.

This function calls [lammmps_has_gpu_device\(\)](#), which checks at runtime whether an accelerator device is present that can be used with the *GPU package*.

More detailed information about the available device or devices can be obtained by calling the [get_gpu_device_info\(\)](#) subroutine.

Call to

[lammmps_has_gpu_device\(\)](#)

Return

available [*logical*] :: .TRUE. if a viable device is available, .FALSE. if not.

subroutine get_gpu_device_info(buffer)

Get GPU package device information.

Added in version 3Nov2022.

Calls [lammmps_get_gpu_device_info\(\)](#) to retrieve detailed information about any accelerator devices that are viable for use with the *GPU package*. It will fill *buffer* with a string that is equivalent to the output of the `nvc_get_device` or `ocl_get_device` or `hip_get_device` tools that are compiled alongside LAMMPS if the GPU package is enabled.

A suitable-length Fortran string has to be provided. The assembled text will be truncated so as not to overflow this buffer. This string can be several kilobytes long if multiple devices are present.

Parameters

buffer [*character(len=*)*] :: string into which to copy the information.

Call to

[lammmps_get_gpu_device_info\(\)](#)

function has_style(category, name)

Check whether a specific style has been included in LAMMPS.

Added in version 3Nov2022.

This function calls [lammmps_has_style\(\)](#) to check whether the LAMMPS library in use includes the specific style *name* associated with a specific *category* provided as arguments. Please see [lammmps_has_style\(\)](#) for a list of valid categories.

Parameters

- **category** [*character(len=*)*] :: category of the style
- **name** [*character(len=*)*] :: name of the style

Call to

[lammmps_has_style\(\)](#)

Return

has_style [*logical*] :: .TRUE. if included, .FALSE. if not.

function style_count(*category*)

Count the number of styles of *category* in the LAMMPS library.

Added in version 3Nov2022.

This function counts how many styles in the provided *category* are included in the LAMMPS library currently in use. Please see [lammips_has_style\(\)](#) for a list of valid categories.

Parameters

category [*character(len=*)*] :: category of styles to count

Call to

[lammips_style_count\(\)](#)

Return

count [*integer(c_int)*] :: number of styles in *category*

subroutine style_name(*category*, *idx*, *buffer*)

Look up the name of a style by index in the list of styles of a given category in the LAMMPS library.

Added in version 3Nov2022.

This function calls [lammips_style_name\(\)](#) and copies the name of the *category* style with index *idx* into the provided string *buffer*. The length of *buffer* must be long enough to contain the name of the style; if it is too short, the name will be truncated accordingly. If *idx* is out of range, *buffer* will be the empty string and a warning will be issued.

Parameters

- **category** [*character(len=*)*] :: category of styles
- **idx** [*integer(c_int)*] :: index of the style in the list of *category* styles ($1 \leq idx \leq$ style count)
- **buffer** [*character(len=*)*] :: string buffer to copy the name of the style into

Call to

[lammips_style_name\(\)](#)

function has_id(*category*, *name*)

This function checks if the current LAMMPS instance a *category* ID of the given *name* exists. Valid categories are: *compute*, *dump*, *fix*, *group*, *molecule*, *region*, and *variable*.

Added in version 3Nov2022.

Parameters

- **category** [*character(len=*)*] :: category of the ID
- **name** [*character(len=*)*] :: name of the ID

Call to

[lammips_has_id\(\)](#)

Return

has_id [*logical*] :: `.TRUE.` if *category* style *name* exists, `.FALSE.` if not.

function id_count(*category*)

This function counts how many IDs in the provided *category* are defined in the current LAMMPS instance. Please see [has_id\(\)](#) for a list of valid categories.

Added in version 3Nov2022.

Parameters

category [*character(len=*)*] :: category of the ID

Call to

[lammmps_id_count\(\)](#)

Return

count [*integer(c_int)*] :: number of IDs in *category*

subroutine id_name(*category*, *idx*, *buffer*)

Look up the name of an ID by index in the list of IDs of a given category.

Added in version 3Nov2022.

This function copies the name of the *category* ID with the index *idx* into the provided string *buffer*. The length of the buffer must be long enough to hold the string; if the name of the style exceeds the length of the buffer, it will be truncated accordingly. If *buffer* is ALLOCATABLE, it must be allocated *before* the function is called. If *idx* is out of range, *buffer* is set to an empty string and a warning is issued.

Parameters

- **category** [*character(len=*)*] :: category of IDs
- **idx** [*integer(c_int)*] :: index of the ID in the list of *category* styles ($0 \leq idx < count$)
- **buffer** [*character(len=*)*] :: string into which to copy the name of the style

Call to

[lammmps_id_name\(\)](#)

function plugin_count()

This function counts the number of loaded plugins.

Added in version 3Nov2022.

Call to

[lammmps_plugin_count\(\)](#)

Return

n [*integer(c_int)*] :: number of loaded plugins

subroutine plugin_name(*idx*, *stylebuf*, *namebuf*)

Look up the style and name of a plugin by its index in the list of plugins.

Added in version 3Nov2022.

This function copies the name of the *style* plugin with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, both strings are set to the empty string and a warning is printed.

Parameters

- **idx** [*integer(c_int)*] :: index of the plugin in the list all or *style* plugins
- **stylebuf** [*character(len=*)*] :: string into which to copy the style of the plugin
- **namebuf** [*character(len=*)*] :: string into which to copy the style of the plugin

Call to

```
lammmps_plugin_name()
```

function encode_image_flags(*ix, iy, iz*)

Encodes three integer image flags into a single imageint.

Added in version 3Nov2022.

This function performs the bit-shift, addition, and bit-wise OR operations necessary to combine the values of three integers representing the image flags in the *x*-, *y*-, and *z*-directions. Unless LAMMPS is compiled with `-DLAMMPS_BIGBIG`, those integers are limited to 10-bit signed integers `[-512, 512)`. If `-DLAMMPS_BIGBIG` was used when compiling, then the return value is of kind `c_int64_t` instead of kind `c_int`, and the valid range for the individual image flags becomes `[-1048576, 1048575)` (i.e., the range of a 21-bit signed integer). There is no check on whether the arguments conform to these requirements; values out of range will simply be wrapped back into the interval.

Parameters

- **ix** [*integer(c_int)*] :: image flag in *x*-direction
- **iy** [*integer(c_int)*] :: image flag in *y*-direction
- **iz** [*integer(c_int)*] :: image flag in *z*-direction

Return

imageint [*integer(kind=*)*] :: encoded image flag. *The KIND parameter is `c_int` unless LAMMPS was built with `-DLAMMPS_BIGBIG`, in which case it is `c_int64_t`.

Note

The fact that the programmer does not know the KIND parameter of the return value until compile time means that it is impossible to define an interface that works for both sizes of **imageint**. One side effect of this is that you must assign the return value of this function to a variable; it cannot be used as the argument to another function or as part of an array constructor. For example,

```
my_images = [lmp%encode_image_flags(0,0,0), lmp%encode_image_flags(1,0,0)]
```

will *not* work; instead, do something like

```
my_images(1) = lmp%encode_image_flags(0,0,0)
my_images(2) = lmp%encode_image_flags(1,0,0)
```

subroutine decode_image_flags(*image, flags*)

This function does the reverse operation of [encode_image_flags\(\)](#): it takes the image flag and performs the bit-shift and bit-masking operations to decode it and stores the resulting three integers into the array *flags*.

Added in version 3Nov2022.

Parameters

- **image** [*integer(kind=*)*] :: encoded image flag. *The KIND parameter is either `c_int` or, if LAMMPS was compiled with `-DLAMMPS_BIGBIG`, `c_int64_t`. Kind compatibility is checked at run-time.
 - **flags** [*integer(c_int),dimension(3)*] :: three-element vector where the decoded image flags will be stored.
-

subroutine set_fix_external_callback(id, callback, caller)

Set the callback function for a *fix external* instance with the given ID.

Added in version 22Dec2022.

Fix *external* allows programs that are running LAMMPS through its library interface to modify certain LAMMPS properties on specific time steps, similar to the way other fixes do.

This subroutine sets the callback function for use with the “pf/callback” mode. The function should have Fortran language bindings with the following interface, which depends on how LAMMPS was compiled:

ABSTRACT INTERFACE

```
SUBROUTINE external_callback(caller, timestep, ids, x, fexternal)
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int, c_double, c_int64_t
  CLASS(*), INTENT(INOUT) :: caller
  INTEGER(c_bigint), INTENT(IN) :: timestep
  INTEGER(c_tagint), DIMENSION(:), INTENT(IN) :: ids
  REAL(c_double), DIMENSION(:, :), INTENT(IN) :: x
  REAL(c_double), DIMENSION(:, :), INTENT(OUT) :: fexternal
END SUBROUTINE external_callback
END INTERFACE
```

where `c_bigint` is `c_int64_t` and `c_tagint` is `c_int64_t` if `-DLAMMPS_BIGBIG` was used and `c_int` otherwise.

The argument *caller* to `set_fix_external_callback()` is unlimited polymorphic (i.e., it can be any Fortran object you want to pass to the calling function) and will be available as the first argument to the callback function. It can be your LAMMPS instance, which you might need if the callback function needs access to the library interface. The argument must be a scalar; to pass non-scalar data, wrap those data in a derived type and pass an instance of the derived type to *caller*.

The array *ids* is an array of length *nlocal* (as accessed from the `Atom` class or through `extract_global()`). The arrays *x* and *fexternal* are $3 \times nlocal$ arrays; these are transposed from what they would look like in C (see note about array index order at `extract_atom()`).

The callback mechanism is one of two ways that forces can be applied to a simulation with the help of *fix external*. The alternative is *array* mode, where one calls `fix_external_get_force()`.

Please see the documentation for *fix external* for more information about how to use the fix and couple it with external programs.

Parameters

- **id** [*character(len=*)*] :: ID of *fix external* instance
- **callback** [*external*] :: subroutine *fix external* should call
- **caller** [*class(*),optional*] :: object you wish to pass to the callback procedure (must be a scalar; see note)

Call to

`lammps_set_fix_external_callback()`

Note

The interface for your callback function must match types precisely with the abstract interface block given above. **The compiler probably will not be able to check this for you.** In particular, the first argument (“caller”) must be of type CLASS(*) or you will probably get a segmentation fault or at least a misinterpretation of whatever is in memory there. You can resolve the object using the SELECT TYPE construct. An example callback function (assuming LAMMPS was compiled with -DLAMMPS_SMALLBIG) that applies something akin to Hooke’s Law (with each atom having a different k value) is shown below.

```

MODULE stuff
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int, c_double, c_int64_t
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : error_unit
  IMPLICIT NONE

  TYPE shield
    REAL(c_double), DIMENSION(:,:), ALLOCATABLE :: k
    ! assume k gets allocated to dimension(3,nlocal) at some point
    ! and assigned values
  END TYPE shield

  SUBROUTINE my_callback(caller, timestep, ids, x, fexternal)
    CLASS(*), INTENT(INOUT) :: caller
    INTEGER(c_int), INTENT(IN) :: timestep
    INTEGER(c_int64_t), INTENT(IN) :: ids
    REAL(c_double), INTENT(IN) :: x(:, :)
    REAL(c_double), INTENT(OUT) :: fexternal(:, :)

    SELECT TYPE (caller)
      TYPE IS (shield)
        fexternal = - caller%k * x
      CLASS DEFAULT
        WRITE(error_unit,*) 'UH OH...'
    END SELECT
  END SUBROUTINE my_callback
END MODULE stuff

! then, when assigning the callback function, do this:
PROGRAM example
  USE LIBLAMMPS
  USE stuff
  TYPE(lammps) :: lmp
  TYPE(shield) :: my_shield
  lmp = lammps()
  CALL lmp%command('fix ext all external pf/callback 1 1')
  CALL lmp%set_fix_external_callback('ext', my_callback, my_shield)
END PROGRAM example

```

function fix_external_get_force(id)

Get pointer to the force array storage in a fix external instance with the given ID.

Added in version 22Dec2022.

Fix *external* allows programs that are running LAMMPS through its library interfaces to add or modify certain LAMMPS properties on specific time steps, similar to the way other fixes do.

This function provides access to the per-atom force storage in a fix external instance with the given fix-ID to be added to the individual atoms when using the “pf/array” mode. The *fexternal* array can be accessed like other “native” per-atom arrays accessible via the *extract_atom()* function. Please note that the array stores the forces for *local* atoms for each MPI rank, in the order determined by the neighbor list build. Because the underlying data structures can change as well as the order of atom as they migrate between MPI processes because of the domain decomposition parallelization, this function should be always called immediately before the forces are going to be set to get an up-to-date pointer. You can use, for example, *extract_setting()* to obtain the number of local atoms *nlocal* and then assume the dimensions of the returned force array as `REAL(c_double) :: force(3,nlocal)`.

This function is an alternative to the callback mechanism in fix external set up by *set_fix_external_callback()*. The main difference is that this mechanism can be used when forces are to be pre-computed and the control alternates between LAMMPS and the external driver, while the callback mechanism can call an external subroutine to compute the force when the fix is triggered and needs them.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

id [*character(len=*)*] :: ID of *fix external* instance

Call to

lammops_fix_external_get_force()

Return

fexternal [*real(c_double),dimension(3,nlocal)*] :: pointer to the per-atom force array allocated by the fix

subroutine fix_external_set_energy_global(id, eng)

Set the global energy contribution for a *fix external* instance with the given ID.

Added in version 22Dec2022.

This is a companion function to *set_fix_external_callback()* and *fix_external_get_force()* that also sets the contribution to the global energy from the external program. The value of the *eng* argument will be stored in the fix and applied on the current and all following time steps until changed by another call to this function. The energy is in energy units as determined by the current *units* settings and is the **total** energy of the contribution. Thus, when running in parallel, all MPI processes have to call this function with the **same** value, and this will be returned as a scalar property of the fix external instance when accessed in LAMMPS input commands or from variables.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

- **id** [*character(len=*)*] :: fix ID of fix external instance
- **eng** [*real(c_double)*] :: total energy to be added to the global energy

Call to

lammops_fix_external_set_energy_global()

subroutine `fix_external_set_virial_global(id, virial)`

Set the global virial contribution for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to `set_fix_external_callback()` and `fix_external_get_force()` to set the contribution to the global virial from an external program.

The six values of the *virial* array will be stored in the fix and applied on the current and all following time steps until changed by another call to this function. The components of the virial need to be stored in the following order: *xx*, *yy*, *zz*, *xy*, *xz*, *yz*. In LAMMPS, the virial is stored internally as *stress*volume* in units of *pressure*volume* as determined by the current *units* settings and is the **total** contribution. Thus, when running in parallel, all MPI processes have to call this function with the **same** value, and this will then be added by fix external.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **id** [*character(len=*)*] :: fix ID of fix external instance
- **virial** [*real(c_double),dimension(6)*] :: the six global stress tensor components to be added to the global virial

Call to

`lammops_fix_external_set_virial_global()`

subroutine `fix_external_set_energy_peratom(id, eng)`

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to `set_fix_external_callback()` to set the per-atom energy contribution due to the fix from the external program as part of the callback function. For this to work, the LAMMPS object must be passed as part of the *caller* argument when registering the callback function, or the callback function must otherwise have access to the LAMMPS object, such as through a module-based pointer.

Note

This function is fully independent from `fix_external_set_energy_global()` and will **NOT** add any contributions to the global energy tally and will **NOT** check whether the sum of the contributions added here are consistent with the global added energy.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **id** [*character(len=*)*] :: fix ID of the fix external instance
- **eng** [*real(c_double),dimension(:)*] :: array of length *nlocal* containing the energy to add to the per-atom energy

Call to

`lammops_fix_external_set_energy_peratom()`

subroutine set_fix_external_set_virial_peratom(*id*, *virial*)

This is a companion function to [set_fix_external_callback\(\)](#) to set the per-atom virial contribution due to the fix from the external program as part of the callback function. For this to work, the LAMMPS object must be passed as the *caller* argument when registering the callback function.

Added in version 22Dec2022.

Note

This function is fully independent from [fix_external_set_virial_global\(\)](#) and will **NOT** add any contributions to the global virial tally and **NOT** check whether the sum of the contributions added here are consistent with the global added virial.

The order and units of the per-atom stress tensor elements are the same as for the global virial. The type and dimensions of the per-atom virial array must be `REAL(c_double)`, `DIMENSION(6,nlocal)`.

Please see the documentation for [fix external](#) for more information about how to use the fix and how to couple it with an external program.

Parameters

- **id** [*character(len=*)*] :: fix ID of fix external instance
- **virial** [*real(c_double),dimension(:,*)*] :: an array of $6 \times nlocal$ components to be added to the per-atom virial

Call to

`lammps_set_virial_peratom()`

subroutine fix_external_set_vector_length(*id*, *length*)

Set the vector length for a global vector stored with fix external for analysis.

Added in version 22Dec2022.

This is a companion function to [set_fix_external_callback\(\)](#) and [fix_external_get_force\(\)](#) to set the length of a global vector of properties that will be stored with the fix via [fix_external_set_vector\(\)](#).

This function needs to be called **before** a call to [fix_external_set_vector\(\)](#) and **before** a run or minimize command. When running in parallel, it must be called from **all** MPI processes with the same length argument.

Please see the documentation for [fix external](#) for more information about how to use the fix and how to couple it with an external program.

Parameters

- **id** [*character(len=*)*] :: fix ID of fix external instance
- **length** [*integer(c_int)*] :: length of the global vector to be stored with the fix

Call to

`lammps_fix_external_set_vector_length()`

subroutine fix_external_set_vector(*id*, *idx*, *val*)

Store a global vector value for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to `set_fix_external_callback()` and `fix_external_get_force()` to set the values of a global vector of properties that will be stored with the fix and can be accessed from within LAMMPS input commands (e.g., fix ave/time or variables) when used in a vector context.

This function needs to be called **after** a call to `fix_external_set_vector_length()` and **before** a run or minimize command. When running in parallel, it must be called from **all** MPI processes with the **same** `idx` and `val` parameters. The variable `val` is assumed to be extensive.

Note

The index in the `idx` parameter is 1-based (i.e., the first element is set with `idx = 1`, and the last element of the vector with `idx = N`, where `N` is the value of the `length` parameter of the call to `fix_external_set_vector_length()`).

Please see the documentation for `fix external` for more information about how to use the fix and how to couple it with an external code.

Parameters

- `id` [*character(len=*)*] :: ID of fix external instance
- `idx` [*integer(c_int)*] :: 1-based index in global vector
- `val` [*integer(c_int)*] :: value to be stored in global vector at index `idx`

Call to

`lammops_fix_external_set_vector()`

subroutine flush_buffers()

This function calls `lammops_flush_buffers()`, which flushes buffered output to be written to screen and logfile. This can simplify capturing output from LAMMPS library calls.

Added in version 3Nov2022.

Call to

`lammops_flush_buffers()`

function is_running()

Check if LAMMPS is currently inside a run or minimization.

Added in version 3Nov2022.

This function can be used from signal handlers or multi-threaded applications to determine if the LAMMPS instance is currently active.

Call to

`lammops_is_running()`

Return

`is_running` [*logical*] :: `.FALSE.` if idle or `.TRUE.` if active

subroutine force_timeout()

Force a timeout to stop an ongoing run cleanly.

Added in version 3Nov2022.

This function can be used from signal handlers or multi-threaded applications to terminate an ongoing run cleanly.

Call to

lammops_force_timeout()

function has_error()

Check if there is a (new) error message available.

Added in version 3Nov2022.

This function can be used to query if an error inside of LAMMPS has thrown a *C++ exception*.

Call to

lammops_has_error()

Return

has_error [*logical*] :: .TRUE. if there is an error.

subroutine get_last_error_message(buffer[, status])

Copy the last error message into the provided buffer.

Added in version 3Nov2022.

This function can be used to retrieve the error message that was set in the event of an error inside of LAMMPS that resulted in a *C++ exception*. A suitable buffer for a string has to be provided. If the internally-stored error message is longer than the string, it will be truncated accordingly. The optional argument *status* indicates the kind of error: a “1” indicates an error that occurred on all MPI ranks and is often recoverable, while a “2” indicates an abort that would happen only in a single MPI rank and thus may not be recoverable, as other MPI ranks may be waiting on the failing MPI rank(s) to send messages.

Parameters

buffer [*character(len=*)*] :: string buffer to copy the error message into

Options

status [*integer(c_int),optional*] :: 1 when all ranks had the error, 2 on a single-rank error.

Call to

lammops_get_last_error_message()

1.4 LAMMPS C++ API

It is also possible to invoke the LAMMPS C++ API directly in your code. It lacks some of the convenience of the C library API, but it allows more direct access to simulation data and thus more low-level manipulations. The following links provide some examples and references to the C++ API.

1.4.1 Using the C++ API directly

Using the C++ classes of the LAMMPS library is lacking some of the convenience of the C library API, but it allows a more direct access to simulation data and thus more low-level manipulations and tighter integration of LAMMPS into another code. While for the complete C library API is provided in the `library.h` header file, for using the C++ API it is required to include the individual header files defining the individual classes in use. Typically the name of the class and the name of the header follow some simple rule. Examples are given below.

1.4.2 Creating or deleting a LAMMPS object

When using the LAMMPS library interfaces, the core task is to create an instance of the `LAMMPS_NS::LAMMPS` class. In C++ this can be done directly through the `new` operator. All further operations are then initiated through calling member functions of some of the components of the LAMMPS class or accessing their data members. The destruction of the LAMMPS instance is correspondingly initiated by using the `delete` operator. Here is a simple example:

```
#include "lammops.h"

#include <mpi.h>
#include <iostream>

int main(int argc, char **argv)
{
    LAMMPS_NS::LAMMPS *lmp;
    // custom argument vector for LAMMPS library
    const char *lmpargv[] {"liblammops", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    // explicitly initialize MPI
    MPI_Init(&argc, &argv);

    // create LAMMPS instance
    lmp = new LAMMPS_NS::LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    // output numerical version string
    std::cout << "LAMMPS version ID: " << lmp->num_ver << std::endl;
    // delete LAMMPS instance
    delete lmp;

    // stop MPI environment
    MPI_Finalize();
    return 0;
}
```

This minimal example only requires to include the `lammops.h` header file since it only accesses a non-pointer member of the LAMMPS class.

1.4.3 Executing LAMMPS commands

Once a LAMMPS instance is created by your C++ code, you need to set up a simulation and that is most conveniently done by “driving” it through issuing commands like you would do when running a LAMMPS simulation from an input script. Processing of input in LAMMPS is handled by the `Input` class an instance of which is a member of the `LAMMPS` class. You have two options: reading commands from a file, or executing a single command from a string. See below for a small example:

```
#include "lammops.h"
#include "input.h"
#include <mpi.h>

using namespace LAMMPS_NS;

int main(int argc, char **argv)
{
    const char *lmpargv[] {"liblammops", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    MPI_Init(&argc, &argv);
    LAMMPS *lmp = new LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    lmp->input->file("in.melt");
    lmp->input->one("run 100 post no");
    delete lmp;
    return 0;
}
```

USE PYTHON WITH LAMMPS

These pages describe various ways that LAMMPS and Python can be used together.

2.1 Overview

The LAMMPS distribution includes a `python` directory with the Python code needed to run LAMMPS from Python. The `python/lammps` package contains *the “lammps” Python module* that wraps the LAMMPS C-library interface. This module makes it possible to do the following either from a Python script, or interactively from a Python prompt:

- create one or more instances of LAMMPS
- invoke LAMMPS commands or read them from an input script
- run LAMMPS incrementally
- extract LAMMPS results
- and modify internal LAMMPS data structures.

From a Python script you can do this in serial or in parallel. Running Python interactively in parallel does not generally work, unless you have a version of Python that extends Python to enable multiple instances of Python to read what you type.

To do all of this, you must build LAMMPS in *“shared” mode* and make certain that your Python interpreter can find the `lammps` Python package and the LAMMPS shared library file.

The Python wrapper for LAMMPS uses the `ctypes` package in Python, which auto-generates the interface code needed between Python and a set of C-style library functions. Ctypes has been part of the standard Python distribution since version 2.5. You can check which version of Python you have by simply typing “python” at a shell prompt. Below is an example output for Python version 3.8.5.

```
$ python
Python 3.8.5 (default, Aug 12 2020, 00:00:00)
[GCC 10.2.1 20200723 (Red Hat 10.2.1-1)] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

Warning

The options described in this section of the manual for using Python with LAMMPS support only Python 3.6 or later. For use with Python 2.x you will need to use an older LAMMPS version like 29 Aug 2024 or older. If you notice Python code in the LAMMPS distribution that is not compatible with Python 3, please contact the LAMMPS developers or submit [and issue on GitHub](#)

LAMMPS can work together with Python in two ways. First, Python can wrap LAMMPS through the its *library interface*, so that a Python script can create one or more instances of LAMMPS and launch one or more simulations. In Python terms, this is referred to as “extending” Python with a LAMMPS module.

Fig. 1: Launching LAMMPS via Python

Second, LAMMPS can use the Python interpreter, so that a LAMMPS input script or styles can invoke Python code directly, and pass information back-and-forth between the input script and Python functions you write. This Python code can also call back to LAMMPS to query or change its attributes through the LAMMPS Python module mentioned above. In Python terms, this is called “embedding” Python into LAMMPS. When used in this mode, Python can perform script operations that the simple LAMMPS input script syntax can not.

Fig. 2: Calling Python code from LAMMPS

2.2 Installation

The LAMMPS Python module enables calling the *LAMMPS C library API* from Python by dynamically loading functions in the LAMMPS shared library through the Python *ctypes* module. Because of the dynamic loading, it is required that LAMMPS is compiled in “*shared*” mode.

Changed in version 2Apr2025.

LAMMPS currently only supports Python version 3.6 or later.

Two components are necessary for Python to be able to invoke LAMMPS code:

- The LAMMPS Python Package (`lammops`) from the `python` folder

- The LAMMPS Shared Library (liblammeps.so, liblammeps.dylib or liblammeps.dll) from the folder where you compiled LAMMPS.

2.2.1 Installing the LAMMPS Python Module and Shared Library

Making LAMMPS usable within Python and vice versa requires putting the LAMMPS Python package (lammeps) into a location where the Python interpreter can find it and installing the LAMMPS shared library into a folder that the dynamic loader searches or inside of the installed lammeps package folder. There are multiple ways to achieve this.

1. Install both components into a Python `site-packages` folder, either system-wide or in the corresponding user-specific folder. This way no additional environment variables need to be set, but the shared library is otherwise not accessible.
2. Do an installation into a virtual environment.
3. Leave the files where they are in the source/development tree and adjust some environment variables.

Python package

Compile LAMMPS with either *CMake* or the *traditional make* procedure in *shared mode*. After compilation has finished, type (in the compilation folder):

```
make install-python
```

This will try to build a so-called (binary) wheel file, a compressed binary python package and then install it with the python package manager ‘pip’. Installation will be attempted into a system-wide `site-packages` folder and if that fails into the corresponding folder in the user’s home directory. For a system-wide installation you usually would have to gain superuser privilege first, e.g. though `sudo`

File	Location	Notes
LAMMPS Python package	• <code>\$HOME/.local/lib/pythonX.Y/site-packages/lammeps</code>	X.Y depends on the installed Python version
LAMMPS shared library	• <code>\$HOME/.local/lib/pythonX.Y/site-packages/lammeps</code>	X.Y depends on the installed Python version

For a system-wide installation those folders would then become.

File	Location	Notes
LAMMPS Python package	• <code>/usr/lib/pythonX.Y/site-packages/lammeps</code>	X.Y depends on the installed Python version
LAMMPS shared library	• <code>/usr/lib/pythonX.Y/site-packages/lammeps</code>	X.Y depends on the installed Python version

No environment variables need to be set for those, as those folders are searched by default by Python or the LAMMPS Python package.

Changed in version 24Mar2022.

Note

If there is an existing installation of the LAMMPS python module, `make install-python` will try to update it. However, that will fail if the older version of the module was installed by LAMMPS versions until 17Feb2022. Those were using the `distutils` package, which does not create a “manifest” that allows a clean uninstall. The `make install-python` command will always produce a `lammps-<version>-<python>-<abi>-<os>-<arch>.whl` file (the ‘wheel’). And this file can be later installed directly with `python -m pip install <wheel file>.whl` without having to type `make install-python` again and repeating the build step, too.

For the traditional `make` process you can override the python version to version `x.y` when calling `make` with `PYTHON=pythonX.Y`. For a CMake based compilation this choice has to be made during the CMake configuration step.

If the default settings of `make install-python` are not what you want, you can invoke `install.py` from the python directory manually as

```
python3 install.py -p <python package> -l <shared library> -v <version.h file> [-n] [-f]
```

- The `-p` flag argument is the full path to the python/lammps folder to be installed,
- the `-l` flag argument is the full path to the LAMMPS shared library file to be installed,
- the `-v` flag argument is the full path to the `src/version.h` file
- the optional `-n` flag instructs the script to only build a wheel file but not attempt to install it (default is to try installing),
- the optional `-w` flag argument is the path to a folder where to store the resulting wheel file (default is the current folder)
- and the optional `-f` argument instructs the script to force installation even if pip would otherwise refuse installation with an *error about externally managed environments*. The Python developers recommend to not augment a Python installation with custom packages, both at the user and the system level, and advise to use virtual environments instead. Some recent Linux distributions enforce that recommendation by default.

Example command line for building only the wheel after building LAMMPS with `cmake` in the folder `build`:

```
python3 python/install.py -n -p python/lammps -l build/liblammps.so -v src/
→version.h -w build
```

Virtual environment

A virtual environment is a minimal Python installation inside of a folder. It allows isolating and customizing a Python environment that is mostly independent from a user or system installation. For the core Python environment, it uses symbolic links to the system installation and thus it can be set up quickly and will not take up much disk space. This gives you the flexibility to install (newer/different) versions of Python packages that would potentially conflict with already installed system packages. It also does not require any superuser privileges. See [PEP 405: Python Virtual Environments](#) for more information.

To create a virtual environment in the folder `$HOME/myenv`, use the `venv` module as follows.

```
# create virtual environment in folder $HOME/myenv
python3 -m venv $HOME/myenv
```

To activate the virtual environment type:

```
source $HOME/myenv/bin/activate
```

This has to be done every time you log in or open a new terminal window and after you turn off the virtual environment with the `deactivate` command.

When using CMake to build LAMMPS, you need to set `CMAKE_INSTALL_PREFIX` to the value of the `$VIRTUAL_ENV` environment variable during the configuration step. For the traditional make procedure, no additional steps are needed. After compiling LAMMPS you can do a “Python package only” installation with `make install-python` and the LAMMPS Python package and the shared library file are installed into the following locations:

File	Location	Notes
LAMMPS Python Module	• <code>\$VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps</code>	X.Y depends on the installed Python version
LAMMPS shared library	• <code>\$VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps</code>	X.Y depends on the installed Python version

i In place usage

You can also *compile LAMMPS* as usual in “*shared*” mode leave the shared library and Python package inside the source/compilation folders. Instead of copying the files where they can be found, you need to set the environment variables `PYTHONPATH` (for the Python package) and `LD_LIBRARY_PATH` (or `DYLD_LIBRARY_PATH` on macOS

For Bourne shells (bash, ksh and similar) the commands are:

```
export PYTHONPATH=${PYTHONPATH}:${HOME}/lammps/python
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

For the C-shells like csh or tcsh the commands are:

```
setenv PYTHONPATH ${PYTHONPATH}:${HOME}/lammps/python
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

On macOS you may also need to set `DYLD_LIBRARY_PATH` accordingly. You can make those changes permanent by editing your `$HOME/.bashrc` or `$HOME/.login` files, respectively.

i Note

The `PYTHONPATH` needs to point to the parent folder that contains the `lammps` package!

In case you run into an “externally-managed-environment” error when trying to install the LAMMPS Python module, please refer to *corresponding paragraph* in the Python HOWTO page to learn about options for handling this error.

To verify if LAMMPS can be successfully started from Python, start the Python interpreter, load the `lammps` Python module and create a LAMMPS instance. This should not generate an error message and produce output similar to the following:

```
$ python
Python 3.8.5 (default, Sep  5 2020, 10:50:12)
[GCC 10.2.0] on linux
```

(continues on next page)

(continued from previous page)

```
Type "help", "copyright", "credits" or "license" for more information.
>>> import lammps
>>> lmp = lammps.lammps()
LAMMPS (18 Sep 2020)
using 1 OpenMP thread(s) per MPI task
>>>
```

Note

Unless you opted for “In place use”, you will have to rerun the installation any time you recompile LAMMPS to ensure the latest Python package and shared library are installed and used.

Note

If you want Python to be able to load different versions of the LAMMPS shared library with different settings, you will need to manually copy the files under different names (e.g. `liblammps_mpi.so` or `liblammps_gpu.so`) into the appropriate folder as indicated above. You can then select the desired library through the *name* argument of the LAMMPS object constructor (see [Creating or deleting a LAMMPS object](#)).

2.2.2 Extending Python to run in parallel

If you wish to run LAMMPS in parallel from Python, you need to extend your Python with an interface to MPI. This also allows you to make MPI calls directly from Python in your script, if you desire.

We have tested this with [MPI for Python](#) (aka `mpi4py`) and you will find installation instruction for it below.

Installation of `mpi4py` (version 4.0.1 as of Feb 2025) can be done as follows:

- Via `pip` into a local user folder with:

```
python3 -m pip install --user mpi4py
```

- Via `dnf` into a system folder for RedHat/Fedora systems:

```
# for use with OpenMPI
sudo dnf install python3-mpi4py-openmpi
# for use with MPICH
sudo dnf install python3-mpi4py-mpich
```

- Via `pip` into a virtual environment (see above):

```
$ source $HOME/myenv/activate
(myenv)$ python -m pip install mpi4py
```

- Via `pip` into a system folder (not recommended):

```
sudo python3 -m pip install mpi4py
```

For more detailed installation instructions and additional options, please see the [mpi4py installation](#) page.

To use `mpi4py` and LAMMPS in parallel from Python, you **must** make certain that **both** are using the **same** implementation and version of MPI library. If you only have one MPI library installed on your system this is not an issue, but it can be if you have multiple MPI installations (e.g. on an HPC cluster to be selected through environment modules).

Your LAMMPS build is explicit about which MPI it is using, since it is either detected during CMake configuration or in the traditional make build system you specify the details in your low-level `src/MAKE/Makefile.foo` file. The installation process of `mpi4py` uses the `mpicc` command to find information about the MPI it uses to build against. And it tries to load “`libmpi.so`” from the `LD_LIBRARY_PATH`. This may or may not find the MPI library that LAMMPS is using. If you have problems running both `mpi4py` and LAMMPS together, this is an issue you may need to address, e.g. by loading the module for different MPI installation so that `mpi4py` finds the right one.

If you have successfully installed `mpi4py`, you should be able to run Python and type

```
from mpi4py import MPI
```

without error. You should also be able to run Python in parallel on a simple test script

```
mpirun -np 4 python3 test.py
```

where `test.py` contains the lines

```
from mpi4py import MPI
comm = MPI.COMM_WORLD
print("Proc %d out of %d procs" % (comm.Get_rank(), comm.Get_size()))
```

and see one line of output for each processor you run on. Please note that the order of the lines is not deterministic

```
$ mpirun -np 4 python3 test.py
Proc 0 out of 4 procs
Proc 1 out of 4 procs
Proc 2 out of 4 procs
Proc 3 out of 4 procs
```

2.3 Run LAMMPS from Python

After compiling the LAMMPS shared library and making it ready to use, you can now write and run Python scripts that import the LAMMPS Python module and launch LAMMPS simulations through Python scripts. The following pages take you through the various steps necessary, what functionality is available and give some examples how to use it.

2.3.1 Running LAMMPS and Python in serial

To run a LAMMPS input in serial, type these lines into Python interactively from the `bench` directory:

```
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
```

Or put the same lines in the file `test.py` and run it as

```
python3 test.py
```

Either way, you should see the results of running the `in.lj` benchmark on a single processor appear on the screen, the same as if you had typed something like:

```
lmp_serial -in in.lj
```

2.3.2 Running LAMMPS and Python in parallel with MPI

To run LAMMPS in parallel, assuming you have installed the `mpi4py` package as discussed [Extending Python to run in parallel](#), create a `test.py` file containing these lines:

```
from mpi4py import MPI
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
me = MPI.COMM_WORLD.Get_rank()
nprocs = MPI.COMM_WORLD.Get_size()
print("Proc %d out of %d procs has" % (me,nprocs),lmp)
MPI.Finalize()
```

You can run the script in parallel as:

```
mpirun -np 4 python3 test.py
```

and you should see the same output as if you had typed

```
mpirun -np 4 lmp_mpi -in in.lj
```

Note that without the `mpi4py` specific lines from `test.py`

```
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
```

running the script with `mpirun` on P processors would lead to P independent simulations to run parallel, each with a single processor. Therefore, if you use the `mpi4py` lines and you see multiple LAMMPS single processor outputs, `mpi4py` is not working correctly.

Also note that once you import the `mpi4py` module, `mpi4py` initializes MPI for you, and you can use MPI calls directly in your Python script, as described in the `mpi4py` documentation. The last line of your Python script should be `MPI.finalize()`, to ensure MPI is shut down correctly.

2.3.3 Running Python scripts

Note that any Python script (not just for LAMMPS) can be invoked in one of several ways:

```
python script.py
python -i script.py
./script.py
```

The last command requires that the first line of the script be something like this:

```
#!/usr/bin/python
```

or

```
#!/usr/bin/env python
```

where the path in the first case needs to point to where you have Python installed (the second option is workaround for when this may change), and that you have made the script file executable:

```
chmod +x script.py
```

Without the `-i` flag, Python will exit when the script finishes. With the `-i` flag, you will be left in the Python interpreter when the script finishes, so you can type subsequent commands. As mentioned above, you can only run Python interactively when running Python on a single processor, not in parallel.

2.3.4 Creating or deleting a LAMMPS object

With the Python interface the creation of a *LAMMPS* instance is included in the constructor for the *lammps* class. Internally it will call either *lammps_open()* or *lammps_open_no_mpi()* from the C library API to create the class instance.

All arguments are optional. The *name* argument allows loading a LAMMPS shared library that is named *liblammps_machine.so* instead of the default name of *liblammps.so*. In most cases the latter will be installed or used. The *ptr* argument is for use of the *lammps* module from inside a LAMMPS instance, e.g. with the *python* command, where a pointer to the already existing *LAMMPS* class instance can be passed to the Python class and used instead of creating a new instance. The *comm* argument may be used in combination with the *mpi4py* module to pass an MPI communicator to LAMMPS and thus it is possible to run the Python module like the library interface on a subset of the MPI ranks after splitting the communicator.

Here is a simple example using the LAMMPS Python interface:

```
from lammps import lammps

# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]

# create LAMMPS instance
lmp = lammps(cmdargs=args)

# get and print numerical version code
print("LAMMPS Version: ", lmp.version())

# explicitly close and delete LAMMPS instance (optional)
lmp.close()
```

Same as with the *C library API*, this will use the *MPI_COMM_WORLD* communicator for the MPI library that LAMMPS was compiled with.

The *lmp.close()* call is optional since the LAMMPS class instance will also be deleted automatically during the *lammps* class destructor. Instead of *lmp.close()* it is also possible to call *lmp.finalize()*; this will destruct the LAMMPS instance, but also finalized and release the MPI and/or Kokkos environment if enabled and active.

Note that you can create multiple LAMMPS objects in your Python script, and coordinate and run multiple simulations, e.g.

```
from lammps import lammps
lmp1 = lammps()
lmp2 = lammps()
lmp1.file("in.file1")
lmp2.file("in.file2")
```

2.3.5 Executing commands

Once an instance of the `lammmps` class is created, there are multiple ways to “feed” it commands. In a way that is not very different from running a LAMMPS input script, except that Python has many more facilities for structured programming than the LAMMPS input script syntax. Furthermore it is possible to “compute” what the next LAMMPS command should be.

Same as in the equivalent *C library functions*, commands can be read from a file, a single string, a list of strings and a block of commands in a single multi-line string. They are processed under the same boundary conditions as the C library counterparts. The example below demonstrates the use of `lammmps.file()`, `lammmps.command()`, `lammmps.commands_list()`, and `lammmps.commands_string()`:

```
from lammmps import lammmps
lmp = lammmps()

# read commands from file 'in.melt'
lmp.file('in.melt')

# issue a single command
lmp.command('variable zpos index 1.0')

# create 10 groups with 10 atoms each
cmds = [f"group g{i} id {10*i+1}:{10*(i+1)}" for i in range(10)]
lmp.commands_list(cmds)

# run commands from a multi-line string
block = """
clear
region box block 0 2 0 2 0 2
create_box 1 box
create_atoms 1 single 1.0 1.0 ${zpos}
"""
lmp.commands_string(block)
```

For convenience, the `lammmps` class also provides a command wrapper `cmd` that turns any LAMMPS command into a regular function call.

For instance, the following LAMMPS command

```
region box block 0 10 0 5 -0.5 0.5
```

would normally be executed with the following Python code:

```
from lammmps import lammmps

lmp = lammmps()
lmp.command("region box block 0 10 0 5 -0.5 0.5")
```

With the `cmd` wrapper, any LAMMPS command can be split up into arbitrary parts. These parts are then passed to a member function with the name of the *command*. For the *region* command that means the `region()` method can be called. The arguments of the command can be passed as one string, or individually.

```
from lammmps import lammmps

L = lammmps()
```

(continues on next page)

(continued from previous page)

```
# pass command parameters as one string
L.cmd.region("box block 0 10 0 5 -0.5 0.5")

# OR pass them individually
L.cmd.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

In the latter example, all parameters except the first are Python floating-point literals. The member function takes the entire parameter list and transparently merges it to a single command string.

The benefit of this approach is avoiding redundant command calls and easier parameterization. With *command*, *commands_list*, and *commands_string* the parameterization needed to be done manually by creating formatted command strings.

```
lmp.command("region box block %f %f %f %f %f %f" % (xlo, xhi, ylo, yhi, zlo, zhi))
```

In contrast, methods of the *cmd* wrapper accept parameters directly and will convert them automatically to a final command string.

```
L.cmd.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

Note

When running in IPython you can use Tab-completion after `L.cmd.` to see all available LAMMPS commands.

Using these facilities, the previous example shown above can be rewritten as follows:

```
from lammps import lammps
L = lammps()

# read commands from file 'in.melt'
L.file('in.melt')

# issue a single command
L.cmd.variable('zpos', 'index', 1.0)

# create 10 groups with 10 atoms each
for i in range(10):
    L.cmd.group(f"g{i}", "id", f"{10*i+1}:{10*(i+1)}")

L.cmd.clear()
L.cmd.region("box block", 0, 2, 0, 2, 0, 2)
L.cmd.create_box(1, "box")
L.cmd.create_atoms(1, "single", 1.0, 1.0, "${zpos}")
```

2.3.6 System properties

Similar to what is described in *System properties*, the instances of *lammps* can be used to extract different kinds of information about the active LAMMPS instance and also to modify some of it.

In some cases the data returned is a direct reference to the original data inside LAMMPS cast to *ctypes* pointers. Where possible, the wrappers will determine the *ctypes* data type and cast pointers accordingly. If *numpy* is installed

arrays can also be extracted as numpy arrays, which will access the C arrays directly and have the correct dimensions to protect against invalid accesses.

Warning

When accessing per-atom data, please note that this data is the per-processor local data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between subdomains.

```
from lammps import lammps

lmp = lammps()
lmp.file("in.sysinit")

natoms = lmp.get_natoms()
print(f"running simulation with {natoms} atoms")

lmp.command("run 1000 post no");

for i in range(10):
    lmp.command("run 100 pre no post no")
    pe = lmp.get_thermo("pe")
    ke = lmp.get_thermo("ke")
    print(f"PE = {pe}\nKE = {ke}")

lmp.close()
```

Methods:

- `version()`: return the numerical version id, e.g. LAMMPS 2 Sep 2015 -> 20150902
- `get_thermo()`: return current value of a thermo keyword
- `last_thermo()`: return a dictionary of the last thermodynamic output
- `get_natoms()`: total # of atoms as int
- `reset_box()`: reset the simulation box size
- `extract_setting()`: return a global setting
- `extract_global()`: extract a global quantity
- `extract_box()`: extract box info
- `create_atoms()`: create N atoms with IDs, types, x, v, and image flags

Properties:

- `last_thermo_step`: the last timestep thermodynamic output was computed

2.3.7 Per-atom properties

Similar to what is described in *Per-atom properties*, the instances of `lammps` can be used to extract atom quantities and modify some of them.

In some cases the data returned is a direct reference to the original data inside LAMMPS cast to `ctypes` pointers. Where possible, the wrappers will determine the `ctypes` data type and cast pointers accordingly. If `numpy` is installed

arrays can also be extracted as numpy arrays, which will access the C arrays directly and have the correct dimensions to protect against invalid accesses.

Warning

When accessing per-atom data, please note that this data is the per-processor local data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between subdomains.

```
from lammps import lammps

lmp = lammps()
lmp.file("in.sysinit")

# Read/Write access via ctypes
nlocal = lmp.extract_global("nlocal")
x = lmp.extract_atom("x")

for i in range(nlocal):
    print("(x,y,z) = (" + x[i][0], x[i][1], x[i][2], ")")

# Read/Write access via NumPy arrays
atom_id = L.numpy.extract_atom("id")
atom_type = L.numpy.extract_atom("type")
x = L.numpy.extract_atom("x")
v = L.numpy.extract_atom("v")
f = L.numpy.extract_atom("f")

# set position in 2D simulation
x[0] = (1.0, 0.0)

# set position in 3D simulation
x[0] = (1.0, 0.0, 1.)

lmp.close()
```

Methods:

- `extract_atom()`: extract a per-atom quantity

Numpy Methods:

- `numpy.extract_atom()`: extract a per-atom quantity as numpy array

2.3.8 Compute, fixes, variables

This section documents accessing or modifying data from objects like computes, fixes, or variables in LAMMPS using the `lammps` module.

For `lammps.extract_compute()` and `lammps.extract_fix()`, the global, per-atom, or local data calculated by the compute or fix can be accessed. What is returned depends on whether the compute or fix calculates a scalar or vector or array. For a scalar, a single double value is returned. If the compute or fix calculates a vector or array, a pointer to the internal LAMMPS data is returned, which you can use via normal Python subscripting.

The one exception is that for a fix that calculates a global vector or array, a single double value from the vector or array is returned, indexed by I (vector) or I and J (array). I,J are zero-based indices. See the [Howto output](#) page for a discussion of global, per-atom, and local data, and of scalar, vector, and array data types. See the doc pages for individual [computes](#) and [fixes](#) for a description of what they calculate and store.

For `lammops.extract_variable()`, an *equal-style or atom-style variable* is evaluated and its result returned.

For equal-style variables a single `c_double` value is returned and the group argument is ignored. For atom-style variables, a vector of `c_double` is returned, one value per atom, which you can use via normal Python subscripting. The values will be zero for atoms not in the specified group.

`lammops.numpy.extract_compute()`, `lammops.numpy.extract_fix()`, and `lammops.numpy.extract_variable()` are equivalent NumPy implementations that return NumPy arrays instead of ctypes pointers.

The `lammops.set_variable()` method sets an existing string-style variable to a new string value, so that subsequent LAMMPS commands can access the variable.

Methods:

- `lammops.extract_compute()`: extract value(s) from a compute
- `lammops.extract_fix()`: extract value(s) from a fix
- `lammops.extract_variable()`: extract value(s) from a variable
- `lammops.set_variable()`: set existing named string-style variable to value

NumPy Methods:

- `lammops.numpy.extract_compute()`: extract value(s) from a compute, return arrays as numpy arrays
- `lammops.numpy.extract_fix()`: extract value(s) from a fix, return arrays as numpy arrays
- `lammops.numpy.extract_variable()`: extract value(s) from a variable, return arrays as numpy arrays

2.3.9 Scatter/gather operations

```
data = lmp.gather_atoms(name,dtype,count)  # return per-atom property of all atoms_
↳gathered into data, ordered by atom ID
                                     # name = "x", "q", "type", etc
data = lmp.gather_atoms_concat(name,dtype,count)  # ditto, but concatenated atom values_
↳from each proc (unordered)
data = lmp.gather_atoms_subset(name,dtype,count,ndata,ids)  # ditto, but for subset of_
↳Ndata atoms with IDs

lmp.scatter_atoms(name,dtype,count,data)  # scatter per-atom property to all atoms from_
↳data, ordered by atom ID
                                     # name = "x", "q", "type", etc
                                     # count = # of per-atom values, 1 or 3, etc
lmp.scatter_atoms_subset(name,dtype,count,ndata,ids,data)  # ditto, but for subset of_
↳Ndata atoms with IDs
```

The gather methods collect peratom info of the requested type (atom coords, atom types, forces, etc) from all processors, and returns the same vector of values to each calling processor. The scatter functions do the inverse. They distribute a vector of peratom values, passed by all calling processors, to individual atoms, which may be owned by different processors.

The `dtype` parameter is 0 for `int` values and 1 for `double` values. The `count` parameter is 1 for per-atom vectors like “type” or “q” and 3 for per-atom arrays like “x”, “v”, “f”. Use `count = 3` with `name = “image”` if you want the single integer storing the image flags unpacked into 3 components (“x”, “y”, and “z”).

Note that the data returned by the gather methods, e.g. `gather_atoms("x")`, is different from the data structure returned by `extract_atom("x")` in four ways. (1) `gather_atoms()` returns a vector which you index as `x[i]`; `extract_atom()` returns an array which you index as `x[i][j]`. (2) `gather_atoms()` orders the atoms by atom ID while `extract_atom()` does not. (3) `gather_atoms()` returns a list of all atoms in the simulation; `extract_atoms()` returns just the atoms local to each processor. (4) Finally, the `gather_atoms()` data structure is a copy of the atom coords stored internally in LAMMPS, whereas `extract_atom()` returns an array that effectively points directly to the internal data. This means you can change values inside LAMMPS from Python by assigning a new values to the `extract_atom()` array. To do this with the `gather_atoms()` vector, you need to change values in the vector, then invoke the `scatter_atoms("x")` method.

For the scatter methods, the array of coordinates passed to must be a ctypes vector of ints or doubles, allocated and initialized something like this:

```
from ctypes import c_double
natoms = lmp.get_natoms()
n3 = 3*natoms
x = (n3*c_double)()
x[0] = x coord of atom with ID 1
x[1] = y coord of atom with ID 1
x[2] = z coord of atom with ID 1
x[3] = x coord of atom with ID 2
...
x[n3-1] = z coord of atom with ID natoms
lmp.scatter_atoms("x", 1, 3, x)
```

The coordinates can also be provided as arguments to the initializer of `x`:

```
from ctypes import c_double
natoms = 2
n3 = 3*natoms
# init in constructor
x = (n3*c_double)(0.0, 0.0, 0.0, 1.0, 1.0, 1.0)
lmp.scatter_atoms("x", 1, 3, x)
# or using a list
coords = [1.0, 2.0, 3.0, -3.0, -2.0, -1.0]
x = (c_double*len(coords))(*coords)
```

Alternatively, you can just change values in the vector returned by the gather methods, since they are also ctypes vectors.

2.3.10 Neighbor list access

Access to neighbor lists is handled through a couple of wrapper classes that allows one to treat it like either a python list or a NumPy array. The access procedure is similar to that of the C-library interface: use one of the “find” functions to look up the index of the neighbor list in the global table of neighbor lists and then get access to the neighbor list data. The code sample below demonstrates reading the neighbor list data using the NumPy access method.

```
from lammps import lammps
import numpy as np

lmp = lammps()
lmp.commands_string("""
```

(continues on next page)

(continued from previous page)

```

region box block -2 2 -2 2 -2 2
lattice fcc 1.0
create_box 1 box
create_atoms 1 box
mass 1 1.0
pair_style lj/cut 2.5
pair_coeff 1 1 1.0 1.0
run 0 post no""")

# look up the neighbor list
nlist = lmp.find_pair_neighlist('lj/cut')
nl = lmp.numpy.get_neighlist(nlist)
tags = lmp.extract_atom('id')
print("half neighbor list with {} entries".format(nl.size))
# print neighbor list contents
for i in range(0,nl.size):
    idx, nlist = nl.get(i)
    print("\natom {} with ID {} has {} neighbors:".format(idx,tags[idx],nlist.size))
    if nlist.size > 0:
        for n in np.nditer(nlist):
            print("  atom {} with ID {}".format(n,tags[n]))

```

Another example for extracting a full neighbor list without evaluating a potential is shown below.

```

from lammps import lammps
import numpy as np

lmp = lammps()
lmp.commands_string("""
newton off
region box block -2 2 -2 2 -2 2
lattice fcc 1.0
create_box 1 box
create_atoms 1 box
mass 1 1.0
pair_style zero 1.0 full
pair_coeff * *
run 0 post no""")

# look up the neighbor list
nlist = lmp.find_pair_neighlist('zero')
nl = lmp.numpy.get_neighlist(nlist)
tags = lmp.extract_atom('id')
print("full neighbor list with {} entries".format(nl.size))
# print neighbor list contents
for i in range(0,nl.size):
    idx, nlist = nl.get(i)
    print("\natom {} with ID {} has {} neighbors:".format(idx,tags[idx],nlist.size))
    if nlist.size > 0:
        for n in np.nditer(nlist):
            pass
            print("  atom {} with ID {}".format(n,tags[n]))

```

Methods:

- `lammops.get_neighlist()`: Get neighbor list for given index
- `lammops.get_neighlist_size()`: Get number of elements in neighbor list
- `lammops.get_neighlist_element_neighbors()`: Get element in neighbor list and its neighbors
- `lammops.find_pair_neighlist()`: Find neighbor list of pair style
- `lammops.find_fix_neighlist()`: Find neighbor list of fix style
- `lammops.find_compute_neighlist()`: Find neighbor list of compute style

NumPy Methods:

- `lammops.numpy.get_neighlist()`: Get neighbor list for given index, which uses NumPy arrays for its element neighbor arrays
- `lammops.numpy.get_neighlist_element_neighbors()`: Get element in neighbor list and its neighbors (as a numpy array)

2.3.11 Configuration information

The following methods can be used to query the LAMMPS library about compile time settings and included packages and styles.

Listing 1: Example for using configuration settings functions

```
from lammops import lammops

lmp = lammops()

try:
    lmp.file("in.missing")
except Exception as e:
    print("LAMMPS failed with error:", e)

# write compressed dump file depending on available of options

if lmp.has_style("dump", "atom/zstd"):
    lmp.command("dump d1 all atom/zstd 100 dump.zst")
elif lmp.has_style("dump", "atom/gz"):
    lmp.command("dump d1 all atom/gz 100 dump.gz")
elif lmp.has_gzip_support():
    lmp.command("dump d1 all atom 100 dump.gz")
else:
    lmp.command("dump d1 all atom 100 dump")
```

Methods:

- `lammops.has_mpi_support`
- `lammops.has_exceptions`
- `lammops.has_gzip_support`
- `lammops.has_png_support`
- `lammops.has_jpeg_support`

- `lammps.has_ffmpeg_support`
- `lammps.installed_packages`
- `lammps.get_accelerator_config`
- `lammps.has_style()`
- `lammps.available_styles()`

2.4 The `lammps` Python module

The LAMMPS Python interface is implemented as a module called `lammps` which is defined in the `lammps` package in the `python` folder of the LAMMPS source code distribution. After compilation of LAMMPS, the module can be installed into a Python system folder or a user folder with `make install-python`. Components of the module can then be loaded into a Python session with the `import` command.

Warning

Alternative interfaces such as `PyLammps` and `IPyLammps` classes have been deprecated and will be removed in a future version of LAMMPS.

Version check

The `lammps` module stores the version number of the LAMMPS version it is installed from. When initializing the `lammps` class, this version is checked to be the same as the result from `lammps.version()`, the version of the LAMMPS shared library that the module interfaces to. If they are not the same an `AttributeError` exception is raised since a mismatch of versions (e.g. due to incorrect use of the `LD_LIBRARY_PATH` or `PYTHONPATH` environment variables) can lead to crashes or data corruption and otherwise incorrect behavior.

LAMMPS module global members:

`lammps.__version__`

Numerical representation of the LAMMPS version this module was taken from. Has the same format as the result of `lammps.version()`.

`lammps.get_version_number()`

Extract LAMMPS version string and convert to number

2.4.1 The `lammps` class API

The `lammps` class is the core of the LAMMPS Python interface. It is a wrapper around the *LAMMPS C library API* using the `Python ctypes module` and a shared library compiled from the LAMMPS sources code. The individual methods in this class try to closely follow the corresponding C functions. The handle argument that needs to be passed to the C functions is stored internally in the class and automatically added when calling the C library functions. Below is a detailed documentation of the API.

class `lammps.lammps(name="", cmdargs=None, ptr=None, comm=None)`

Create an instance of the LAMMPS Python class.

This is a Python wrapper class that exposes the LAMMPS C-library interface to Python. It either requires that LAMMPS has been compiled as shared library which is then dynamically loaded via the `ctypes` Python module or that this module is called from a Python function that is called from a Python interpreter embedded into a

LAMMPS executable, for example through the *python invoke* command. When the class is instantiated it calls the *lammps_open()* function of the LAMMPS C-library interface, which in turn will create an instance of the *LAMMPS* C++ class. The handle to this C++ class is stored internally and automatically passed to the calls to the C library interface.

Parameters

- **name** (*string*) – “machine” name of the shared LAMMPS library (“mpi” loads liblammps_mpi.so, “” loads liblammps.so)
- **cmdargs** (*list*) – list of command line arguments to be passed to the *lammps_open()* function. The executable name is automatically added.
- **ptr** (*pointer*) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- **comm** (*MPI_Comm*) – MPI communicator (as provided by *mpi4py*). None means use MPI_COMM_WORLD implicitly.

property numpy

Return object to access numpy versions of API

It provides alternative implementations of API functions that return numpy arrays instead of ctypes pointers. If numpy is not installed, accessing this property will lead to an ImportError.

Returns

instance of numpy wrapper object

Return type

numpy_wrapper

property cmd

Return object that acts as LAMMPS command wrapper

It provides alternative to *lammps.command()* to call LAMMPS commands as if they were regular Python functions and enables auto-complete in interactive Python sessions.

```
from lammps import lammps

# melt example
L = lammps()
L.cmd.units("lj")
L.cmd.atom_style("atomic")
L.cmd.lattice("fcc", 0.8442)
L.cmd.region("box block", 0, 10, 0, 10, 0, 10)
L.cmd.create_box(1, "box")
L.cmd.create_atoms(1, "box")
L.cmd.mass(1, 1.0)
L.cmd.velocity("all create", 3.0, 87287, "loop geom")
L.cmd.pair_style("lj/cut", 2.5)
L.cmd.pair_coeff(1, 1, 1.0, 1.0, 2.5)
L.cmd.neighbor(0.3, "bin")
L.cmd.neigh_modify(every=20, delay=0, check=False)
L.cmd.fix(1, "all nve")
L.cmd.thermo(50)
L.cmd.run(250)
```

Returns

instance of command_wrapper object

Return type

command_wrapper

property ipython

Return object to access ipython extensions

Adds commands for visualization in IPython and Jupyter Notebooks.

Returns

instance of ipython wrapper object

Return type*ipython.wrapper***close()**

Explicitly delete a LAMMPS instance through the C-library interface.

This is a wrapper around the *lammps_close()* function of the C-library interface.**finalize()**

Shut down the MPI communication and Kokkos environment (if active) through the library interface by calling *lammps_mpi_finalize()*, *lammps_kokkos_finalize()*, *lammps_python_finalize()*, and *lammps_plugin_finalize()*

You cannot create or use any LAMMPS instances after this function is called unless LAMMPS was compiled without MPI and without Kokkos support.

error(error_type, error_text)

Forward error to the LAMMPS Error class.

Added in version 3Nov2022.

This is a wrapper around the *lammps_error()* function of the C-library interface.**Parameters**

- **error_type** (*int*)
- **error_text** (*string*)

version()

Return a numerical representation of the LAMMPS version in use.

This is a wrapper around the *lammps_version()* function of the C-library interface.**Returns**

version number

Return type

int

get_os_info()

Return a string with information about the OS and compiler runtime

This is a wrapper around the *lammps_get_os_info()* function of the C-library interface.**Returns**

OS info string

Return type

string

get_mpi_comm()

Get the MPI communicator in use by the current LAMMPS instance

This is a wrapper around the [`lammps\_get\_mpi\_comm\(\)`](#) function of the C-library interface. It will return `None` if either the LAMMPS library was compiled without MPI support or the `mpi4py` Python module is not available.

Returns

MPI communicator

Return type

MPI_Comm

expand(*line*)

Expand a single LAMMPS string like an input line

This is a wrapper around the [`lammps\_expand\(\)`](#) function of the C-library interface.

Parameters

cmd (*string*) – a single lammps line

Returns

expanded string

Return type

string

file(*path*)

Read LAMMPS commands from a file.

This is a wrapper around the [`lammps\_file\(\)`](#) function of the C-library interface. It will open the file with the name/path *file* and process the LAMMPS commands line by line until the end. The function will return when the end of the file is reached.

Parameters

path (*string*) – Name of the file/path with LAMMPS commands

command(*cmd*)

Process a single LAMMPS input command from a string.

This is a wrapper around the [`lammps\_command\(\)`](#) function of the C-library interface.

Parameters

cmd (*string*) – a single lammps command

commands_list(*cmdlist*)

Process multiple LAMMPS input commands from a list of strings.

This is a wrapper around the [`lammps\_commands\_list\(\)`](#) function of the C-library interface.

Parameters

cmdlist (*list of strings*) – a single lammps command

commands_string(*multicmd*)

Process a block of LAMMPS input commands from a string.

This is a wrapper around the [`lammps\_commands\_string\(\)`](#) function of the C-library interface.

Parameters

multicmd (*string*) – text block of lammps commands

get_natoms()

Get the total number of atoms in the LAMMPS instance.

Will be precise up to 53-bit signed integer due to the underlying `lammops_get_natoms()` function returning a double.

Returns

number of atoms

Return type

int

extract_box()

Extract simulation box parameters

This is a wrapper around the `lammops_extract_box()` function of the C-library interface. Unlike in the C function, the result is returned as a list.

Returns

list of the extracted data: boxlo, boxhi, xy, yz, xz, periodicity, box_change

Return type

[3*double, 3*double, double, double, 3*int, int]

reset_box(boxlo, boxhi, xy, yz, xz)

Reset simulation box parameters

This is a wrapper around the `lammops_reset_box()` function of the C-library interface.

Parameters

- **boxlo** (*list of 3 floating point numbers*) – new lower box boundaries
- **boxhi** (*list of 3 floating point numbers*) – new upper box boundaries
- **xy** (*float*) – xy tilt factor
- **yz** (*float*) – yz tilt factor
- **xz** (*float*) – xz tilt factor

get_thermo(name)

Get current value of a thermo keyword

This is a wrapper around the `lammops_get_thermo()` function of the C-library interface.

Parameters

name (*string*) – name of thermo keyword

Returns

value of thermo keyword

Return type

double or None

property last_thermo_step

Get the last timestep where thermodynamic data was computed

Returns

the timestep or a negative number if there has not been any thermo output yet

Return type

int

last_thermo()

Get a dictionary of the last thermodynamic output

This is a wrapper around the `lammps_last_thermo()` function of the C-library interface. It collects the cached thermo data from the last timestep into a dictionary. The return value is None, if there has not been any thermo output yet.

Returns

a dictionary containing the last computed thermo output values

Return type

dict or None

extract_setting(name)

Query LAMMPS about global settings that can be expressed as an integer.

This is a wrapper around the `lammps_extract_setting()` function of the C-library interface. Its documentation includes a list of the supported keywords.

Parameters

name (*string*) – name of the setting

Returns

value of the setting

Return type

int

extract_global_datatype(name)

Retrieve global property datatype from LAMMPS

This is a wrapper around the `lammps_extract_global_datatype()` function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns None if the keyword is not recognized. Otherwise it will return a positive integer value that corresponds to one of the *data type* constants defined in the `lammps` module.

Parameters

name (*string*) – name of the property

Returns

data type of global property, see *Data Types*

Return type

int

extract_global(name, dtype=None)

Query LAMMPS about global settings of different types.

This is a wrapper around the `lammps_extract_global()` function of the C-library interface. Since there are no pointers in Python, this method will - unlike the C function - return the value or a list of values. The `lammps_extract_global()` documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type. For that purpose the `lammps` module contains *data type* constants. This function returns None if either the keyword is not recognized, or an invalid data type constant is used.

Parameters

- **name** (*string*) – name of the property
- **dtype** (*int*, *optional*) – data type of the returned data (see *Data Types*)

Returns

value of the property or list of values or None

Return type

int, float, list, or NoneType

extract_pair_dimension(*name*)

Retrieve pair style property dimensionality from LAMMPS

Added in version 29Aug2024.

This is a wrapper around the `lammops_extract_pair_dimension()` function of the C-library interface. The list of supported keywords depends on the pair style. This function returns None if the keyword is not recognized.

Parameters

name (*string*) – name of the property

Returns

dimensionality of the extractable data (typically 0, 1, or 2)

Return type

int

extract_pair(*name*)

Extract pair style data from LAMMPS.

Added in version 29Aug2024.

This is a wrapper around the `lammops_extract_pair()` function of the C-library interface. Since there are no pointers in Python, this method will - unlike the C function - return the value or a list of values. Since Python needs to know the dimensionality to be able to interpret the result, this function will detect the dimensionality by asking the library. This function returns None if the keyword is not recognized.

Parameters

name (*string*) – name of the property

Returns

value of the property or list of values or None

Return type

float, list of float, list of list of floats, or NoneType

map_atom(*atomid*)

Map a global atom ID (aka tag) to the local atom index

This is a wrapper around the `lammops_map_atom()` function of the C-library interface.

Parameters

atomid (*int*) – atom ID

Returns

local index

Return type

int

extract_atom_datatype(*name*)

Retrieve per-atom property datatype from LAMMPS

This is a wrapper around the `lammops_extract_atom_datatype()` function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns None if the keyword is

not recognized. Otherwise it will return an integer value that corresponds to one of the *data type* constants defined in the *lammps* module.

Parameters

name (*string*) – name of the property

Returns

data type of per-atom property (see *Data Types*)

Return type

int

extract_atom_size(*name*, *dtype*)

Retrieve per-atom property dimensions from LAMMPS

This is a wrapper around the *lammps_extract_atom_size()* function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns *None* if the keyword is not recognized. Otherwise it will return an integer value with the size of the per-atom vector or array. If *name* corresponds to a per-atom array, the *dtype* keyword must be either *LMP_SIZE_ROWS* or *LMP_SIZE_COLS* from the *type* constants defined in the *lammps* module. The return value is the requested size. If *name* corresponds to a per-atom vector the *dtype* keyword is ignored.

Parameters

- **name** (*string*) – name of the property
- **type** (*int*) – either *LMP_SIZE_ROWS* or *LMP_SIZE_COLS* for arrays, otherwise ignored

Returns

data type of per-atom property (see *Data Types*)

Return type

int

extract_atom(*name*, *dtype=None*)

Retrieve per-atom properties from LAMMPS

This is a wrapper around the *lammps_extract_atom()* function of the C-library interface. Its documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type by setting *dtype* to one of the *data type* constants defined in the *lammps* module. This function returns *None* if either the keyword is not recognized, or an invalid data type constant is used.

Note

While the returned vectors or arrays of per-atom data are dimensioned for the range [0:nmax] - as is the underlying storage - the data is usually only valid for the range of [0:nlocal], unless the property of interest is also updated for ghost atoms. In some cases, this depends on a LAMMPS setting, see for example *comm_modify vel yes*. The actual size can be determined by calling *py:meth:extract_atom_size()* *<lammps.lammps.extract_atom_size>*.

Parameters

- **name** (*string*) – name of the property
- **dtype** (*int*, *optional*) – data type of the returned data (see *Data Types*)

Returns

requested data or None

Return type

ctypes.POINTER(ctypes.c_int32), ctypes.POINTER(ctypes.POINTER(ctypes.c_int32)),
ctypes.POINTER(ctypes.c_int64), ctypes.POINTER(ctypes.POINTER(ctypes.c_int64)),
ctypes.POINTER(ctypes.c_double), ctypes.POINTER(ctypes.POINTER(ctypes.c_double)),
or NoneType

extract_compute(*cid*, *cstyle*, *ctype*)

Retrieve data from a LAMMPS compute

This is a wrapper around the `lammops_extract_compute()` function of the C-library interface. This function returns None if either the compute id is not recognized, or an invalid combination of *cstyle* and *ctype* constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, otherwise a pointer.

Parameters

- **cid** (*string*) – compute ID
- **cstyle** (*int*) – style of the data retrieve (global, atom, or local), see [Style Constants](#)
- **ctype** (*int*) – type or size of the returned data (scalar, vector, or array), see [Type Constants](#)

Returns

requested data as scalar, pointer to 1d or 2d double array, or None

Return type

c_double, ctypes.POINTER(c_double), ctypes.POINTER(ctypes.POINTER(c_double)), or
NoneType

extract_fix(*fid*, *fstyle*, *ftype*, *nrow*=0, *ncol*=0)

Retrieve data from a LAMMPS fix

This is a wrapper around the `lammops_extract_fix()` function of the C-library interface. This function returns None if either the fix id is not recognized, or an invalid combination of *fstyle* and *ftype* constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, also when accessing global vectors or arrays, otherwise a pointer.

Note

When requesting global data, the fix data can only be accessed one item at a time without access to the whole vector or array. Thus this function will always return a scalar. To access vector or array elements the “nrow” and “ncol” arguments need to be set accordingly (they default to 0).

Parameters

- **fid** (*string*) – fix ID
- **fstyle** (*int*) – style of the data retrieve (global, atom, or local), see [Style Constants](#)
- **ftype** (*int*) – type or size of the returned data (scalar, vector, or array), see [Type Constants](#)
- **nrow** (*int*) – index of global vector element or row index of global array element
- **ncol** (*int*) – column index of global array element

Returns

requested data or None

Return type

c_double, ctypes.POINTER(c_double), ctypes.POINTER(ctypes.POINTER(c_double)), or
NoneType

extract_variable(*name*, *group=None*, *vartype=None*)

Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function `lammops_extract_variable()` of the C library interface, evaluates variable name and returns a copy of the computed data. The memory temporarily allocated by the C-interface is deleted after the data is copied to a Python variable or list. The variable must be either an equal-style (or equivalent) variable or an atom-style variable. The variable type can be provided as the *vartype* parameter, which may be one of several constants: `LMP_VAR_EQUAL`, `LMP_VAR_ATOM`, `LMP_VAR_VECTOR`, or `LMP_VAR_STRING`. If omitted or `None`, LAMMPS will determine its value for you based on a call to `lammops_extract_variable_datatype()` from the C library interface. The *group* parameter is only used for atom-style variables and defaults to the group “all”.

Parameters

- **name** (*string*) – name of the variable to execute
- **group** (*string, only for atom-style variables*) – name of group for atom-style variable
- **vartype** (*int*) – type of variable, see *Variable Type Constants*

Returns

the requested data

Return type

c_double, (c_double), or NoneType

clearstep_compute()

Call ‘lammops_clearstep_compute()’ from Python

addstep_compute(*nextstep*)

Call ‘lammops_addstep_compute()’ from Python

addstep_compute_all(*nextstep*)

Call ‘lammops_addstep_compute_all()’ from Python

flush_buffers()

Flush output buffers

This is a wrapper around the `lammops_flush_buffers()` function of the C-library interface.

set_variable(*name*, *value*)

Set a new value for a LAMMPS string style variable

Deprecated since version 7Feb2024.

This is a wrapper around the `lammops_set_variable()` function of the C-library interface.

Parameters

- **name** (*string*) – name of the variable
- **value** (*any. will be converted to a string*) – new variable value

Returns

either 0 on success or -1 on failure

Return type

int

set_string_variable(*name*, *value*)

Set a new value for a LAMMPS string style variable

Added in version 7Feb2024.

This is a wrapper around the `lammps_set_string_variable()` function of the C-library interface.

Parameters

- **name** (*string*) – name of the variable
- **value** (*any. will be converted to a string*) – new variable value

Returns

either 0 on success or -1 on failure

Return type

int

set_internal_variable(*name*, *value*)

Set a new value for a LAMMPS internal style variable

Added in version 7Feb2024.

This is a wrapper around the `lammps_set_internal_variable()` function of the C-library interface.

Parameters

- **name** (*string*) – name of the variable
- **value** (*float or compatible. will be converted to float*) – new variable value

Returns

either 0 on success or -1 on failure

Return type

int

eval(*expr*)

Evaluate a LAMMPS immediate variable expression

Added in version 4Feb2025.

This function is a wrapper around the function `lammps_eval()` of the C library interface. It evaluates and expression like in immediate variables and returns the value.

Parameters

expr – immediate variable expression

Returns

the result of the evaluation

Return type

c_double

gather_bonds()

Retrieve global list of bonds

Added in version 28Jul2021.

This is a wrapper around the `lammps_gather_bonds()` function of the C-library interface.

This function returns a tuple with the number of bonds and a flat list of ctypes integer values with the bond type, bond atom1, bond atom2 for each bond.

Returns

a tuple with the number of bonds and a list of c_int or c_long

Return type

(int, 3*nbonds*c_tagint)

gather_angles()

Retrieve global list of angles

Added in version 8Feb2023.

This is a wrapper around the [lammps_gather_angles\(\)](#) function of the C-library interface.

This function returns a tuple with the number of angles and a flat list of ctypes integer values with the angle type, angle atom1, angle atom2, angle atom3 for each angle.

Returns

a tuple with the number of angles and a list of c_int or c_long

Return type

(int, 4*nangles*c_tagint)

gather_dihedrals()

Retrieve global list of dihedrals

Added in version 8Feb2023.

This is a wrapper around the [lammps_gather_dihedrals\(\)](#) function of the C-library interface.

This function returns a tuple with the number of dihedrals and a flat list of ctypes integer values with the dihedral type, dihedral atom1, dihedral atom2, dihedral atom3, dihedral atom4 for each dihedral.

Returns

a tuple with the number of dihedrals and a list of c_int or c_long

Return type

(int, 5*ndihedrals*c_tagint)

gather_impropers()

Retrieve global list of impropers

Added in version 8Feb2023.

This is a wrapper around the [lammps_gather_impropers\(\)](#) function of the C-library interface.

This function returns a tuple with the number of impropers and a flat list of ctypes integer values with the improper type, improper atom1, improper atom2, improper atom3, improper atom4 for each improper.

Returns

a tuple with the number of impropers and a list of c_int or c_long

Return type

(int, 5*nimpropers*c_tagint)

encode_image_flags(ix, iy, iz)

convert 3 integers with image flags for x-, y-, and z-direction into a single integer like it is used internally in LAMMPS

This method is a wrapper around the [lammps_encode_image_flags\(\)](#) function of library interface.

Parameters

- **ix** (*int*) – x-direction image flag
- **iy** (*int*) – y-direction image flag
- **iz** (*int*) – z-direction image flag

Returns

encoded image flags

Return type

`lammps.c_imageint`

decode_image_flags(*image*)

Convert encoded image flag integer into list of three regular integers.

This method is a wrapper around the [`lammps\_decode\_image\_flags\(\)`](#) function of library interface.

Parameters

image (*lammps.c_imageint*) – encoded image flags

Returns

list of three image flags in x-, y-, and z- direction

Return type

list of 3 int

create_atoms(*n, atomid, atype, x, v=None, image=None, shrinkexceed=False*)

Create N atoms from list of coordinates and properties

This function is a wrapper around the [`lammps\_create\_atoms\(\)`](#) function of the C-library interface, and the behavior is similar except that the *v*, *image*, and *shrinkexceed* arguments are optional and default to *None*, *None*, and *False*, respectively. With *None* being equivalent to a NULL pointer in C.

The lists of coordinates, types, atom IDs, velocities, image flags can be provided in any format that may be converted into the required internal data types. Also the list may contain more than *N* entries, but not fewer. In the latter case, the function will return without attempting to create atoms. You may use the [`encode\_image\_flags`](#) method to properly combine three integers with image flags into a single integer.

Parameters

- **n** (*int*) – number of atoms for which data is provided
- **atomid** (*list of lammps.tagint*) – list of atom IDs with at least n elements or None
- **atype** (*list of int*) – list of atom types
- **x** (*list of float*) – list of coordinates for x-, y-, and z (flat list of 3n entries)
- **v** (*list of float*) – list of velocities for x-, y-, and z (flat list of 3n entries) or None (optional)
- **image** (*list of lammps.imageint*) – list of encoded image flags (optional)
- **shrinkexceed** (*bool*) – whether to expand shrink-wrap boundaries if atoms are outside the box (optional)

Returns

number of atoms created. 0 if insufficient or invalid data

Return type

int

create_molecule(*molid*, *jsonstr*)

Create new molecule template from string with JSON data

Added in version 22Jul2025.

This is a wrapper around the `lammops_create_molecule()` function of the library interface.

Parameters

- **molid** – molecule-id of the new molecule template
- **jsonstr** (*string*) – JSON data defining a new molecule template

property has_mpi_support

Report whether the LAMMPS shared library was compiled with a real MPI library or in serial.

This is a wrapper around the `lammops_config_has_mpi_support()` function of the library interface.

Returns

False when compiled with MPI STUBS, otherwise True

Return type

bool

property has_omp_support

Report whether the LAMMPS shared library was compiled with OpenMP enabled.

This is a wrapper around the `lammops_config_has_omp_support()` function of the library interface.

Returns

True when compiled with OpenMP enabled, otherwise False

Return type

bool

property is_running

Report whether being called from a function during a run or a minimization

Added in version 9Oct2020.

Various LAMMPS commands must not be called during an ongoing run or minimization. This property allows to check for that. This is a wrapper around the `lammops_is_running()` function of the library interface.

Returns

True when called during a run otherwise false

Return type

bool

set_show_error(*flag*)

Enable or disable direct printing of error messages in C++ code

Added in version 2Apr2025.

This function allows to enable or disable printing of error message directly in the C++ code. Disabling the printing avoids printing error messages twice when detecting and re-throwing them in Python code.

This is a wrapper around the `lammops_set_show_error()` function of the library interface.

Parameters

flag (*int*) – enable (1) or disable (0) printing of error message

Returns

previous setting of the flag

Return type

int

force_timeout()

Trigger an immediate timeout, i.e. a “soft stop” of a run.

Added in version 9Oct2020.

This function allows to cleanly stop an ongoing run or minimization at the next loop iteration. This is a wrapper around the [`lammops\_force\_timeout\(\)`](#) function of the library interface.

property has_exceptions

Report whether the LAMMPS shared library was compiled with C++ exceptions handling enabled

This is a wrapper around the [`lammops\_config\_has\_exceptions\(\)`](#) function of the library interface.

Returns

state of C++ exception support

Return type

bool

property has_gzip_support

Report whether the LAMMPS shared library was compiled with support for reading and writing compressed files through gzip.

This is a wrapper around the [`lammops\_config\_has\_gzip\_support\(\)`](#) function of the library interface.

Returns

state of gzip support

Return type

bool

property has_png_support

Report whether the LAMMPS shared library was compiled with support for writing images in PNG format.

This is a wrapper around the [`lammops\_config\_has\_png\_support\(\)`](#) function of the library interface.

Returns

state of PNG support

Return type

bool

property has_jpeg_support

Report whether the LAMMPS shared library was compiled with support for writing images in JPEG format.

This is a wrapper around the [`lammops\_config\_has\_jpeg\_support\(\)`](#) function of the library interface.

Returns

state of JPEG support

Return type

bool

property has_ffmpeg_support

State of support for writing movies with ffmpeg in the LAMMPS shared library

This is a wrapper around the [`lammops\_config\_has\_ffmpeg\_support\(\)`](#) function of the library interface.

Returns

state of ffmpeg support

Return type

bool

property `has_curl_support`

Report whether the LAMMPS shared library was compiled with support for downloading files through libcurl.

This is a wrapper around the `lammps_config_has_curl_support()` function of the library interface.

Returns

state of CURL support

Return type

bool

`has_package(name)`

Report if the named package has been enabled in the LAMMPS shared library.

Added in version 3Nov2022.

This is a wrapper around the `lammps_config_has_package()` function of the library interface.

Parameters**name** (*string*) – name of the package**Returns**

state of package availability

Return type

bool

property `accelerator_config`

Return table with available accelerator configuration settings.

This is a wrapper around the `lammps_config_accelerator()` function of the library interface which loops over all known packages and categories and returns enabled features as a nested dictionary with all enabled settings as list of strings.

Returns

nested dictionary with all known enabled settings as list of strings

Return type

dictionary

property `has_gpu_device`

Availability of GPU package compatible device

This is a wrapper around the `lammps_has_gpu_device()` function of the C library interface.

Returns

True if a GPU package compatible device is present, otherwise False

Return type

bool

`get_gpu_device_info()`

Return a string with detailed information about any devices that are usable by the GPU package.

This is a wrapper around the `lammps_get_gpu_device_info()` function of the C-library interface.

Returns

GPU device info string

Return type

string

property installed_packages

List of the names of enabled packages in the LAMMPS shared library

This is a wrapper around the functions `lammps_config_package_count()` and `lammps_config_package_name()` of the library interface.

:return

has_style(category, name)

Returns whether a given style name is available in a given category

This is a wrapper around the function `lammps_has_style()` of the library interface.

Parameters

- **category** (*string*) – name of category
- **name** (*string*) – name of the style

Returns

true if style is available in given category

Return type

bool

available_styles(category)

Returns a list of styles available for a given category

This is a wrapper around the functions `lammps_style_count()` and `lammps_style_name()` of the library interface.

Parameters

category (*string*) – name of category

Returns

list of style names in given category

Return type

list

has_id(category, name)

Returns whether a given ID name is available in a given category

Added in version 9Oct2020.

This is a wrapper around the function `lammps_has_id()` of the library interface.

Parameters

- **category** (*string*) – name of category
- **name** (*string*) – name of the ID

Returns

true if ID is available in given category

Return type

bool

available_ids(*category*)

Returns a list of IDs available for a given category

Added in version 9Oct2020.

This is a wrapper around the functions `lammps_id_count()` and `lammps_id_name()` of the library interface.

Changed in version 22Jul2025.

This function has a different behavior for the “group” category: rather than only listing the available groups, it will return a full list with LMP_MAX_GROUP elements. This is because the list may have “holes” when groups are deleted. The returned list has either the name of the group or “None” for empty entries. This way, the value of `1 << idx` is the groupbit that can be compared to the per-atom “mask” property to determine if an atom is member of a group.

Parameters

category (*string*) – name of category

Returns

list of id names in given category

Return type

list

available_plugins(*category=None*)

Returns a list of plugins available for a given category

Added in version 10Mar2021.

This is a wrapper around the functions `lammps_plugin_count()` and `lammps_plugin_name()` of the library interface.

Returns

list of style/name pairs of loaded plugins

Return type

list

set_fix_external_callback(*fix_id, callback, caller=None*)

Set the callback function for a fix external instance with a given fix ID.

Optionally also set a reference to the calling object.

This is a wrapper around the `lammps_set_fix_external_callback()` function of the C-library interface. However this is set up to call a Python function with the following arguments.

- `object` is the value of the “caller” argument
- `ntimestep` is the current timestep
- `nlocal` is the number of local atoms on the current MPI process
- `tag` is a 1d NumPy array of integers representing the atom IDs of the local atoms
- `x` is a 2d NumPy array of doubles of the coordinates of the local atoms
- `f` is a 2d NumPy array of doubles of the forces on the local atoms that will be added

Changed in version 28Jul2021.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **callback** – Python function that will be called from fix external

- **caller** – reference to some object passed to the callback function

Type

string

Type

function

Type

object, optional

fix_external_get_force(*fix_id*)

Get access to the array with per-atom forces of a fix external instance with a given fix ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_get_force()` function of the C-library interface.

Parameters

fix_id – Fix-ID of a fix external instance

Type

string

Returns

requested data

Return type

ctypes.POINTER(ctypes.POINTER(ctypes.double))

fix_external_set_energy_global(*fix_id*, *eng*)

Set the global energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_energy_global()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eng** – potential energy value to be added by fix external

Type

string

Type

float

fix_external_set_virial_global(*fix_id*, *virial*)

Set the global virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_virial_global()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eng** – list of 6 floating point numbers with the virial to be added by fix external

Type

string

Type

float

fix_external_set_energy_peratom(*fix_id*, *eatom*)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_energy_peratom()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eatom** – list of potential energy values for local atoms to be added by fix external

Type

string

Type

float

fix_external_set_virial_peratom(*fix_id*, *vatom*)

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_virial_peratom()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **vatom** – list of natoms lists with 6 floating point numbers to be added by fix external

Type

string

Type

float

fix_external_set_vector_length(*fix_id*, *length*)

Set the vector length for a global vector stored with fix external for analysis

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_vector_length()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **length** – length of the global vector

Type

string

Type

int

fix_external_set_vector(*fix_id, idx, val*)

Store a global vector value for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_vector()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **idx** – 1-based index of the value in the global vector
- **val** – value to be stored in the global vector

Type

string

Type

int

Type

float

get_neighlist(*idx*)

Returns an instance of `NeighList` which wraps access to the neighbor list with the given index

See `lammops.numpy.get_neighlist()` if you want to use NumPy arrays instead of `c_int` pointers.

Parameters

idx (*int*) – index of neighbor list

Returns

an instance of `NeighList` wrapping access to neighbor list data

Return type

`NeighList`

get_neighlist_size(*idx*)

Return the number of elements in neighbor list with the given index

Parameters

idx (*int*) – neighbor list index

Returns

number of elements in neighbor list with index `idx`

Return type

int

get_neighlist_element_neighbors(*idx, element*)

Return data of neighbor list entry

Parameters

- **element** (*int*) – neighbor list index
- **element** – neighbor list element index

Returns

tuple with atom local index, number of neighbors and array of neighbor local atom indices

Return type

(int, int, POINTER(c_int))

find_pair_neighlist(*style*, *exact=True*, *nsub=0*, *reqid=0*)

Find neighbor list index of pair style neighbor list

Search for a neighbor list requested by a pair style instance that matches “style”. If *exact* is True, the pair style name must match exactly. If *exact* is False, the pair style name is matched against “style” as regular expression or sub-string. If the pair style is a hybrid pair style, the style is instead matched against the hybrid sub-styles. If the same pair style is used as sub-style multiple types, you must set *nsub* to a value *n* > 0 which indicates the *n*th instance of that sub-style to be used (same as for the *pair_coeff* command). The default value of 0 will fail to match in that case.

Once the pair style instance has been identified, it may have requested multiple neighbor lists. Those are uniquely identified by a request ID > 0 as set by the pair style. Otherwise the request ID is 0.

Parameters

- **style** (*string*) – name of pair style that should be searched for
- **exact** (*bool*, *optional*) – controls whether style should match exactly or only must be contained in pair style name, defaults to True
- **nsub** (*int*, *optional*) – match *nsub*-th hybrid sub-style, defaults to 0
- **reqid** (*int*, *optional*) – list request id, > 0 in case there are more than one, defaults to 0

Returns

neighbor list index if found, otherwise -1

Return type

int

find_fix_neighlist(*fixid*, *reqid=0*)

Find neighbor list index of fix neighbor list

The fix instance requesting the neighbor list is uniquely identified by the fix ID. In case the fix has requested multiple neighbor lists, those are uniquely identified by a request ID > 0 as set by the fix. Otherwise the request ID is 0 (the default).

Parameters

- **fixid** (*string*) – name of fix
- **reqid** (*int*, *optional*) – id of neighbor list request, in case there are more than one request, defaults to 0

Returns

neighbor list index if found, otherwise -1

Return type

int

find_compute_neighlist(*computeid*, *reqid=0*)

Find neighbor list index of compute neighbor list

The compute instance requesting the neighbor list is uniquely identified by the compute ID. In case the compute has requested multiple neighbor lists, those are uniquely identified by a request ID > 0 as set by the compute. Otherwise the request ID is 0 (the default).

Parameters

- **computeid** (*string*) – name of compute
- **reqid** (*int*, *optional*) – index of neighbor list request, in case there are more than one request, defaults to 0

Returns

neighbor list index if found, otherwise -1

Return type

int

class `lammops.numpy_wrapper.numpy_wrapper(lmp)`

lammops API NumPy Wrapper

This is a wrapper class that provides additional methods on top of an existing `lammops` instance. The methods transform raw ctypes pointers into NumPy arrays, which give direct access to the original data while protecting against out-of-bounds accesses.

There is no need to explicitly instantiate this class. Each instance of `lammops` has a `numpy` property that returns an instance.

Parameters

`lmp` (`lammops`) – instance of the `lammops` class

extract_atom(*name*, *dtype=None*, *nelem=None*, *dim=None*)

Retrieve per-atom properties from LAMMPS as NumPy arrays

This is a wrapper around the `lammops.extract_atom()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Note

The returned vectors or arrays of per-atom data are dimensioned according to the return value of `lammops.extract_atom_size()`. Except for the “mass” property, the underlying storage will always be dimensioned for the range `[0:nmax]`. The actual usable data may be only in the range `[0:nlocal]` or `[0:nlocal][0:dim]`. Whether there is valid data in the range `[nlocal:nlocal+nghost]` or `[nlocal:local+nghost][0:dim]` depends on whether the property of interest is also updated for ghost atoms. Also the value of *dim* depends on the value of *name*. By using the optional *nelem* and *dim* parameters the dimensions of the returned NumPy array can be overridden. There is no check whether the number of elements chosen is valid.

Parameters

- **name** (*string*) – name of the property
- **dtype** (*int*, *optional*) – type of the returned data (see [Data Types](#))
- **nelem** (*int*, *optional*) – number of elements in array
- **dim** (*int*, *optional*) – dimension of each element

Returns

requested data as NumPy array with direct access to C data or None

Return type

numpy.array or NoneType

extract_compute(*cid*, *cstyle*, *ctype*)

Retrieve data from a LAMMPS compute

This is a wrapper around the `lammops.extract_compute()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Parameters

- **cid** (*string*) – compute ID
- **cstyle** (*int*) – style of the data retrieve (global, atom, or local), see [Style Constants](#)
- **ctype** (*int*) – type of the returned data (scalar, vector, or array), see [Type Constants](#)

Returns

requested data either as float, as NumPy array with direct access to C data, or None

Return type

float, numpy.array, or NoneType

extract_fix(*fid*, *fstyle*, *fctype*, *nrow*=0, *ncol*=0)

Retrieve data from a LAMMPS fix

This is a wrapper around the `lammops.extract_fix()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Note

When requesting global data, the fix data can only be accessed one item at a time without access to the whole vector or array. Thus this function will always return a scalar. To access vector or array elements the “nrow” and “ncol” arguments need to be set accordingly (they default to 0).

Parameters

- **fid** (*string*) – fix ID
- **fstyle** (*int*) – style of the data retrieve (global, atom, or local), see [Style Constants](#)
- **fctype** (*int*) – type or size of the returned data (scalar, vector, or array), see [Type Constants](#)
- **nrow** (*int*) – index of global vector element or row index of global array element
- **ncol** (*int*) – column index of global array element

Returns

requested data

Return type

integer or double value, pointer to 1d or 2d double array or None

extract_variable(*name*, *group*=None, *vartype*=0)

Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function `lammops.extract_variable()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Parameters

- **name** (*string*) – name of the variable to execute
- **group** (*string*) – name of group for atom-style variable (ignored for equal-style variables)
- **vartype** (*int*) – type of variable, see [Variable Type Constants](#)

Returns

the requested data or None

Return type

c_double, numpy.array, or NoneType

gather_bonds()

Retrieve global list of bonds as a NumPy array

Added in version 28Jul2021.

This is a wrapper around `lammops.gather_bonds()`. It behaves the same as the original method, but returns a NumPy array instead of a `ctypes` list.

Returns

the requested data as a 2d-integer numpy array

Return type

`numpy.array(nbonds,3)`

gather_angles()

Retrieve global list of angles as a NumPy array

Added in version 8Feb2023.

This is a wrapper around `lammops.gather_angles()`. It behaves the same as the original method, but returns a NumPy array instead of a `ctypes` list.

Returns

the requested data as a 2d-integer numpy array

Return type

`numpy.array(nangles,4)`

gather_dihedrals()

Retrieve global list of dihedrals as a NumPy array

Added in version 8Feb2023.

This is a wrapper around `lammops.gather_dihedrals()`. It behaves the same as the original method, but returns a NumPy array instead of a `ctypes` list.

Returns

the requested data as a 2d-integer numpy array

Return type

`numpy.array(ndihedrals,5)`

gather_impropers()

Retrieve global list of impropers as a NumPy array

Added in version 8Feb2023.

This is a wrapper around `lammops.gather_impropers()`. It behaves the same as the original method, but returns a NumPy array instead of a `ctypes` list.

Returns

the requested data as a 2d-integer numpy array

Return type

`numpy.array(nimpropers,5)`

fix_external_get_force(fix_id)

Get access to the array with per-atom forces of a fix external instance with a given fix ID.

Changed in version 28Jul2021.

This function is a wrapper around the `lammops.fix_external_get_force()` method. It behaves the same as the original method, but returns a NumPy array instead of a `ctypes` pointer.

Parameters

fix_id – Fix-ID of a fix external instance

Type

string

Returns

requested data

Return type

numpy.array

fix_external_set_energy_peratom(*fix_id*, *eatom*)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This function is an alternative to `lammops.fix_external_set_energy_peratom()` method. It behaves the same as the original method, but accepts a NumPy array instead of a list as argument.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eatom** – per-atom potential energy

Type

string

Type

numpy.array

fix_external_set_virial_peratom(*fix_id*, *vatom*)

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This function is an alternative to `lammops.fix_external_set_virial_peratom()` method. It behaves the same as the original method, but accepts a NumPy array instead of a list as argument.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eatom** – per-atom potential energy

Type

string

Type

numpy.array

get_neighlist(*idx*)

Returns an instance of `NumPyNeighList` which wraps access to the neighbor list with the given index

Parameters

idx (*int*) – index of neighbor list

Returns

an instance of `NumPyNeighList` wrapping access to neighbor list data

Return type

`NumPyNeighList`

get_neighlist_element_neighbors(*idx, element*)

Return data of neighbor list entry

This function is a wrapper around the function `lammops.get_neighlist_element_neighbors()` method. It behaves the same as the original method, but returns a NumPy array containing the neighbors instead of a ctypes pointer.

Parameters

- **element** (*int*) – neighbor list index
- **element** – neighbor list element index

Returns

tuple with atom local index and numpy array of neighbor local atom indices

Return type

(int, numpy.array)

iarray(*c_int_type, raw_ptr, nelem, dim=1*)

Convert ctypes pointer to an array of integers into a corresponding numpy array

This will cast the raw pointer into a 1-d or 2-d numpy array and set its shape

Parameters

- **c_int_type** – type of integer (c_int32 or c_int64)
- **raw_ptr** – ctypes pointer to the array data
- **nelem** – length of the leading dimension
- **dim** – length of the second dimension

Type

ctypes type

Type

POINTER(c_int_type)

Type

integer

Type

integer, optional

Returns

ctypes array converted to numpy style array with proper shape

Return type

numpy.array

darray(*raw_ptr, nelem, dim=1*)

Convert ctypes pointer to an array of doubles into a corresponding numpy array

This will cast the raw pointer into a 1-d or 2-d numpy array and set its shape

Parameters

- **raw_ptr** – ctypes pointer to the array data
- **nelem** – length of the leading dimension
- **dim** – length of the second dimension

Type
POINTER(c_double)

Type
integer

Type
integer, optional

Returns
ctypes array converted to numpy style array with proper shape

Return type
numpy.array

class `lammips.ipython.wrapper(lmp)`

lammips API IPython Wrapper

This is a wrapper class that provides additional methods on top of an existing `lammips` instance. It provides additional methods that allow create and/or embed visualizations created by native LAMMPS commands.

There is no need to explicitly instantiate this class. Each instance of `lammips` has a `ipython` property that returns an instance.

Parameters

lmp (`lammips`) – instance of the `lammips` class

image (`filename='snapshot.png', group='all', color='type', diameter='type', size=None, view=None, center=None, up=None, zoom=1.0, background_color='white'`)

Generate image using `write_dump` command and display it

See `dump image` for more information.

Parameters

- **filename** (`string`) – Name of the image file that should be generated. The extension determines whether it is PNG or JPEG
- **group** (`string`) – the group of atoms `write_image` should use
- **color** (`string`) – name of property used to determine color
- **diameter** (`string`) – name of property used to determine atom diameter
- **size** (`tuple (width, height)`) – dimensions of image
- **view** (`tuple (theta, phi)`) – view parameters
- **center** (`tuple (flag, center_x, center_y, center_z)`) – center parameters
- **up** (`tuple (up_x, up_y, up_z)`) – vector pointing to up direction
- **zoom** (`float`) – zoom factor
- **background_color** (`string`) – background color of scene

Returns
Image instance used to display image in notebook

Return type
`IPython.core.display.Image`

video (`filename`)

Load video from file

Can be used to visualize videos from `dump movie`.

Parameters

filename (*string*) – Path to video file

Returns

HTML Video Tag used by notebook to embed a video

Return type

IPython.display.HTML

2.4.2 Additional components of the `lammops` module

The `lammops` module additionally contains several constants and the `NeighList` class:

Data Types

`LAMMPS_INT`, `LAMMPS_INT_2D`, `LAMMPS_DOUBLE`, `LAMMPS_DOUBLE_2D`, `LAMMPS_INT64`, `LAMMPS_INT64_2D`, `LAMMPS_STRING`

Constants in the `lammops` module to indicate how to cast data when the C library function returns a void pointer. Used in `lammops.extract_global()` and `lammops.extract_atom()`. See `_LMP_DATATYPE_CONST` for the equivalent constants in the C library interface.

Style Constants

`LMP_STYLE_GLOBAL`, `LMP_STYLE_ATOM`, `LMP_STYLE_LOCAL`

Constants in the `lammops` module to select what style of data to request from computes or fixes. See `_LMP_STYLE_CONST` for the equivalent constants in the C library interface. Used in `lammops.extract_compute()`, `lammops.extract_fix()`, and their NumPy variants `lammops.numpy.extract_compute()` and `lammops.numpy.extract_fix()`.

Type Constants

`LMP_TYPE_SCALAR`, `LMP_TYPE_VECTOR`, `LMP_TYPE_ARRAY`, `LMP_SIZE_VECTOR`, `LMP_SIZE_ROWS`, `LMP_SIZE_COLS`

Constants in the `lammops` module to select what type of data to request from computes or fixes. See `_LMP_TYPE_CONST` for the equivalent constants in the C library interface. Used in `lammops.extract_compute()`, `lammops.extract_fix()`, and their NumPy variants `lammops.numpy.extract_compute()` and `lammops.numpy.extract_fix()`.

Variable Type Constants

`LMP_VAR_EQUAL`, `LMP_VAR_ATOM`

Constants in the `lammops` module to select what type of variable to query when calling `lammops.extract_variable()`. See also: *variable command*.

Classes representing internal objects

`class lammops.NeighList(lmp, idx)`

This is a wrapper class that exposes the contents of a neighbor list.

It can be used like a regular Python list. Each element is a tuple of:

- the atom local index
- its number of neighbors
- and a pointer to an `c_int` array containing local atom indices of its neighbors

Internally it uses the lower-level LAMMPS C-library interface.

Parameters

- **imp** (*lammps*) – reference to instance of *lammps*
- **idx** (*int*) – neighbor list index

property size

Returns

number of elements in neighbor list

get(*element*)

Access a specific neighbor list entry. “element” must be a number from 0 to the size-1 of the list

Returns

tuple with atom local index, number of neighbors and ctypes pointer to neighbor’s local atom indices

Return type

(int, int, ctypes.POINTER(c_int))

find(*iatom*)

Find the neighbor list for a specific (local) atom iatom. If there is no list for iatom, (-1, None) is returned.

Returns

tuple with number of neighbors and ctypes pointer to neighbor’s local atom indices

Return type

(int, ctypes.POINTER(c_int))

class *lammps*.numpy_wrapper.NumpyNeighList(*imp*, *idx*)

This is a wrapper class that exposes the contents of a neighbor list.

It can be used like a regular Python list. Each element is a tuple of:

- the atom local index
- a NumPy array containing the local atom indices of its neighbors

Internally it uses the lower-level LAMMPS C-library interface.

Parameters

- **imp** (*lammps*) – reference to instance of *lammps*
- **idx** (*int*) – neighbor list index

get(*element*)

Access a specific neighbor list entry. “element” must be a number from 0 to the size-1 of the list

Returns

tuple with atom local index, numpy array of neighbor local atom indices

Return type

(int, numpy.array)

find(*iatom*)

Find the neighbor list for a specific (local) atom iatom. If there is no list for iatom, None is returned.

Returns

numpy array of neighbor local atom indices

Return type

numpy.array or None

2.5 Extending the Python interface

As noted previously, most of the *lammops* Python class methods correspond one-to-one with the functions in the LAMMPS library interface in `src/library.cpp` and `library.h`. This means you can extend the Python wrapper by following these steps:

- Add a new interface function to `src/library.cpp` and `src/library.h`.
- Rebuild LAMMPS as a shared library.
- Add a wrapper method to `python/lammops/core.py` for this interface function.
- Define the corresponding `argtypes` list and `restype` in the `lammops.__init__()` function.
- Re-install the shared library and the python module, if needed
- You should now be able to invoke the new interface function from a Python script.

2.6 Calling Python from LAMMPS

LAMMPS has several commands which can be used to invoke Python code directly from an input script:

- *python*
- *python-style variables*
- *equal-style and atom-style variables with formulas containing Python function wrappers*
- *fix python/invoke*
- *pair_style python*

The *python* command can be used to define and execute a Python function that you write the code for. The Python function can also be assigned to a LAMMPS python-style variable via the *variable* command. Each time the variable is evaluated, either in the LAMMPS input script itself, or by another LAMMPS command that uses the variable, this will trigger the Python function to be invoked.

The Python function can also be referenced in the formula used to define an *equal-style or atom-style variable*, using the syntax for a *Python function wrapper*. This make it easy to pass LAMMPS-related arguments to the Python function, as well as to invoke it whenever the equal- or atom-style variable is evaluated. For an atom-style variable it means the Python function can be invoked once per atom, using per-atom properties as arguments to the function.

The Python code for the function can be included directly in the input script or in an auxiliary file. The function can have arguments which are mapped to LAMMPS variables (also defined in the input script) and it can return a value to a LAMMPS variable. This is thus a mechanism for your input script to pass information to a piece of Python code, ask Python to execute the code, and return information to your input script.

Note that a Python function can be arbitrarily complex. It can import other Python modules, instantiate Python classes, call other Python functions, etc. The Python code that you provide can contain more code than the single function. It can contain other functions or Python classes, as well as global variables or other mechanisms for storing state between calls from LAMMPS to the function.

The Python function you provide can consist of “pure” Python code that only performs operations provided by standard Python. However, the Python function can also “call back” to LAMMPS through its Python-wrapped library interface, in the manner described in the *Python run* doc page. This means it can issue LAMMPS input script commands or query and set internal LAMMPS state. As an example, this can be useful in an input script to create a more complex loop with branching logic, than can be created using the simple looping and branching logic enabled by the *next* and *if* commands.

See the [python](#) page and the [variable](#) doc page for its python-style variables for more info, including examples of Python code you can write for both pure Python operations and callbacks to LAMMPS.

2.7 Output Readers

The Python package contains the `lammops.formats` module, which provides classes to post-process some of the output files generated by LAMMPS.

Output formats for LAMMPS python module Written by Richard Berger <richard.berger@outlook.com> and Axel Kohlmeyer <akohlmey@gmail.com>

class `lammops.formats.LogFile(filename)`

Reads LAMMPS log files and extracts the thermo information

It supports the line, multi, and yaml thermo output styles.

Parameters

filename (*str*) – path to log file

Variables

- **runs** – List of LAMMPS runs in log file. Each run is a dictionary with thermo fields as keys, storing the values over time
- **errors** – List of error lines in log file

class `lammops.formats.AvgChunkFile(filename)`

Reads files generated by fix ave/chunk

Parameters

filename (*str*) – path to ave/chunk file

Variables

- **timesteps** – List of timesteps stored in file
- **total_count** – total count over time
- **chunks** – List of chunks. Each chunk is a dictionary containing its ID, the coordinates, and the averaged quantities

2.8 Example Python scripts

The `python/examples` directory has Python scripts which show how Python can run LAMMPS, grab data, change it, and put it back into LAMMPS.

These are the Python scripts included as demos in the `python/examples` directory of the LAMMPS distribution, to illustrate the kinds of things that are possible when Python wraps LAMMPS. If you create your own scripts, send them to us and we can include them in the LAMMPS distribution.

<code>trivial.py</code>	read/run a LAMMPS input script through Python
<code>demo.py</code>	invoke various LAMMPS library interface routines
<code>simple.py</code>	run in parallel, similar to <code>examples/COUPLE/simple/simple.cpp</code>
<code>split.py</code>	same as <code>simple.py</code> but running in parallel on a subset of procs
<code>gui.py</code>	GUI go/stop/temperature-slider to control LAMMPS
<code>plot.py</code>	real-time temperature plot with GnuPlot via Pizza.py
<code>viz_TOOL.py</code>	real-time viz via some viz package
<code>vizplotgui_TOOL.py</code>	combination of <code>viz_TOOL.py</code> and <code>plot.py</code> and <code>gui.py</code>

For the `viz_TOOL.py` and `vizplotgui_TOOL.py` commands, replace `TOOL` with `gl` or `atomeye` or `pymol` or `vmd`, depending on what visualization package you have installed.

Note that for GL, you need to be able to run the Pizza.py GL tool, which is included in the `pizza` subdirectory. See the Pizza.py doc pages for more info:

- <https://lammmps.github.io/pizza/>

Note that for AtomEye, you need version 3, and there is a line in the scripts that specifies the path and name of the executable. See the AtomEye web pages for more details:

- <http://li.mit.edu/Archive/Graphics/A/>
- <http://li.mit.edu/Archive/Graphics/A3/A3.html>

The latter link is to AtomEye 3 which has the scripting capability needed by these Python scripts.

Note that for PyMol, you need to have built and installed the open-source version of PyMol in your Python, so that you can import it from a Python script. See the PyMol web pages for more details:

- <https://www.pymol.org>
- <https://github.com/schrodinger/pymol-open-source>

The latter link is to the open-source version.

Note that for VMD, you need a fairly current version (1.8.7 works for me) and there are some lines in the `pizza/vmd.py` script for 4 PIZZA variables that have to match the VMD installation on your system.

See the `python/README` file for instructions on how to run them and the source code for individual scripts for comments about what they do.

Here are screenshots of the `vizplotgui_tool.py` script in action for different visualization package options:

2.9 Using LAMMPS in IPython notebooks and Jupyter

If the LAMMPS Python package is installed for the same Python interpreter as [IPython](#), you can use LAMMPS directly inside of an IPython notebook inside of Jupyter. [Jupyter](#) is a powerful integrated development environment (IDE) for many dynamic languages like [Python](#), [Julia](#) and others, which operates inside of any web browser. Besides auto-completion and syntax highlighting it allows you to create formatted documents using Markup, mathematical formulas, graphics and animations intermixed with executable Python code. It is a great format for tutorials and showcasing your latest research.

The easiest way to install it is via `pip` from <https://pypi.org/>:

```
pip install --user jupyter
```

To launch an instance of Jupyter simply run the following command inside your Python environment:

jupyter notebook

2.9.1 Interactive Python Examples

Examples of IPython notebooks can be found in the `python/examples/ipython` subdirectory. They require LAMMPS to be compiled as shared library with PYTHON, PNG, JPEG and FFMPEG support.

To open these notebooks launch `jupyter notebook index.ipynb` inside this directory. The opened file provides an overview of the available examples.

- Example 1: Using LAMMPS with Python (`simple.ipynb`)
- Example 2: Analyzing LAMMPS thermodynamic data (`thermo.ipynb`)
- Example 3: Working with Per-Atom Data (`atoms.ipynb`)
- Example 4: Working with LAMMPS variables (`variables.ipynb`)
- Example 5: Validating a dihedral potential (`dihedrals/dihedral.ipynb`)
- Example 6: Running a Monte Carlo relaxation (`montecarlo/mc.ipynb`)

Note

Typically clicking a link in Jupyter will open a new tab, which might be blocked by your pop-up blocker.

2.10 Handling LAMMPS errors

LAMMPS and the LAMMPS library are compiled with *C++ exception support* to provide a better error handling experience. LAMMPS errors trigger throwing a C++ exception. These exceptions allow capturing errors on the C++ side and rethrowing them on the Python side. This way LAMMPS errors can be handled through the Python exception handling mechanism.

```
from lammps import lammps, MPIAbortException

lmp = lammps()

try:
    # LAMMPS will normally terminate itself and the running process if an error
    # occurs. This would kill the Python interpreter. The library wrapper will
    # detect that an error has occurred and throw a Python exception

    lmp.command('unknown')
except MPIAbortException as ae:
    # Single MPI process got killed. This would normally be handled by an MPI abort
    pass
except Exception as e:
    # All (MPI) processes have reached this error
    pass
```

Warning

Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible when running in parallel with MPI.

2.11 Troubleshooting

2.11.1 Testing if Python can launch LAMMPS

To test if LAMMPS is callable from Python, launch Python interactively and type:

```
>>> from lammps import lammps
>>> lmp = lammps()
```

If you get no errors, you're ready to use LAMMPS from Python. If the second command fails, the most common error to see is

```
OSError: Could not load LAMMPS dynamic library
```

which means Python was unable to load the LAMMPS shared library. This typically occurs if the system can't find the LAMMPS shared library or one of the auxiliary shared libraries it depends on, or if something about the library is incompatible with your Python. The error message should give you an indication of what went wrong.

If your shared library uses a suffix, such as `liblammps_mpi.so`, change the constructor call as follows (see [Creating or deleting a LAMMPS object](#) for more details):

```
>>> lmp = lammps(name='mpi')
```

You can also test the load directly in Python as follows, without first importing from the `lammps` module:

```
>>> from ctypes import CDLL
>>> CDLL("liblammps.so")
```

If an error occurs, carefully go through the steps in [Installing the LAMMPS Python Module and Shared Library](#) and on the [Build_basics](#) page about building a shared library.

If you are not familiar with [Python](#), it is a powerful scripting and programming language which can do almost everything that compiled languages like C, C++, or Fortran can do in fewer lines of code. It also comes with a large collection of add-on modules for many purposes (either bundled or easily installed from Python code repositories). The major drawback is slower execution speed of the script code compared to compiled programming languages. But when the script code is interfaced to optimized compiled code, performance can be on par with a standalone executable, for as long as the scripting is restricted to high-level operations. Thus Python is also convenient to use as a “glue” language to “drive” a program through its library interface, or to hook multiple pieces of software together, such as a simulation code and a visualization tool, or to run a coupled multi-scale or multi-physics model.

See the [Coupling LAMMPS to other codes](#) page for more ideas about coupling LAMMPS to other codes. See the [LAMMPS Library Interfaces](#) page for a description of the LAMMPS library interfaces. That interface is exposed to Python either when calling LAMMPS from Python or when calling Python from a LAMMPS input script and then calling back to LAMMPS from Python code. The C-library interface is designed to be easy to add functionality to, thus the Python interface to LAMMPS is easy to extend as well.

If you create interesting Python scripts that run LAMMPS or interesting Python functions that can be called from a LAMMPS input script, that you think would be generally useful, please post them as a pull request to our [GitHub site](#), and they can be added to the LAMMPS distribution or web page.

MODIFYING & EXTENDING LAMMPS

LAMMPS has a modular design, so that it is easy to modify or extend with new functionality. In fact, about 95% of its source code is optional. The following pages give basic instructions on adding new features to LAMMPS. More in-depth explanations and documentation of individual functions and classes are given in [Information for Developers](#).

If you add a new feature to LAMMPS and think it will be of general interest to other users, we encourage you to submit it for inclusion in LAMMPS. This process is explained in the following three pages:

- [how to prepare and submit your code](#)
- [requirements for submissions](#)
- [style guidelines](#)

A summary description of various types of styles in LAMMPS follows. A discussion of implementing specific styles from scratch is given in [writing new styles](#).

3.1 Overview

The best way to add a new feature to LAMMPS is to find a similar feature and look at the corresponding source and header files to figure out what it does. You will need some knowledge of C++ to understand the high-level structure of LAMMPS and its class organization. Functions (class methods) that do actual computations are mostly written in C-style code and operate on simple C-style data structures (vectors and arrays). A high-level overview of the programming style choices in LAMMPS is [given elsewhere](#).

Most of the new features described on the [Modify](#) doc page require you to write a new C++ derived class (excluding exceptions described below, this can often be done by making small edits to existing files). Creating a new class requires 2 files, a source code file (*.cpp) and a header file (*.h). The derived class must provide certain methods to work as a new option. Depending on how different your new feature is compared to existing features, you can either derive from the base class itself, or from a derived class that already exists. Enabling LAMMPS to invoke the new class is as simple as putting the two source files in the src directory and re-building LAMMPS.

The advantage of C++ and its object-orientation is that all the code and variables needed to define the new feature are in the 2 files you write. Thus, it should not make the rest of LAMMPS more complex or cause bugs through unwanted side effects.

Here is a concrete example. Suppose you write 2 files `pair_foo.cpp` and `pair_foo.h` that define a new class `PairFoo` which computes pairwise potentials described in the classic 1997 [paper](#) by Foo, *et al.* If you wish to invoke those potentials in a LAMMPS input script with a command like:

```
pair_style foo 0.1 3.5
```

then your `pair_foo.h` file should be structured as follows:

```
#ifdef PAIR_CLASS
// clang-format off
PairStyle(foo,PairFoo);
#else
// clang-format on
...
(class definition for PairFoo)
...
#endif
```

where “foo” is the style keyword in the pair_style command, and PairFoo is the class name defined in your pair_foo.cpp and pair_foo.h files.

When you re-build LAMMPS, your new pairwise potential becomes part of the executable and can be invoked with a pair_style command like the example above. Arguments like 0.1 and 3.5 can be defined and processed by your new class.

As illustrated by this example, many features referred to in the LAMMPS documentation are called a “style” of a particular command.

The *Modify page* lists all the common styles in LAMMPS, and discusses the header file for the base class that these styles derive from. Public variables in that file can be used and set by the derived classes, and may also be used by the base class. Sometimes they are also accessed by the rest of LAMMPS. Pure functions, which means functions declared as virtual in the base class header file and which are also set to 0, are functions you **must** implement in your new derived class to give it the functionality LAMMPS expects. Virtual functions that are not set to 0 are functions you may override or not. Those are usually defined with an empty function body.

Additionally, new output options can be added directly to the thermo.cpp, dump_custom.cpp, and variable.cpp files. These are also listed on the *Modify page*.

Here are additional guidelines for modifying LAMMPS and adding new functionality:

- Think about whether what you want to do would be better as a pre- or post-processing step. Many computations are more easily and more quickly done that way.
- Do not try to do anything within the timestepping of a run that is not parallel. For example, do not accumulate a bunch of data on a single processor and analyze it. That would run the risk of seriously degrading the parallel efficiency.
- If your new feature reads arguments or writes output, make sure you follow the unit conventions discussed by the *units* command.

(Foo) Foo, Morefoo, and Maxfoo, J of Classic Potentials, 75, 345 (1997).

3.2 Submitting new features for inclusion in LAMMPS

We encourage LAMMPS users to submit new features they write for LAMMPS to be included in the LAMMPS distribution and thus become easily accessible to all LAMMPS users. The LAMMPS source code is managed with git and public development is hosted on [GitHub](#). You can monitor the repository to be notified of releases, follow the ongoing development, and comment on topics of interest to you.

This section contains general information regarding the preparation and submission of new features to LAMMPS. If you are new to development in LAMMPS, we recommend you read one of the tutorials on developing a new *pair style* or *fix style* which provide a friendly introduction to what LAMMPS development entails and common vocabulary used on this section.

3.2.1 Communication with the LAMMPS developers

For any larger modifications or programming project, you are encouraged to contact the LAMMPS developers ahead of time to discuss implementation strategies. That will make it easier to integrate your contribution and typically results in less work for everyone involved. You are also encouraged to search through the list of [open issues on GitHub](#) and submit a new issue for a planned feature, to avoid duplicating work (and possibly being scooped).

For informal communication with the LAMMPS developers, you may ask to join the [LAMMPS developers on Slack](#). This slack work space is by invitation only. For access, please send an e-mail to slack@lammips.org explaining what part of LAMMPS you are working on. Only discussions related to LAMMPS development are tolerated in that work space, so this is **NOT** for people looking for help with compiling, installing, or using LAMMPS. Please post a message to the [LAMMPS forum](#) for those purposes.

3.2.2 Time and effort required
